While each branch of military service has its own unique culture, the four major services all subscribe to several overarching tenets. All of the services use basic training to indoctrinate new members with their service culture and impart basic skills, have a hierarchical organization, are oriented toward youth through a personnel system that limits the maximum age of service members, and forces them out of the service if they don't receive regular promotions. Members of combat specialties dominate all of the services, each of which aspires to be a meritocracy. Promotions in American military organizations are handled through a central system of impartial boards working from a fixed set of objective and subjective criteria, including the numbers of positions available at each grade.

U.S. Air Force Culture

As the youngest of the four services, the culture of the USAF bears the marks of both its arena of combat and the battles its leaders waged to become an independent service. Technology is the most important object in air force culture. Indeed, its pilots identify more readily with the specific type of aircraft they fly rather than the service itself. USAF leaders will accept dramatic reductions to the number of aircraft

wings, bases, and personnel to ensure that their aircraft are the most advanced in the world. The service organizes itself into communities grouped around different platforms: the bomber community, the "fighter mafia," the strategic transport, and the missile force. While the bomber community was dominant in the aftermath of World War II, tactical fighter organizations now dominate the air force. Twenty-first-century global deployments have increased the status of the transport aircraft; the end of the Cold War had reduced the status of the missile force.

The air force's fight during the 1930s and 1940s to become an independent service continues to color its relationships with other services. Its operational foundation is that air superiority is a precondition for all other activities in modern warfare. More than this, the quest for institutional independence drove the air force to base all of its arguments for strategy based on the doctrine of strategic bombardment. While evidence from Europe showed that bombardment contributed to the Allied victory over Germany during World War II with attacks on transportation and fuel complexes, it did not live up to the grandiose prewar claims of Brigadier General Billy Mitchell. The development of the atomic bomb in 1945 appeared to support air force doctrine, even if strategic bombing was not decisive during the Korean War. The air force's early domination of nuclear weapons delivery allowed it to argue that it deserved the largest share of defense spending and that the other services were no longer needed for national defense.

U.S. Army Culture

Unlike its younger sibling, the army focuses less on technology than on people. Where the air force obsesses about technological superiority, the army defines itself in terms of the number of soldiers it fields and on their skills in the art of war. Unlike the air force or the navy, the army is used to fluctuations in its size, a reflection of the small professional army of the 19th and early 20th centuries that fought irregular campaigns and trained expeditionary forces as needed. Like the air force, the army creates subdivisions based on branch of service. Soldiers identify with their branch—infantry, artillery, armor, combat engineers, and so on—but rather than creating a hierarchy based on the perception of which branch

is most important, the army's culture recognizes that to fulfill its mission, all of its branches are necessary. Although members who served in the combat arms dominate the highest levels of leadership, even the support branches are vital to the army's function. The lack of hierarchy among branches is illustrated by the army practice of general officers removing their branch insignia when promoted from colonel.

The army's ideals are those of selfless service to the nation. Rather than a specific technology or doctrine, the army most closely identifies itself with its long traditions and roots in the citizenry of the United States. Because it relies on the USAF and USN for transportation and support to fulfill its missions, the army is the most comfortable of all the services in joint operations.

U.S. Navy Culture

The USN shares the USAF's affinity for technology because merely surviving at sea requires sailors to rely on their ships. Unlike the air force, however, the navy's culture focuses on tradition and independence. For most of its long history, the USN operated out of communication with civilian or military leaders when it set out to complete its mission. Before the advent of satellite communications, once a ship sailed beyond the horizon, it was beyond help or recall until making landfall once more. This meant that regardless of rank, the captain of a ship has a far higher level of personal authority than the commander of an equivalently sized unit in the other services.

Of all the services, the USN is the most concerned with its size as measured in the size of its fleet and the number of capital ships that it contains. Although the nature of the capital ship has changed since World War II from onboard aircraft carriers or submarines instead of battleships, the navy's requirement for the number of capital ships remained static from the 1940s through 1990. Despite measuring the navy itself in terms of vessels, members of the navy are more likely to identify with the navy as an institution than with a specific ship or type of ship, as is the case with air force pilots.

Like the army and the air force, the navy has institutional subcultures based on officers' specialties—with submarine, surface warfare, and aviation the most dominant. These three specialties form the basis for a finely delimited hierarchy within the USN. Pecking orders within specialties are carefully

defined. Within the aviation community, precedence is given to carrier pilots over land-based pilots and to fighter pilots over the pilots of all other aircraft. Similarly, officers serving on attack submarines that hunt enemy submarines or ships rank above officers of ballistic missile submarines in the hierarchy.

The navy is less reliant on formal doctrine than the army or the air force. Roger W. Barnett argues that the constantly changing nature of ocean conditions and the greatly varied locales, potential opponents, and missions that the navy must allow for cause the USN to prefer to base its methods of fighting on the context in which it operates. This separates it from the air force's emphasis on prescribed methods for fighting wars, such as an emphasis on strategic bombing or specific doctrines like the U.S. Army's AirLand Battle doctrine developed for use in Central Europe from 1976 to 1990.

The historian Alfred Thayer Mahan's (1840–1914) strategic philosophy argued that navies must control the seas to pursue national objectives ranging from commerce to defense and diplomacy. To do this, Mahan argued that the proper objective of the navy was enemy fleets. After defeating the enemy's fleets, the USN could attack the enemy's commerce and coastlines, and the United States could deploy troops with impunity. Unified fleets of capital ships were necessary to accomplish the destruction of the enemy, as was control of coaling stations and key geographic features.

Although the USN developed submarines for commerce raiding after World War I, it remained wedded to the Mahanian strategy, which continued to influence naval policy, through the end of World War II. The postwar era witnessed radical changes in navy philosophy regarding capital ships. Due to the flexibility and range of carrier aviation, aircraft carriers emerged from World War II as the preeminent capital ships. The USN's Carrier Strike Groups not only provide control of the seas in the Mahanian sense but also provide the United States with power project capability to influence events far from land using aircraft and cruise missiles. During the Cold War, ballistic missile submarines provided nuclear deterrence and strike capabilities as part of the nuclear triad, which combined the use of strategic bombers, submarine-launched ballistic missiles, and land-based intercontinental ballistic missiles to enable nuclear forces to survive a surprise attack. In the 21st century, the USN entered into the arena of

homeland security as part of national missile defense programs and coastal surveillance duties.

U.S. Marine Corps Culture

Of all of the branches of the U.S. military, the U.S. Marine Corps has the strongest and most distinctive culture. Along with the corps' small size, the marines cherish their sense of uniqueness and their faith in each other, the corps, and the nation. The Marine Corps's motto *Semper Fidelis*, "always faithful," exemplifies this *mentalité* of cohesion, family, and service. Further enhancing this image of group cohesion are the prescriptions that "every Marine a rifleman," and that "once a Marine, always a Marine."

Before World War II, the Marine Corps was an effective light infantry force that fought America's small wars from North Africa to South America. Two realities combined to create the Marine Corps's postwar structure. Like the USAF, the Marine Corps continually feels the need to justify its existence due to the army's occasional claim that it and the Marine Corps serve the same functions. In response, the Marine Corps positions itself as a more elite fighting force than the army, with better personnel. In effect, the marines' response to the army's encroachment was to assert that they were a superior option. The result is that the Marine Corps defines itself in terms of its relationship with the U.S. Army.

World War II also provided the Marine Corps a specific doctrine for fighting. The Navy-Marine Corps joint doctrine of amphibious warfare shaped U.S. strategy during the Central Pacific campaign, providing the Marine Corps key elements of its culture. During this campaign, marine leaders developed a preference for short, aggressive battles. While some engagements required frontal assaults, marine officers like Colonel Lewis Burwell "Chesty" Puller preferred the momentum offered by close fighting along a defined front, even when able to attack a flank, as in the Battle of Peleliu.

The modern Marine Corps remains small, never more than two corps in size, and organized into three Marine Expeditionary Forces that each include infantry, support, and aviation elements. Unlike the army, the Marine Corps operates its own fixed-wing aircraft for close air support, providing it more flexibility than the army has. Its small size and deployment patterns, as well as economic costs, led the Marine Corps to rely on younger personnel who

spend less time in uniform than the other services. Half of all marines are on their first deployment. The Marine Corps also has fewer female personnel than any of the other services.

Joint Operations and Cooperation

While the services' individual cultures are critical to their success, they can also be obstacles to efficiency and operational effectiveness. With few notable exceptions such as U.S. Army-Army Air Forces combined arms operations in North Africa, and Army Air Forces use of skip bombing and troop transport in the Pacific during World War II, the services tended to fight their wars without cooperation with other services. During World War II and the Korean War, the U.S. Army complained that close air support was not a priority for airmen, leading air force leaders to argue during the Korean War that the army was better off relying on field artillery for support. These issues of cooperation evolved out of the services' parochialism regarding others' needs and missions.

The Vietnam War witnessed a renaissance of close air support coordination between the army and the air force. Disagreements over centralized control of aviation assets continued, but soldiers and marines were happy with the quality and quantity of the support they received. The successful coordination between the services in Vietnam was not the result of a change in philosophy but was the result of the nature of the war, the large numbers of aircraft in the theater, and high expectation of air superiority in the theater. Service parochialism continued to hamper interservice cooperation outside of Southeast Asia.

The failure of Operation Eagle Claw, the disastrous attempt in April 1980 to rescue hostages held in the American embassy in Tehran, Iran, and lack of coordination among the services during the invasion of Grenada, led Congress to reorganize the Department of Defense with the Goldwater-Nichols Department of Defense Reorganization Act of 1986. Interservice rivalry during Operation Eagle Claw led to the development of an excessively complex plan using the elements of the army, air force, and navy rather than relying on a single service to rescue the hostages. The desire to include the three largest services led to the use of USN RH-53D helicopters incapable of air-to-air refueling rather than USAF HH-3E special operations helicopters, which may have contributed to the failure of the mission.

The goal of the Goldwater-Nichols Act was to strengthen military advice from the military to civilian leaders, provide combatant commanders the authority to achieve their missions, and increase cooperation between the services. The earliest cultural changes resulting from the newly mandated emphasis on jointness occurred in the Joint Chiefs of Staff.

The Goldwater-Nichols Act reorganized the Joint Chiefs of Staff by designating the chairman the principal military adviser to the president and the secretary of defense. While the chairman had to notify the civilian leadership of dissenting opinions from the service chiefs of staff, the effect was to provide unified advice and planning for the Department of Defense. The Goldwater-Nichols Act removed the chiefs from direct operational authority, reorganizing the chain of command so that regional combatant commanders (formerly commanders in chief, CINCs) reported directly to the secretary of defense. This gave the combatant commanders greater authority to plan and conduct operations. Despite these changes, jointness had little effect on service culture for the first 16 years after passage of the Goldwater-Nichols Act. Service parochialism hampered operational planning and effectiveness during Operation Desert Storm (1991) and Operation Anaconda (2002).

Designed to find and capture members of al Qaeda's leadership in the mountainous Shahi Kot valley of eastern Afghanistan, Operation Anaconda required close cooperation between the army, air force, and navy to provide intelligence and close air support for the U.S. Army and its allies in the new Afghan army. Lack of cultural awareness on the part of the commander of the ground forces, Major General Franklin Hagenbeck, and the commanders of the air force and navy leadership diminished the effectiveness of the air support available and the quality of the intelligence gathered. Including the air force and the navy earlier in the planning process likely would have provided more accurate estimates of enemy strength, which at approximately 1,000 men was significantly more than expected.

The flaws in joint planning and operations evident in Operation Anaconda illustrated a need for improvement in joint planning before the invasion of Iraq. Preparation for Operation Iraqi Freedom included the appointment of an air liaison to the land component commander, joint training and

rehearsals for operations, and an emphasis on the air force's dedicated air-ground team. Of all the services, the USAF's culture has changed the most because of jointness since 2002. The realities of fighting the insurgency in Iraq led air force culture to change for Operation Iraqi Freedom as it took on greater infrastructure support, base security, and extensive ground support roles. The unpredictability of insurgent warfare forced airmen to become more familiar with ground combat, develop self-defense skills, and increase their physical fitness.

Of all the services, the USN has lagged the most in embracing cultural changes required by joint operations due to its long history of operating in an environment requiring independent operation. The navy operated jointly only when close to land or supporting amphibious operations. The navy actively worked to defeat the passage of the Goldwater-Nichols Act, and for the next 20 years, the navy continued to favor navy staff and command assignments over professional military education and joint-duty assignments. In 2007, Admiral Mike Mullen, chief of naval operations, argued that the navy needed to strive to change its culture to value jointness.

The 2005 Base Realignment and Closure plan exposes additional conflicts between service cultures under the guise of efficiency and jointness. The law created 12 joint bases, with each service giving up its facilities at those locations to the managing service. The USAF has balked at giving up control of facilities to the army and the navy, which traditionally cut spending on base maintenance and welfare programs when the budget is needed elsewhere. Air force leaders worry that runways and housing needed to fulfill their mission will be neglected at joint bases in Hawaii, Guam, and Washington. The services also worried that joint bases would erode service cultures.

CUSTOMS AND TRADITIONS

Military customs and traditions are an integral part of the armed forces, used to reinforce the institutionalized values instilled through set standards and routines. These customs and traditions have developed over time and differ slightly between branches, units, and training. For the military, customs are established practices, in essence, common law for official behavior both in and out of uniform; traditions are ingrained actions and histories that work to preserve legacy and values of each branch. This entry discusses customs and traditions specific to

and in common with the five branches of the U.S. armed forces.

The scope of customs and traditions can be extremely expansive, including, but not limited to salutes, designated symbols for rank, awards for action, daily procedures, the process for formal events, rules for conduct, and so on. Most of these customs and traditions are deeply rooted in American military history and aim to pay deference to those who fought in previous wars. Each of the branches of the military has a different set of customs and traditions, with various causes, all of which are constitutional to that designated branch, be it army, navy, Marine Corps, air force, or Coast Guard.

In recent years, some customs and traditions have come under public scrutiny in areas of service, including training and formal education at military schools like West Point and The Citadel. The bulk of these controversies stem from the implications customs and traditions have on the gender and sexual orientation of service members. As the military has accepted women and minorities into service, and the country has entered into an era of heightened national security and evolving military strategy, customs and traditions have started to adapt.

Army

As the largest and oldest branch of the U.S. armed forces, the U.S. Army has a host of customs and traditions that date back even before its official founding in 1775. The army uses seven core values as the tenets for duty and action of soldiers, both on and off duty: (1) loyalty, (2) duty, (3) respect, (4) selfless service, (5) honor, (6) integrity, and (7) personal courage (creating the acronym LDRSHIP).

In terms of army customs, these make up the common law and practices carried out by each soldier. Examples include the following: (a) never criticize the army or a leader in public, (b) do not jump the chain of command, and (c) never intentionally avoid giving a hand salute. These customs extend into military courtesies, which involve the finite details of how and when to salute, what salute to offer, and similar customs that showcase respect between ranks. To understand this aspect of army customs, each soldier must learn to identify rank, report to an officer, and react appropriately to an approaching officer or noncommissioned officer, to

passing colors, and to specific national and military music.

Army traditions are twofold; some are designated for all service members, while others are unit or squadron specific like colored berets and official mottoes or mascots. For the army, the servicewide traditions have become incredibly important in the past century, notably with the implementation of the encompassing army flag and streamers in 1956. Army traditions are generally physical symbols, like the morning bugle call and uniform colors, that stand as a testament to the legacy of land-based military operations continually used both during wartime and peace.

Another army tradition is the use of the word *hooah*, a battle cry most often used as a positive response that can follow almost any statement. It is notably cried after completing the Soldier's Creed (see below for text). The term has been translated into similar words and uses in other branches of the military. The "hooah" form is also used by the air force.

The army, like all branches of the military, stresses consistent conduct and model behavior; in the event that a soldier acts outside select customs and traditions, he or she may be subject to punishment. Failure to abide by more stringent army customs and traditions, like recognizing one's superiors or disgracing an army uniform, can lead to disciplinary action or an official censure.

Navy

Similarly, the customs and traditions of the U.S. Navy are deeply rooted in the branch's storied legacy, which also dates back to the mid-1770s. While the navy lacks some of the formal traditions common in other branches, sailors still practice a number of customs related to their posts, uniforms, and naming conventions. The most visually recognizable of these is the traditional sailor dress, always in navy blue and/or white, with varying degrees of accents for more formal uniformed occasions. Additionally, the navy has strict grooming traditions that regulate the length of hair for men and approved styles for women; these standards prohibit any and all body piercings, multicolored hair, and tattoos on the face, neck, and hands.

Many of the formal naval customs are similar to those of the army, mainly involving the salute and

rules surrounding usage. One such custom is the relieving of watch wherein the relieving officer turns to the sailor on watch and says, "I am ready to relieve you, sir" followed by a salute. In response, the other sailor announces, "I am ready to be relieved" and salutes. This exchange is finished up with "I relieve you, sir" with another salute and finally, "I stand relieved." Failure to follow the salute customs will result in individual counsel and the request for an official salute to be completed. Naval customs also dictate the order in which vessels and vehicles are boarded and unboarded by officers, designated by rank and enlisted sailors.

Naval traditions are equally as detailed in execution, particularly in reference to honors, colors, flags, and dressing for the ship. For example, one such naval tradition, still in practice, celebrates George Washington's birthday every February 22, marked by a full dress day for each vessel, displaying a rainbow of signal flags in addition to a 21-gun salute at noon, tolling the bell, a full band, and half-masting the national ensign.

Despite being a smaller presence in current military affairs, the navy has continued to pay rigorous attention to set customs and traditions. Drawing on a deep historical connection, most naval customs and traditions have stayed consistent with little adaptation or evolution needed.

Marine Corps

Like the army and navy, the U.S. Marine Corps was also originally incorporated in 1775 as the Continental Marines. From its initial inception to the present time, the Marine Corps developed a long lineage of customs and traditions, including the celebration of the branch's birthday every November 10. Much like the naval tradition observing Washington's birthday, the marines have marked the date every year since 1921 with a formal ball complete with cake-cutting ceremony. This time-honored tradition also includes the birthday message from the 13th commandant, John A. LeJeune; a birthday message from the current commandant; and the presentation of the first two pieces of cake to the oldest and youngest marines present at the event.

Similar to the other armed forces, the marines use their customs and traditions to reinforce their unique identity compared with the procedural nature of

the army. The most recognizable symbols of this commitment to the corps are the branch's flag, seal, and slogan *Semper Fidelis*, informally shortened to "Semper Fi," or in translation "Always Faithful." The slogan is also the name of the Corps' official march, written in 1889, 6 years after the marines adopted the *Semper Fidelis* slogan.

The Marine Corps also continues the traditional use of nautical terms to describe daily activities, even when onshore. "Gangway" is exclaimed to clear the way for an officer, and marines often say "Aye, aye, sir" to acknowledge verbal orders. To answer a question directly, a marine must respond, "Sir, yes, sir." Additionally, the Marine Corps puts strong emphasis on the proper use of salutes, similar to the other branches of the military.

In comparing the branches, the customs and traditions of the Marine Corps appear to be the most numerous, drawing from a variety of sources both historical and more modern. A prime example of this is Fleet Week in New York City, which began in 1984 for the purpose of paying homage to the efforts of the marines and navy through a series of military demonstrations, parades, lectures, competitions, ceremonies, and related celebrations that invite civilians to witness military life.

Air Force

Primarily composed of pilots, the U.S. Air Force tends to be the most individual-centric of the military branches, reflected in its customs and traditions. The collective U.S. Air Force, as it is known today, was formally established in 1947, making it the newest branch, present in conflicts from the Korean War to the engagements in Iraq and Afghanistan.

In its short history, the air force has instituted a number of slogans and symbols. Additionally, this branch bases its conduct on three core values: (1) integrity first, (2) service before self, and (3) excellence in all we do. In 2007, the air force introduced the Airman's Creed to explain and summarize the branch's culture and ethos, similar to the established creeds of the other, older military branches. The creed consists of four stanzas that spell out the promise of each air force member, defining his or her person and intentions.

The bulk of air force customs and traditions are rooted in proper behavior and etiquette. A number of these spell out the proper use of salutes. This

includes not saluting if your arms are full but instead substituting a verbal greeting; however, it is suggested to always carry items with just the left arm so the right remains free to salute. The air force also stresses the idea that rank has its privileges (abbreviated as RHIP), meant to be an inspiration for all serving members who are to show respect and deference at all times.

In terms of the greater armed forces, the U.S. Air Force customs and traditions are incredibly similar to the army, navy, and marines. There are few distinguishing customs or traditions that set this branch apart; this is most likely the result of the short history associated with the air force, modeled after the older branches and influenced by the branch's unique mission "To fly, fight and win . . . in air, space and cyberspace."

Coast Guard

The Coast Guard got its start in 1790, founded by Alexander Hamilton. Like other armed forces, the Coast Guard functions around a set of core values that include honor, respect, and devotion to duty. The Guard operates under the motto *Semper Paratus* or "Always Ready"; this is also the branch's official musical march. Similarly, the Coast Guard has both an official ethos and a creed. The Guardian Ethos was introduced in 2008; it defines the Guard's mission and contract with the nation. The creed dates back to the mid-1930s and describes the duty of each member.

The Coast Guard offers a number of distinctions and awards, each relating back to the branch's connection to the sea and lengthy history. Officers and enlisted persons with the earliest date of qualification as a cutterman, with a minimum of 10 years of service (it takes 5 years to be deemed a cutterman), earn the honor of the Ancient Mariner. In an official ceremony, the honoree wears a traditional Ancient Mariner outfit complete with gold braided shoulder epaulets while holding a nautical long glass and log book. Similar awards include the Ancient Albatross, a plaque given to the longest serving, active-duty Coast Guard aviator.

Another Coast Guard tradition is the christening of vessels. While this custom is not Coast Guard specific, it has long been associated with the branch and continues in the present times. The christening occurs as a brand new vessel is launched, such as a

ship into the water; at that time, an officer ceremoniously breaks a bottle of champagne over the bow. This tradition dates back to early civilization when christenings would be performed to appease the gods. Today, this commissioning ceremony officially recognizes a vessel in the fleet.

The Coast Guard has a formal tradition known as “Dining In” or “Mess Night.” Again, this event dates way back, historically associated with the Romans and Vikings, who celebrated their victories with banquets. The current Coast Guard version is a formal event that honors the service of officers, respectfully thanking departing officers and welcoming the newly appointed ones. The banquet is a large dinner that dictates wearing evening dress uniforms with medals. The event is as much a ceremony as it is a social function that promotes relationships between serving members. The navy and marines host similar “Mess Night” events. Both “Dining In” and “Mess Night” are military exclusive events; however, there exists “Dining Out” and “Mess Out,” which invites military and civilian guests.

For a large portion of Coast Guard vessels, animals have become a tradition, serving as mascots and companions. There is some evidence that indicates cats were the first Coast Guard pets, brought on board to help control rat populations; however, at some point in time, this practice switched to dogs, though some ships have kept parrots and other animals. These animal mascots often not only serve a purpose aboard a vessel but also provide entertainment and friendship on long voyages.

As far as the armed forces go, the Coast Guard’s customs and traditions differ from the other branches. The deep core values are there, but in practice, the Coast Guard has a few more relaxed customs that enrich the experience without detracting from stringent organizational guidelines and etiquette.

Current State of Customs and Traditions

Given the long history of each branch of the armed forces, most customs and traditions have remained untouched over time. Despite being run by different departments, each branch has a lengthy code that explains and enforces each custom, listing the rules and regulations for salutes, public behavior in and out of uniform, and so on. Individual traditions, specific to a branch, are more open to

evolution, and several of these traditions are in fact, newer, with a number of them created in the 1980s.

Most customs and traditions appear untouched despite specific conflicts and the rapid technological advances of the past century. In fact, it seems that these customs and traditions are intended to continue the history of each branch rather than to change lasting practices. Core values, symbols, flags, slogans, uniform rules, behaviors, and the like are invaluable to both serving and discharged members of each branch. These customs and traditions represent a shared experience, a common bond, and the rigor of service.

Still, over the last half of the 20th century, military customs and traditions came under close consideration in the face of changing civil rights. What had once been a boys’ club that went so far as to segregate races by squad was now desegregated and even allowing female enlistments. The general state of these customs and traditions remained untouched; specific events sparked attention that ultimately forced change.

The Citadel, the Military College of South Carolina, had a tradition of keeping barrack doors lock-free for two reasons: (1) to keep with the sparseness of military life and (2) as a part of the school’s honor code. However, with the introduction of female cadets, this changed over time, and by 2009, not only had The Citadel installed locks on all doors, but it also updated the campus relations guide, *The Blue Book*, to require that doors and gates be locked by lights out following Taps. Without the introduction of female cadets, the lengthy tradition would most likely have continued. Even in light of isolated events, the customs and traditions of the military are still historically rooted and reflect the established core values.

Soldier’s Creed

*I am an American Soldier.
I am a Warrior and a member of a team.
I serve the people of the United States, and
live the Army Values.
I will always place the mission first.
I will never accept defeat.
I will never quit.
I will never leave a fallen comrade.*

*I am disciplined, physically and mentally
tough, trained and proficient in my
warrior tasks and drills.
I always maintain my arms, my equipment
and myself.
I am an expert and I am a professional.
I stand ready to deploy, engage, and
destroy, the enemies of the United States
of America in close combat.
I am a guardian of freedom and the
American way of life.
I am an American Soldier.*

CYBERWAR

Cyberwar is the domain of warfare in which military and paramilitary forces conduct defensive and offensive operations using computer networks. Although military forces around the globe are continually modifying computer systems in an attempt to make them more secure, the computer software running on servers, switches, routers, and other attached computing hardware that make up these networks remains vulnerable to exploitation by skilled computer technicians known as “cyberwarriors.” As militaries around the world have become more dependent on computer networks in land, air, sea, and space domains, they have increasingly focused on cyberwar capabilities. Logistical support running over the civilian Internet is particularly vulnerable, but private networks designed to support

military command, control, communications, and intelligence operations have the same potential vulnerabilities as they run the same basic TCP/IP suite of network protocols. This entry discusses the history of cyberwar, with a focus on cyberwarfare and preparedness in the first decade of the 21st century.

Nonstate actors and emerging powers like India have joined the former Cold War rivals China, Russia, and the United States in a race to develop capabilities and warfighting doctrine as part of a computer network–centric power struggle that has increasingly replaced the nuclear arms race as the primary site of debate over international military technology policy. Two cases of computer network–based attack attributed to Russian cyberwarriors, one in Estonia in 2007 and another in Georgia in 2008, illustrate this shift from conflict scenarios once defined by nuclear balance-of-power concepts like mutually assured destruction to scenarios defined by computer security. The Estonian and Georgian cases featured distributed denial of service attacks and website defacements.

Historical Roots of Cyberwar

Cyberwar has historical roots in both the history of military intelligence and the history of computing. The ability to know the capabilities and intentions of one’s adversaries, or military intelligence, and exploit that knowledge to gain battlefield dominance has long been part of the operational art of warfare. Cyberwar’s roots stretch back at least as far as the development of military telegraphy and the operational use of encrypted communications over the telegraphic network, a network Tom Standage has called the Victorian Internet.

During the American Civil War, Confederate and Union forces used wigwag signaling (a combination of flags, Morse Code, and hand signs) to communicate command, control, and intelligence information to and among forces in the field. At the suggestion of Albert Myer, the inventor of this form of signaling, wigwag was used to feed Southern commanders inaccurate information via unencrypted messages sent by Northern forces. Using this communications network–based deception technique, Union commanders were successful in their attempts in the spring of 1863 to distract J. E. B. Stuart’s Cavalry and thereby created an opening in Confederate lines that was exploited by Union forces.

In the two World Wars of the 20th century, the United States and European nations attempted to make strategic use of encryption and decryption techniques to protect their own communications and to read adversaries' secret message traffic. Revelations of German intentions in Mexico made possible by decryption of the Arthur Zimmerman telegram helped Woodrow Wilson build a case for America's first entry into a war on the European continent in the spring of 1917. In the Second World War, the Ultra (British) and Magic (U.S.) code-breaking efforts provided intelligence information that allowed British and American forces to know German and Japanese plans. These code-breaking efforts in England and America during the Second World War laid a foundation of people and technologies on which military computing would build in the aftermath of the Second World War.

Cyberwar Is Coming! (1989–2009)

By the end of the Cold War, computing capabilities had not only reached the desktop but also become embedded in weapons systems. During the Persian Gulf War of 1990–1991, the U.S.-led military coalition strategically attacked antiaircraft defense systems to allow for the successful bombing of Baghdad in preparation for Operation Desert Storm. Smart bombs controlled by computer guidance systems reached their targets with devastating effect. On the battlefield, the use of the Global Positioning System allowed the coalition forces to navigate through miles of Saudi desert to deliver the “left hook” to the Iraqi Republican Guard forces in Operation Desert Storm.

Following the Persian Gulf War of 1990–1991, the military forces of the former Cold War rivals continued their process of reorienting warfighting doctrine and realignment of forces in the new post-Cold War world. During this period, analysts at the RAND Corporation in California began to talk metaphorically about networks of warfare in which the collection, processing, and application of information would afford strategic advantage to the U.S. military. Thinking of the “left hook” in Iraq in the context of the Internet's broader use in information warfare, two analysts at RAND named John Arquilla and David Ronfeldt wrote papers on cyberwarfare to include Zapatistas in Mexico, international organized crime in Russia, and militant environmentalists in Seattle.

A particularly vexing problem for cyberwar planning has been the increasing dependency of military

operations on civilian information technology (IT) infrastructure for transportation, telecommunications, power, health care, and financial networks. From the supervisory control and data acquisition systems that control power grids to the electronic health record systems used in hospitals, increasingly military operational planning under the aegis of cyberwar preparedness has expanded to include the civilian IT infrastructure. During the 1990s, cyberwarfare preparedness came to be associated in the United States with the revolution in military affairs, which promised a more cost-effective approach to warfighting and focused agency efforts on IT systems as core elements of warfighting strategies. Defense agencies extended the concept of information warfare to include concepts of network-centric warfare, as civilian and military planners engaged in “day-after” exercises in the 1990s that included penetration tests directed at IT systems. Among the most highly visible of these exercises occurred in June 1997 and was called Operation Eligible Receiver. During this exercise, the National Security Agency Red Team simulated attacks on government IT systems and on commercial IT infrastructure as well. U.S. Atlantic Command then conducted a follow-up exercise called Evident Surprise to explore cyber vulnerabilities in the Department of Defense systems, including simulating an attack on the electronic health record systems that track blood supplies to identify and then remediate vulnerabilities in those systems.

In the aftermath of the attacks on the World Trade Center and the Pentagon on September 11, 2001, the U.S. president George W. Bush declared a Global War on Terrorism, and the U.S. government reorganized defense agencies into the new Department of Homeland Security. Fears of al Qaeda use of the Internet led to the passage of the USA PATRIOT Act in the immediate aftermath of the attacks, which granted the government wide-ranging authority to conduct searches on domestic computer networks in an effort to fight international terrorist networks. A reorganized U.S. intelligence community, attempting to respond to the lessons learned from intelligence failures in the lead-up to the 9/11 attacks, grew at rapid rates in the first decade of the 21st century in a manner that critics pointed out lacked a grand strategy unified military command structure for cyberwarfare.

Widely reported attacks on U.S. assets at the start of the 21st century were thought by the U.S. intelligence community to have emanated from the former Cold War rivals Russia (1998–2000, Moonlight Maze) and

China (2003–2005, Titan Rain). In both cases, the cyber attacks had been going on for months before they were detected. In 2006, Russian hackers and scientists operated in the Middle East during the Israeli war with Hezbollah. Israel then used cyberwarfare to provide cover for an air strike against Syria the following year. Also, in 2007, attacks originated from Russia on the Estonian government after that government removed a Russian statue. In the summer of 2008, Russian forces used cyber attacks in support of their invasion of Georgia. Each of these incidents featured denial of services against nonmilitary targets. More recently in late 2010 and into early 2011, attacks on Google and other companies originating in China caused Google to rethink its market development strategy in that country. As these attacks show, cyberwarfare blurs the line

between traditional definitions of war and peace. It also blurs the lines between criminal acts and acts of war, while it further erodes the traditional boundaries between military and civilian targets.

Formation of U.S. Cyber Command (2009–)

In June 2009, the U.S. secretary of defense Robert Gates announced the formation of U.S. Cyber Command, inaugurating a new joint forces structure for waging cyberwar that would provide the Obama administration a basis for coordination among U.S. Army, Air Force, Navy, and Marine cyber commands formed in the 1990s and early 2000s. Appointing the four-star general Keith Alexander as its first commander, Secretary Gates reinforced the linkage to intelligence capabilities that dominance in the cyber

U.S. sailors assigned to Navy Cyber Defense Operations Command man their stations at Joint Expeditionary Base Little Creek-Fort Story, Virginia, August 4, 2010. Navy Cyber Defense Operations Command sailors monitor, analyze, detect, and respond to unauthorized activity within U.S. Navy information systems and computer networks.

domain requires of modern militaries. A career army intelligence officer, Alexander continued to serve as director of the National Security Agency after assuming command of Cyber Command. Congressional debates over Alexander's nomination and the caution that marked his public statements on the capabilities and mission of his new command highlighted persistent American concerns over the possibility that cyberwar intelligence-gathering capabilities could be turned on American citizens. Secretary Gates and Alexander have focused on the role this new command is to play in protecting the Department of Defense's computer systems and in preparing for offensive operations.

DECORATIONS AND MEDALS

Decorations and medals are the two broad categories of award recognition given to military members for valorous acts, achievement, and service. Both are symbolic in nature and intended to reinforce desired behavior through public recognition. A decoration is awarded to an individual for a heroic act during a military conflict or engagement. A medal is awarded to individuals or units for achievement or service, both during war and peacetime. Decorations and medals physically consist of a medallion suspended beneath a ribbon. Each has a distinctive design and color pattern and is worn on the dress uniform during parades or formal events. Both are presented in public, usually by the level of command corresponding to the place of precedence of the award. The Department of Defense uses the American Pyramid of Honor to set out the precedence of its top decorations and medals. The Medal of Honor is the highest award that can be bestowed on a member of the U.S. military. This entry describes the historical background and development of decorations and medals in the U.S. military.

Background to U.S. Decorations and Medals

The tradition of bestowing decorations and medals in the United States was rooted in its colonial connection to Britain. The British system in turn was rooted in medieval notions of chivalry and awarded decorations only to officers, symbolic of their entrenched social stratification. Unencumbered

by that strict social system, the American military was the first to award decorations to enlisted men. George Washington authorized the Badge of Military Merit, which after a period of disuse later became the Purple Heart. Few of these were actually awarded, but the precedent was set.

The next period of award usage in the American military was during the Mexican-American War when the U.S. Army authorized the use of the Certificate of Merit. The certificate did not include a decoration or a medal, however, until 1905. The Certificate of Merit Medal became obsolete in 1918, but awardees could exchange it for the Distinguished Service Medal. In 1934, all of these awards were upgraded to the Distinguished Service Cross.

The Medal of Honor debuted on December 21, 1861, when President Abraham Lincoln signed a bill initiated by the secretary of the navy, Gideon Wells, that authorized the decoration to promote efficiency in the navy. The wording of the bill also established acts of gallantry as criteria for the award. The army quickly followed suit and designed a Medal of Honor of its own and borrowed the criteria language from the navy. The problem of subjectivity in defining whether or not an action met the award criteria was immediately clear. Some medals were awarded by mistake, and men could even apply for the award themselves after the war was over.

In 1890, a group of Medal of Honor awardees formed the Medal of Honor Legion and agitated for a top-down review of the award criteria to prevent gratuitous or politically motivated awards. As a result, the army issued the first order that distinguished between acts of bravery and acts of superior

service. The Medal of Honor was for bravery and the Certificate of Merit was for service. Furthermore, the order established that the medal was appropriate to recognize valor even in defeat.

The practice of issuing medals to whole units began during the Spanish-American War in 1898. Naval and Marine Corps enlisted and officers received a medal for battle participation, but those who were not in battle were eligible for a separate service medal. The army caught up in 1905 when President Theodore Roosevelt authorized campaign medals for all past or future campaigns. In the same year, Roosevelt issued an Executive Order that established the precedent of a formal public ceremony for presentation of the Medal of Honor. This enhanced the medal's prestige, but little else was done until 1916 when the United States began preparation for possible entrance into World War I. An investigation board was established as part of a larger national defense act with instructions to identify Medal of Honor awards that did not involve combat. As a result of the board's work, 911 medals were rescinded. This was the first step in establishing the sanctity of the Medal of Honor.

Modern Military Decorations and Medals

In 1918, Congress established clearer criteria for the Medal of Honor that included acts of conspicuous gallantry beyond the call of duty. To alleviate the subjectivity inherent in defining what constituted "conspicuous gallantry" and what it meant exactly to go "beyond the call of duty," Congress substituted the Distinguished Service Cross for the Certificate of Merit and established the Citation Star, which in 1932 became the Silver Star. These two new decorations allowed commanders to recognize valorous acts that did not meet the more rigid standards of the Medal of Honor. The establishment of these decorations also served to heighten the distinction of the Medal of Honor as it now sat firmly atop the Pyramid of Honor.

The distinction between awards for heroism and awards for service was also reaffirmed. In addition to the Medal of Honor, the Distinguished Service Cross, and the Silver Star, in 1919 the services began awarding the Distinguished Service Medal. The year 1926 witnessed the addition of the Distinguished Flying Cross for heroism or achievement, and in the same year, the army added the Soldier's Medal for

William J. Donovan's Medal of Honor. He was awarded the medal for action in France in 1918. Donovan led his men to take the German position. He was eventually wounded in the leg but refused to be evacuated from the battlefield until his men and the position were secure. General Donovan was the most decorated officer of World War I.

noncombat heroism. George Washington's original design for the Badge of Military Merit served as the basis for the 1932 Purple Heart awarded to men who received wounds from the enemy during conflict.

In World War II, the United States committed to total war. The sheer number of men involved in combat in both the Pacific and the European theaters necessarily meant that the number of

recommendations for awards would be larger than for any previous conflict. With a functioning award system in place, the U.S. military added several new awards to capture acts of heroism, valor, and distinguished service. The new awards ranked at different levels of the precedence scale, which empowered lower levels of command with award authority. This had the added benefit of reduced administrative strain on higher headquarters. Service regulations established the award authority and administrative routing process for each decoration and medal to facilitate administrative speed and reduce the time between the recommendation and receipt of the award.

The highest of these new awards was the Legion of Merit, established in 1942 and awarded for distinguished service. In the same year, the U.S. Navy and the Marine Corps added a medal equivalent to the U.S. Army's Soldier's Medal for noncombat heroism. Also in 1942, the Air Medal was added by all services for valor or meritorious achievement. This award recognized flight crews or individuals who participated regularly in flight missions. The Bronze Star Medal was created 2 years later to recognize valor or meritorious service. Meritorious achievement was recognized by the navy and the Marine Corps in 1944 and by the army in 1945, with the creation of the Navy and Army Commendation Medals, respectively.

The sanctity of the Medal of Honor as the highest decoration for valor was firmly established during World War II, in part because of the various subordinate awards outlined above, but mostly because more Medals of Honor were awarded posthumously than to living recipients. Edward Murphy points out in *Korean War Heroes* that of the 433 awarded only 190 recipients survived their exploits. This established a trend that continued through the Vietnam War. Updating Murphy's numbers with information from the Medal of Honor Society's website shows that during the Korean War only 37 of 132 men who received the medal were living recipients. In the Vietnam War, 151 of 242 medals were awarded posthumously. Several new awards were added to the Pyramid of Honor between 1969 and 1986, but by this point, the sobering statistics of Medal of Honor awards from World War II, Korea, and Vietnam overshadowed any additional effect that expansion of the pyramid would have in adding to the prestige of the Medal of Honor.

Since the 1990s, only eight Medals of Honor have been awarded, all of them posthumously. Two were awarded for actions taken during the 1993 "Black Hawk Down" incident in Somalia when a mission to capture a Somali warlord resulted in 18 American deaths. During the Global War on Terrorism, two Medals of Honor have been awarded in Afghanistan and four in Iraq. The relative lack of Medal of Honor awards was perceived as a consequence of the changed nature of fighting low-intensity conflicts that have had few sustained actions comparable in scale to the battles of World War II, Korea, or Vietnam. The issue prompted a House of Representatives Military Personnel Subcommittee of the Committee on Armed Services hearing in December 2006. Committee members were concerned that an unwritten criterion was established in the minds of military commanders that the recipient had to have lost his or her life in order to qualify for the Medal of Honor. Most of those who testified recommended a thorough review of lower awards during the Global War on Terrorism with the intent of upgrading some to the Medal of Honor. This would in effect be a complete reversal of the 1916 review board.

The subordinate decorations and medals have experienced a negative correlation in terms of public awareness with the ascension of the Medal of Honor. The downward trend in publicity concerning these lower awards began in Korea. The Medal of Honor was publicized in the Korean War to help sell the war effort and thus received heightened attention, but Distinguished Service Crosses and Silver Stars still received press attention. With the unpopular Vietnam War, coverage of awards in general dropped off. Today, it is unlikely to read about a lesser award in anything other than a military publication or the recipient's hometown newspaper.

Decorations and medals, however, remain very important within the military. The issue of subjectivity in determining whether or not an action meets established criteria remains a contentious issue among, and between, officers and enlisted personnel. The essential structure established in 1918 and expanded up to 1986 remains the same. One change reflecting the expanded bureaucratic nature of a large standing military has been the addition at all levels of commands of the "awards board" to study each case, scrutinize it against established criteria, and recommend approval or disapproval to the unit

commander. This process is repeated at each level of command until it reaches the appropriate approval authority. Today, military members are eligible for decorations, service awards, unit awards, campaign ribbons, skill badges, and foreign awards. Each symbolizes an important event in the life of a military member that transcends the physical award and reinforces military culture.

DEFENSE, DEPARTMENT OF

The Department of Defense (DOD) is headquartered in the Pentagon in Arlington, Virginia. The department comptroller estimated the budget of the

DOD for 2011 to be \$708 billion, with \$159 billion included for overseas contingency operations; the base budget of the DOD is approximately 3.5% of the U.S. gross domestic product. The organization, the largest in the Executive Branch, is responsible to the president of the United States for the military forces needed to deter war and to protect the security of the United States. This mission began shortly after the American War for Independence, in 1789, under the supervision of an organization called the War Department, joined in 1798 by the Navy Department. This entry discusses the history of the U.S. DOD from its creation after World War II to the present.

Throughout the 19th century, the army and navy competed for the primary role in planning the nation's strategic defense. Because of U.S. geography and political neighbors, the navy assumed a leading role as the nation's first line of defense and arm of force projection. The two services continued to compete for status, and the resources that accompanied that status, well into the 20th century through two World Wars and the emergence of the United States as a global power.

Post-World War II Unification of the Armed Services

In 1945, President Harry Truman proposed, to a special session of Congress, the unification of the nation's armed services under one organization. This plan, developed by the War Department, placed the service departments—to include the U.S. Air Force, to that point the Army Air Forces—under a uniformed head supervised by a civilian department secretary. Unifying the services under one secretary of defense would both quash at least public interservice competition as well as place the weight of the military behind one voice in considerations of strategy and resources. After 2 years of debate and conflict, and despite the protests of Secretary James Forrestal and the Navy Department, the National Security Act of 1947 created the National Military Establishment (NME). Congress confirmed James Forrestal as the first secretary of defense on September 17, 1947.

The NME consolidated the three service departments: (1) the Department of the Army, (2) the Department of the Navy, and (3) newly independent the Department of the Air Force. A cabinet-level

secretary headed each department; however, the relationship between these secretaries and the new secretary of defense was unclear. The secretary of defense had an ambiguous relationship with the Joint Chiefs of Staff and the chairman, who retained their roles as the uniformed heads of the military. By failing to define the relationships, roles, and responsibilities of the varied services and the secretary of defense clearly, the National Security Act of 1947 failed to end the conflict within the American military establishment.

Competition between the services boiled over in 1949. After Secretary Forrestal denied them the budget they requested, the secretary of the air force and the air force chief of staff brought their grievance to the Senate Armed Services Committee. Under Forrestal, they contended, the NME continued to favor a plan that prioritized the naval budget before the other services. Each service claimed that its advancement, be it super carriers for the navy or increased authorizations within the air force's bomber wings, was essential for the security of the nation. Each expensive request ran counter to the will of President Truman's administration, which desired to cut costs after the war. In this scenario, James Forrestal resigned on March 2, 1949.

Expanded Authority: The Department of Defense

On Forrestal's resignation, Congress confirmed Louis Johnson as the second secretary of defense. Congress amended the National Security Act of 1947, making several changes beginning August 10, 1949. Among these, it renamed the National Military Establishment, calling it the DOD, and so losing the unfortunate acronym "NME." Furthermore, the amendments granted the secretary of defense greater authority over the services and reduced the service secretaries from cabinet-level positions to department heads within the DOD. With more authority, the secretary of defense gained greater control and staff; Congress authorized funding for a deputy secretary of defense and three assistant secretaries, one of whom, as comptroller of the DOD, held primary responsibility for the department's budget.

This expanded power strengthened Johnson's role in the conflict between the air force and the navy. On April 23, 1949, he cancelled the super carrier funded under Forrestal—a ship on which construction had begun—and shifted that funding to the

air force. Johnson moved national strategic policy firmly away from the navy toward the air force, acting on his belief that the navy's, and the Marine Corps's, utility was waning. Navy officers reacted to his actions and attitudes with what became known as the "revolt of the admirals."

These admirals watched the DOD stripping the offensive power of the navy and gifting it to the air force—a loss that, in their eyes, damaged the nation. They marshaled a political attack on Johnson and W. Stuart Symington, secretary of the air force, raising accusations of corruption and malfeasance and attacking the abilities of the air force's newest strategic platform, the Convair B-36. Hearings before the House Committee on Armed Services drew attention to the failings of particular technologies integral to the air force strategy. The outcry forced the debate on fundamental issues of strategy, made more relevant by the first Russian atomic detonation in September 1949. Subsequently the secretary of defense and the DOD played a key role in developing the strategy of massive retaliation first enunciated in 1954.

NSC-68 (a 1950 top-secret report from the U.S. Department of State's Policy Planning Staff) expanded the Cold War from Europe to the rest of the globe; the State Department initiated the study of U.S. strategic policy and military programs and presented it to Truman on April 7, 1950, after his request on January 31, 1950—primarily in response to the Russian nuclear explosion. Committee members doubted that the defense budget of \$13.8 billion agreed on by Truman and Johnson could meet the needs of American security. The outbreak of war on the Korean Peninsula—the first proxy conflict of the Cold War—lent their doubts validity and began the growth of the American national defense budget.

A Strategic Reorientation: 1960s

The eighth secretary of defense, Robert McNamara, also attempted to diminish the DOD's budget. Serving under Presidents John F. Kennedy and Lyndon Johnson from 1961 to 1968, McNamara drew on business principles to implement systems analysis for public policy within the defense bureaucracy. To create this change, McNamara centralized more power in the Office of the Secretary of Defense, creating the civilian Defense Intelligence Agency, the Defense Communications Agency, and the Defense

Supply Agency in 1961. These agencies took control of their fields from uniformed service members, giving the secretary of defense greater control, particularly in supply procurement, distribution, and inventory management.

Under McNamara, the DOD instituted the Planning, Programming, and Budgeting System to analyze defense requirements in order to plan a long-term budget. Combining this process with greater control over defense resourcing enabled by the Defense Supply Agency assisted the secretary of defense in reducing costs, in part by consolidating programs. The results balanced the successful consolidation of the F4 Phantom and A-7 combat aircraft against the failure of the TFX dual-service aircraft and the troubled beginning of the M-16 rifle. During this time, the DOD began, ended, and consolidated programs with little regard for the protests of senior officers. The Joint Chiefs of Staff came to believe that McNamara and his staff could manipulate the mountains of data produced to support the Planning, Programming, and Budgeting System in order to rationalize decisions already made by the Office of the Secretary of Defense.

During McNamara's tenure and at President Kennedy's initiation, the DOD moved away from the strategy of massive retaliation to one of flexible response. The new strategy required the nation's military to develop more options in the area of limited warfare. Because the Cold War against the Soviet Union and the spread of communism remained the preeminent threat to national security, this change in strategy meant emphasizing counter guerrilla warfare and developing the ability to teach counter guerrilla techniques to allies faced with communist revolutions. Along with this strategic reorientation, McNamara supported the domino theory for engaging U.S. troops in Vietnam. His orientation toward systems analysis and budgetary management led him to determine that a war of attrition could successfully eliminate the limited number of fighting men available to the Viet Cong in that theater and so measure success by the metric of the body count. McNamara grew increasingly disillusioned by the war in Vietnam until he left the position on February 29, 1968.

Effects of the 1986 Goldwater-Nichols Act

Alarmed by American military failures in the 1960s and 1970s—a list dominated by Vietnam—Senators

Barry Goldwater and Sam Nunn authored the Goldwater-Nichols Act of 1986. Despite a steady growth of the secretary of defense's power since 1949, the bureaucracy of the DOD remained tangled, with an unclear chain of command and disputed jurisdictions that enabled bureaucrats and uniformed officers to establish jealously guarded fiefdoms within the organization. Goldwater-Nichols expressly granted total authority within the DOD, and over all activities of the DOD, to the secretary of defense. The act specified that the military chain of command ran from the president through the secretary of defense to the unified combatant commanders, explicitly removing the Joint Chiefs of Staff, including the chairman, from that chain of command. The unified combatant commanders gained greater power and autonomy, to include explicit authority over the elements from other services within their joint commands, an issue fought by the army, navy, air force, and even Coast Guard. Goldwater-Nichols finally delineated the subordinate relationship of the service secretaries to the secretary of defense. Over the opposition of the Joint Chiefs of Staff and their supporters in Congress, the senators pushed the legislation through; President Ronald Reagan signed the act into law on October 1, 1986.

After the reforms of the Goldwater-Nichols Act, the DOD experienced a period of great success, to include Operations Desert Storm and Desert Shield in the Persian Gulf. The department experienced such success that, in 2001, Secretary of Defense Donald Rumsfeld could legitimately criticize the organization for complacently ignoring the need to change; the DOD suffered from too much success. On his appointment as secretary of defense, Rumsfeld began a project of transformation in the services, particularly the army, intent on reshaping the military to be lighter, more responsive, and more mobile.

The Department of Defense Today

The attacks on the United States on September 11, 2001, aided Rumsfeld's and the DOD's efforts to reshape the military. The secretary of defense, particularly, seized on problems of cross-government cooperation and information sharing, offering solutions that drew more power within the DOD and the Office of the Secretary of Defense. The success of the short military campaign to seize Baghdad

in 2003 lent validity to these increases in power, but the lengthening occupations and insurgent struggles in both Iraq and Afghanistan tarnished that validity. In early 2006, eight retired generals and admirals called for Rumsfeld's resignation in an unprecedented demonstration of uniformed service members' discontent with their civilian leadership. On November 1, 2006, President George W. Bush announced that Secretary Rumsfeld enjoyed his full support, yet the DOD announced Rumsfeld's resignation on November 8, making him the second longest serving secretary of defense after McNamara.

Robert Gates, sworn in December 5, 2008, to replace Rumsfeld, oversaw the troop surge credited with stabilizing the struggle in Iraq and reformed the veteran's health system after the scandal of neglect exposed at Walter Reed Medical Center. During his tenure, the DOD began another cycle of periodic budgetary reform, cutting many projects oriented toward a conventional struggle deemed unlikely by strategists and politicians. President Barack Obama replaced Secretary Gates in 2011 with Leon Panetta, previously head of the Central Intelligence Agency, who was expected to continue the budgetary reform Gates instituted. The administration is reported to expect DOD to cut as much as \$178 billion from its budget between 2012 and 2016, including dramatic cuts to the projected budgets for combat operations. In February 2013, former Nebraska senator Chuck Hagel replaced Panetta as Secretary of Defense.

The combatant commands within the DOD in 2010–2011 included the following:

- Northern Command (NORTHCOM)
- Central Command (CENTCOM)
- European Command (EUCOM)
- Pacific Command (PACOM)
- Southern Command (SOUTHCOM)
- Africa Command (AFRICOM)
- Special Operations Command (SOCOM)
- Strategic Command (STRATCOM)
- Transportation Command (TRANSCOM)
- Joint Forces Command (JFCOM)

Part of the budgetary reform of the DOD under Gates includes closing Joint Forces Command. To face the changing electronic threats of the 21st century, the

DOD established a new major command, Cyber Command, which became fully operational in 2010.

DEFENSE, SECRETARY OF

Since the end of the Second World War, the president appoints one person—a civilian retired from military service for at least 7 years—to advise the president on matters of national security and to direct the Department of Defense. Sitting on the president's cabinet and National Security Council, the secretary of defense is a position of immense national influence and international significance. This entry describes the responsibilities of the secretary of defense, examines influential secretaries of defense in U.S. history, and concludes with an assessment of the position's challenges in the 21st century.

Primary Responsibilities

Directed by the commander in chief, the secretary of defense (frequently abbreviated to SecDef in military communications) oversees the chairman of the Joint Chiefs of Staff, all military departments, and the Department of Defense. The position is sixth in the presidential line of succession. Congress allocated a salary of \$191,300 as of 2011 for the presidential appointee, who is approved by the Senate. In 2010, the SecDef controlled a \$725 billion budget

that added up to more than \$1.1 trillion in spending after military-related costs were added. Additionally, the SecDef must help coordinate the president's foreign and domestic policies, especially regarding matters of national security, but also relating to matters of energy, emergency management, immigration, and trade. As one of the most recognizable faces of the military—especially since the 1960s—the SecDef must address the media on issues of national security. (See the section on Robert S. McNamara below for more on the public profile of the SecDef.) Infrequently, the secretary will visit troops in war zones to boost troop morale and convey a first-person connection to wars that the secretary directs from the Pentagon. The SecDef must lead the effort to procure all equipment necessary to the military and maintain a catalog. In this effort, the secretary must strive to secure contracts that will allow the armed forces to thrive now and in the future. Along with these more mundane responsibilities of budget and procurement, the secretary sits in a prominent position on the National Security Council that was founded with the same act of Congress in 1947.

History

The position descends from a heritage going back to Henry Knox, who served President George Washington in the first cabinet as secretary of war. The secretary of the navy became a cabinet position under John Adams, when the United States faced increasing threats at sea. During the Second World War, the various military departments frequently found themselves at odds in planning and carrying out strategies, especially in the Pacific theater. The postwar effort to unify planning resulted in the SecDef as the chief military advisor to the president. The National Security Act of 1947 created the National Military Establishment, dissolved the office of the secretary of war, and created secretary posts for the army, navy, and air force, none of which would sit on the president's cabinet thereafter. Initially, the new powers of the SecDef seemed unclear, but the National Security Council renamed the National Military Establishment the Department of Defense in 1949. In the resulting organizational chart, the SecDef assumed immense responsibilities in coordination with the president's policy, including serving as part of the National Command Authority, which paired the SecDef with the president to command dually all nuclear weapons.

The most influential secretaries have shaped and reshaped the position, overseeing a tremendous expansion of the military-industrial complex, influencing the conduct of the United States in the Cold War, planning and implementing military moves around the world, and advising presidents. Among the 24 men who have held the position since its formation in 1947, several stand out for their contributions to the position.

President Harry S. Truman appointed the first four secretaries of defense. While many secretaries have carried a lower profile, the first SecDef, James Forrestal, forged the position as an advocate of keeping the military well funded and prepared, resisting Truman's publicly stated wishes to pare down the military and its budget after the Second World War. Forrestal is credited with the effort to integrate the military and initiate the unification of military policies. Truman replaced Forrestal with Louis Johnson, who carried out Truman's plan to minimize the military. The overall result meant that secretaries would be chosen primarily to carry out the president's plan—frequently in the face of opposition from active armed forces. Johnson's emphasis on consolidating the armed forces and reducing the defense budget put him in opposition to people arguing for military preparedness, especially in the wake of Soviet nuclear tests, which Johnson chose to deny. The episode of tension between the SecDef and military leaders became known as the “revolt of the admirals.” Truman replaced Johnson with his former secretary of state, George Marshall, who was in the midst of working for the Red Cross. In only 1 year, Marshall successfully argued for selective service and the dismissal of General Douglas MacArthur. For this action, Senator Joseph McCarthy accused him of being pro-communist. Despite this, Marshall soon earned the Nobel Peace Prize for his work in stabilizing Europe after the Second World War. His successor, Robert Lovett, became known as the chief architect of America's Cold War containment plan and one of America's “Wise Men.”

President Dwight D. Eisenhower lured away the president and CEO of General Motors, Charles Erwin Wilson, to be SecDef and implement the military's New Look, which emphasized nuclear weapons and an air force able to deliver such weapons. The plan called for a smaller army, which met with resistance. As the point person in outpacing the Soviet Union in nuclear weapons for

the diplomatic strategy of brinksmanship, Wilson found himself plotting the Cold War. For his second term, Eisenhower appointed the first SecDef without any military service record, Neil McElroy, who had been president of Procter & Gamble. McElroy's tenure became devoted to media inquiries about the "Missile Gap," which were closely linked to the Soviet Union's launch of the satellite *Sputnik*. One year after the Soviets gained the upper hand in space, McElroy helped secure legislation reorganizing the military to fund more technological research. Eisenhower promoted Thomas Gates from secretary of the navy for the final 14 months of his term. Due to his experience in the Department of Defense, Gates could take credit for a dramatic increase in the missile defense system as well as growth in nuclear-powered aircraft carriers and the B-52 bomber. Gates spent much of his time addressing conflicting reports of the missile gap between the United States and the Soviet Union, so he proposed the Defense Intelligence Agency, designed to minimize interservice rivalries and criss-crossing jurisdictions and to provide intelligence to a centralized command. The Defense Intelligence Agency was supposed to provide a unified source of information reporting to the Joint Chiefs of Staff and finally to SecDef and began with John F. Kennedy's administration.

In many ways, Kennedy appointed the most controversial SecDef, Robert S. McNamara, who spearheaded the country's strategy to defeat or at least contain communism, especially in places like Cuba and Vietnam. McNamara became associated with the dramatic escalation of the Vietnam War and led the effort to provide the public with optimistic portraits of American chances for victory. McNamara's actions magnified the position in the public eye, especially in the way he represented the Johnson administration before the media, which led subsequent secretaries to seek a more subdued public profile. Leaving his mark on every aspect of the position, he revised budgeting to make the military more cost-effective and restructured significant elements of the military. He supported the Nuclear Test Ban Treaty in 1963, while increasing the American ability in "second-strike" ability. He devised the "flexible-response" approach of military readiness, which led to increased numbers of active-duty service members prepared for counterinsurgencies against guerrilla warfare. Budgets rose significantly during his tenure even before the Tonkin Gulf

Resolution. His personal reservations about U.S. success in Vietnam contrasted with his public advocacy of invasion and escalation. He opposed air attacks and provided a pessimistic counterpoint to military leaders but continued to support the Johnson administration's positive perspective on the war in public. He resigned just before 1968 and the Tet Offensive that seemed to confirm his reported suspicions about the potential for American victory in Vietnam. Decades later, he published books and exposed his mistakes in an Academy Award-winning documentary ("The Fog of War") that revisited his decisions as SecDef, providing rare admissions of mistaken judgment in power, while simultaneously vindicating some of his actions. McNamara served longer than any other SecDef.

Appointed by Richard M. Nixon, Melvin Laird served as the bureaucratic servant of the president and Henry Kissinger, the national security advisor. Laird tried to improve morale in the Department of Defense, diminish use of drugs, and stop racism. He supported "Vietnamization" as the U.S. plan for the Vietnam War, led the effort to remove U.S. troops from Vietnam, and tried to get allies to share the burden of fighting communism. At the beginning of his second term, Nixon appointed James Schlesinger to complete the removal of troops from Vietnam and deactivate conscription. As SecDef, Schlesinger took his place in a lengthening line of secretaries who faced the challenge of maintaining military strength in the midst of postwar budget cuts and declining public support for the military in general.

The defense budget declined until 1979, when revolution in Iran and the Soviet invasion of Afghanistan provoked concerns for SecDef Harold Brown, whose main legacy under President Jimmy Carter had been his efforts to support the Camp David Accords and SALT II.

Under President Ronald Reagan, Caspar Weinberger helped design the arms race designed to end the Cold War by bankrupting the Soviet Union. Helping Reagan imagine a system of defense from above the earth (Strategic Defense Initiative), Weinberger guided a vast peacetime expansion of the military.

Robert M. Gates made history for being the first secretary to serve presidents of both parties. Appointed in 2006 on the resignation of Donald Rumsfeld, Gates's tenure will be remembered for significant shifts in policy such as the reorganization of

the Pentagon's budget to focus less on missile defense and more on current wars, a more aggressive attack strategy in Iraq and Afghanistan including surges in troops deployed, and the end of "Don't Ask, Don't Tell." Rumsfeld, who held the position under Gerald R. Ford and George W. Bush, led defense efforts after the terrorist attacks of September 11, 2001. Arguing for new weapons systems like the Strategic Defense Initiative, he emphasized futuristic armament. He argued for quick strikes against al Qaeda, the Taliban, and Iraq, designed to limit the commitment of occupying forces. Among the achievements of the post-Soviet era, various secretaries can claim success in expanding the North Atlantic Treaty Organization to include nations that were once part of the Warsaw Pact and well beyond the strict limits of the North Atlantic.

Challenges in the 21st Century

SecDef Chuck Hagel and future secretaries must balance the increase in allies against new threats to the United States. Hagel began his work in March 2013, avoiding a suicide bomber's attack in Afghanistan while indiscriminate sequestration cuts threatened his budget. Indeed, the SecDef faces significant obstacles in leading the nation's defense in the 21st century. Cyber attacks may pose the biggest threat to the United States. The multiplicity of opponents and decentralized terrorist networks around the world complicate the demands of defense, especially when these adversaries may not be connected officially to governments with whom the United States negotiates. As the United States struggles to find ways to balance fiscal budgets and to reduce the federal deficit, appointees must nonetheless ensure national security in an increasingly hostile world. Defending America overseas without great expense of life or money will continue to be difficult. The secretary will continue to forge a policy that may favor the use of drones for their ability to strike at elusive enemies without immediate loss to American life, while knowing that the use of drones may be beyond the shrinking budget and antagonize American enemies. The secretary must help the president and secretary of state confront the fallout from leaks of highly sensitive documents, which threaten to destabilize relations with even the most vouchsafed allies of the United States. Such disruptions to American alliances undermine the secretary's ability to build coalitions

to bear the financial and military burdens of a global defense network for the United States.

DEFENSE INTELLIGENCE AGENCY

The Defense Intelligence Agency (DIA) coordinates all-source intelligence activities for the secretary of defense, Joint Chiefs of Staff, and military commanders as well as the intelligence community. Considered to be the head of military intelligence, the DIA coordinates intelligence communities within the U.S. Navy, Marine Corps, Army, and Air Force. The DIA employs both military and civilian personnel and places an emphasis on military intelligence sharing. This entry describes the background and creation of the DIA and the current strategic plan.

Background and Creation of the DIA

The creation of the DIA was approved by Secretary of Defense Robert McNamara on July 5, 1961, with a public announcement on August 1, 1961. It became fully operational on October 1, 1961. The creation of the DIA was a response to a Joint Study Group recommendation; during the Eisenhower presidency, the Joint Study Group had reviewed military intelligence activities with a view to their reorganization under a single intelligence organization. The Joint Study Group (led by the former inspector general of Central Intelligence Agency Lyman Kirkpatrick) reported on the need to have an organization that would have oversight of all

military intelligence activities. A central organization was required, because before the establishment of the DIA, each intelligence division within the navy, the Marine Corps, army, and air force coordinated its own intelligence activities and did not necessarily share intelligence among the other services.

The creation of the DIA was made possible by the 1958 Department of Defense Reorganization Act, which paved the way for the coordination of intelligence activities by a central agency in that it allowed for a shift of intelligence activities away from the traditional military sources (army, etc.) to the secretary of defense and Joint Chiefs of Staff. In this sense, the DIA filled the gap that existed between the various intelligence services, as its aim was to function as an umbrella organization that oversaw the coordination and dissemination of intelligence. The seal of the DIA features an image of the world globe surrounded by the universal trademark representing the atomic ellipse. A flaming chalice sits atop the world, which in turn is surrounded by the 13 stars and wreath symbolic of the Department of Defense.

The first director of DIA was Lieutenant General Joseph Carroll (October 1961 to September 1969) from the U.S. Air Force, and he was confronted with instability in Germany, Soviet Russia, and Cuba, as well as China. The attempts by DIA to coordinate the intelligence activities of different agencies, as well as gathering its own intelligence at such a tumultuous time, did not endear it to the existing intelligence community who saw it as interfering with their own internal intelligence-gathering operations. Despite early misgivings about the role of the DIA within the intelligence community, its place was solidified when it was designated as a combat support agency in 1986 with the director as the principal advisor to the secretary of defense. The director also reports to the Joint Chief of Staffs and has a wide support role.

Operational Support

Operationally, the DIA supports the Directorate for Analysis and each of the four centers associated with it (the Underground Facility Analysis Center, the Joint Intelligence Task Force for Combating Terrorism, the National Center for Medical Intelligence, and the Missile and Space Intelligence Center). In addition, the DIA has oversight for intelligence-gathering activities of the military, notably, the Air Force National Air and Space Intelligence

Center, the Office of Naval Intelligence, the Army National Ground Intelligence Center, and the Marine Corps Intelligence Activity Center. Acting as a designated combat support agency also allows for the DIA to be involved in specific command support centers.

The Military Intelligence Board

Under the Plan for the Activation of the DIA (1961) and as part of the organizational structure of the DIA, an advisory board called the Military Intelligence Board (MIB) was created. The MIB's board structure consisted of the head of DIA and various DIA planning staff as well as intelligence heads from the army, navy, air force, and Marine Corps acting as an ad hoc advisory board. The MIB reported on and collated intelligence to the DIA. The success with which the MIB implemented the Plan for the Activation of the DIA (1961) ensured that it remained a viable part within the wider DIA organization and thus was kept operational.

DIA Presence in the Persian Gulf War

The role of DIA as an intelligence support organization grew substantially both before and during the Persian Gulf War in 1991. Interagency cooperation and the role that DIA played in its facilitation were especially evident during Operations Desert Shield and Desert Storm. Prior to Operations Desert Shield and Desert Storm, the DIA had opened a U.S. Defense Attaché Office in Baghdad as early as 1985 in an attempt to collate intelligence at the source and to disseminate this as appropriate among the intelligence community. The success of the U.S. Defense Attaché Office led to the establishment of the Operational Intelligence Crisis Center in 1987 to further expand intelligence capabilities. From 1988 onward, the DIA had 24-hour intelligence coverage, which fed back into the intelligence community and ultimately culminated with the then general Colin Powell awarding it a Joint Meritorious Unit Award for exemplary performance during the operations.

DIA in Afghanistan, Iraq, and the Global War on Terrorism

The DIA's usefulness in accessing and collating all intelligence sources was evidenced by its ongoing ability to brief the intelligence community

on issues at hand and as they unfolded. The DIA was also instrumental in all-source intelligence gathering in both Afghanistan and Iraq for Operations Enduring Freedom and Iraqi Freedom and deployed thousands of people in support of the operations. The DIA supported the Global War on Terrorism through the establishment of a Joint Intelligence Task Force for Combating Terrorism, which sought all-source intelligence and provided the lead intelligence source for the Department of Defense.

Strategic Operations

The DIA's future strategic operations focus squarely on improving interagency cooperation, especially in light of rapid technological advancement where information and sources may change frequently. For example, in 2006, the DIA created the Defense Joint Intelligence Operations Center, which collaborates with the Department of Defense. The main function of the Defense Joint Intelligence Operations Center is to assess competing intelligence requirements and provide appropriate solutions to its intelligence stakeholders.

However, in line with its focus on increased intelligence sharing, the DIA has also been expanding its role in support of humanitarian aid and was a major contributor to aid under Operation Unified Assistance in relation to the South Asian tsunami in 2004.

DEFENSE LANGUAGE INSTITUTE

The Defense Language Institute Foreign Language Center (DLIFLC) provides language training for all military branches and Department of Defense civilians. Enacted during World War II, the DLIFLC has grown dramatically in response to U.S. needs around the world. New training methods and qualified instructors have improved language education. The DLIFLC also supports the language needs of deploying troops. This entry discusses the history, facilities, and programs of the DLIFLC.

History

The DLIFLC was created out of need shortly before the United States entered into World War II. There was an immense need for Japanese speakers when the U.S. Army created a clandestine school in San Francisco. On November 1, 1941, 60 students, mostly second-generation Japanese (nisei), and 4 instructors began school in an old airplane hangar.

The school continued to grow throughout World War II and became known as the Military Intelligence Service Language School (MISLS). The facility was moved twice, as Japanese Americans were moved to internment camps in 1942. Thousands of graduates of the MISLS program served in the Pacific throughout the war and during the occupation.

Following World War II, at the introduction of the Cold War, the school, renamed the Army Language School, moved to the Presidio of Monterey in California. New instructors were brought in to expand the program, teaching 30 languages. To meet America's Cold War needs, the Russian language program grew the fastest, followed by Chinese, German, and Korean.

Until the 1960s, both the U.S. Air Force and U.S. Navy had separate methods of teaching foreign languages. The air force used programs at universities like Syracuse, Yale, and Cornell. The navy had its own school in Washington, D.C., the Naval Intelligence School, to teach foreign languages. The Department of Defense determined that it would be more efficient to combine the programs and created the Defense Foreign Language Program in 1963 at the new Defense Language Institute (DLI) in Washington, D.C.

Foreign language training grew faster during the height of the Vietnam War. The DLI conducted its regular language programs throughout the war. Between 1965 and 1973, more than 20,000 soldiers were taught Vietnamese through regular DLI programs and shortened survival courses. When the U.S. Army Training and Doctrine Command was formed, it gained control of the newly renamed DLIFLC, which had moved its headquarters back to Monterey.

After Vietnam, the student population at DLIFLC continued to change. Women were now welcome in many military jobs, and the fighting force consisted of only volunteers. The school was awarded academic accreditation in the late 1970s, and the increase in students led the DLIFLC to open two other branches to accommodate the need. Lackland Air Force Base in San Antonio, Texas, hosted air force students of Russian from 1981 to 1987 and another school was located in San Francisco for army students in four languages. The Presidio also expanded its facilities.

Present

The DLIFLC has made academic excellence a top priority. New instructional materials and methods have been implemented and the instructor-to-student ratio is 2 per 10-student section. Through the new Proficiency Enhancement Program, the ratio has further decreased, where the ratio is down to 6 students per 2 instructors in the more difficult languages (Categories 3 and 4). The U.S. Congress granted the authority to DLIFLC to award associate of arts degrees in October 2001, and the school granted the first degrees in 2002.

In the last two decades, the DLIFLC has responded to several global initiatives, including Operation Desert Storm, the War on Drugs, and verification of arms control treaties. DLIFLC also reacted quickly following the events of September 11, 2001, creating the Emerging Language Task Force, which responds to problems throughout the world by offering language instruction to match changes in the deployment of American forces abroad, most notably in the Middle East and Central Asia.

The DLIFLC currently teaches 24 languages and several dialects. Duration of courses range from 26 to 64 weeks, depending on what language is taught, and students attend class 5 days a week. Instructors

come from a wide range of backgrounds, and 98% of instructors are native speakers of the languages taught.

The school only hosts Department of Defense civilians and service members from all branches of the military as students. Applicants for the Basic Program are required to have a high school diploma and take the Defense Language Aptitude Battery (DLAB). A score of 95 on the Defense Language Aptitude Battery qualifies the applicant to study Category 1 (French, Italian, Portuguese, and Spanish) languages, while scores of 100 qualify for Category 2 (German). To study a Category 3 language (Hebrew, Hindi, Kurmanji, Pashto, Persian-Farsi, Persian-Dari, Russian, Serbian and Croatian, Sorani, Tagalog, Thai, Turkish, Uzbek, and Urdu), a score of 105 is required. The most difficult languages, that is, Category 4 (Arabic, Chinese, Japanese, Korean) require a score of 110 or higher. Refresher or Advanced Program admissions depend on the level of the language proficiency of the applicant. There are more than 3,000 students at any point in Monterey, and more than 170,000 students have graduated from a DLI program since its inception in 1941.

To further achieve proficiency, DLIFLC has created an Immersion Program. Students and instructors spend 1 to 3 days in the isolated facility, completing real scenarios like shopping at a market place, traveling overseas, and making hotel reservations. Students may also be sent abroad for a month-long immersion. Thirteen sites across the United States contain Language Training Detachments, where instructors teach refresher and continuing education courses.

In addition to continuing education, the DLIFLC also contains the Field Support and Special Programs Division. Before deployments, service members receive language training as well as cultural awareness classes. Units may request Mobile Training Teams year-round. The DLIFLC lends additional support by shipping thousands of Language Survival Kits to troops deploying. The kits are designed to be used in the field and are produced in more than 30 languages.

DESERTION

There are several forms of absence from military duty, with desertion being the most serious. Desertion has been a problem for the U.S. armed forces throughout their history, but its frequency has changed dramatically. It was far more prevalent in the 18th and 19th centuries than later. Just as U.S. society has changed radically, so have the composition of the armed forces and the incidence of desertion. Standards for entering the armed forces, even in wartime, are higher than they once were. More and more service members are specialists, often serving in support roles rather than in combat units, perhaps thereby helping to reduce desertion. This entry examines the history of desertion in the U.S. armed forces from the 18th century to the present, factors that contribute to desertion, and punishments.

Background

Escaping from military service was relatively easy in a largely rural society that lacked the extensive communications and law enforcement networks that exist today. Societal attitudes, furthermore, have been vastly transformed. During the 18th and 19th centuries, many civilians had a strong prejudice against standing armies, and they encouraged desertion and aided deserters. Now, an increased degree of governmental control over individuals is generally accepted. Paradoxically, desertion rates in the services during periods when conscription was in force have been lower, often much lower, than in periods when the armed forces were dependent on recruitment.

Within recent decades, military personnel who have left their duty stations without permission have generally been listed as deserters after 30 days. Only absentees who seem to have intended to leave military control permanently are likely to be charged with desertion, but remaining away from military control for more than 30 days shifts the burden of

proving intent from the government to the accused. In the past, desertion has often been construed as any absence, especially in combat areas. Thus, some service members were listed as deserters simply because they had become separated from their companies and fought in other units. Charges were dropped when the absence of a crime became apparent.

Offenses related to desertion are absent without leave or an unauthorized absence of less than 30 days and “missing a movement,” the failure of a service member to move between duty stations when ordered. Missing a movement to a combat area is likely to have more serious consequences than failure to move in accord with orders not involving combat duty.

Causes for Desertion

Although cowardice has certainly led to many desertions, the offense has been frequently caused by a revulsion against some or all features of military life. In the late 19th century, some soldiers even deserted because they objected to being sent to school to learn to read and write. Others disliked working with horses, which explains why, at times, more cavalrymen and artillerymen than infantrymen deserted. More substantial reasons for desertion in past centuries were the failure of Congress to provide pay in a timely manner and the all too often lack of decent food and even uniforms.

In many instances, personal problems, including family responsibilities, have been intensified by military service and have led to desertion. During the American Revolution, in particular, many members of the armed forces left the army to harvest crops to support their families. In the 19th century, the labor involved in building and maintaining military installations alienated some soldiers, who compared themselves to better paid civilian laborers who enjoyed more freedom. When civilian jobs were readily available and were paying well, some service members deserted. Depressions, however, encouraged enlistments, not desertions, although in the Great Depression, some soldiers deserted because they could earn more in the Civilian Conservation Corps.

There have been numerous other causes for desertion. In the War of 1812, many apprehended deserters pointed to their well-founded fear of disease as their reason for leaving. In the

19th century, some men joined the army for free transportation to the West. The proximity of gold fields, moreover, was a lure for service members. In the Mexican-American War of 1846–1848, some regular army soldiers deserted to join volunteer units, which had much less rigorous discipline. From the American Revolution until after the Civil War, bounties, that is, bonuses, were paid to many recruits during both peace and war. The provision of such rewards, not surprisingly, led some men to become “bounty jumpers,” that is, to enlist in a military organization, then desert, and join another military organization, in order to secure another bounty.

Desertion has been very largely, but never wholly, an offense committed by enlisted personnel, especially those at the lowest ranks and, in particular, early in the deserter’s service. Many deserters have had little education, and in some instances, they may not have grasped the seriousness of their actions. Although most of the many immigrants in the armed forces have served well, often with distinction, immigrants in past times deserted in relatively large numbers, suggesting that they may not have developed much attachment to the United States. Drunkenness has often been a precipitating factor in the decision to desert.

Desertion Rates

The desertion rates that follow come from what appear to be reliable sources, but statistics, in particular before the 20th century, must be viewed with at least some caution because of the incompleteness of surviving records. The meaning of the terms *desertion* and *absent without leave* have changed at times, moreover. During World War I, draft evaders were considered deserters, for example. The desertion rate in a given military service or during a particular campaign may differ considerably from global numbers for a war or other time period.

In the Revolutionary War, approximately a quarter of the soldiers deserted. About 13% of the army deserted in the War of 1812. During these conflicts, moreover, substantial numbers of soldiers left in whole groups. The overall rate for the army between 1815 and 1861 was about 15%, although the ratio of army deserters to recruits sometimes amounted to 50% or even more a year. During the Mexican-American War, the desertion rate was below 7%,

a fact that may be attributed to the relative brevity and highly successful course of the war.

The Union Army experienced substantial numbers of desertions as early as 1862. Overall, the desertion rate was about 9% or 10%, with a much lower rate in the navy. Nevertheless, enough men, including numerous African Americans, stayed in service to defeat the Confederacy. Despite the stake they had in the Civil War, African Americans deserted the Union Army in significant numbers. Often, they were assigned to extremely demanding labor duty, and for much of the conflict they were paid less than Whites. For years after the Civil War, African Americans deserted from the army at substantially lower rates than White soldiers because of their benefits and the prestige their service gave them among African Americans. The South had great difficulty in keeping its armies together; its inability to do so was a major factor in its loss of the war. The desertion rate may have been between 8% and 13%. The outnumbered Confederates could sustain such losses even less than federal forces. The increasingly dim military prospect for the South was an extremely important motive for desertion, especially in the last months of the war.

After the Civil War, the army returned to an average annual desertion rate of approximately 15%. In 1871, however, about one third of the army deserted. Retention improved during the 19th century, partly as a result of salary increases and improved living conditions, but there were still many desertions. In 1906, for example, the army desertion rate was 7.4%. The navy suffered even more severely. Between 1900 and 1908, at least 14% of enlisted personnel deserted each year. In 1880, the rate had been about 12%, so there had been no improvement in the retention of sailors.

Desertions during World War I were markedly fewer than ever before, running to only about 1%, aside from draft evaders. The short duration of the conflict for the United States and the general confidence among soldiers and sailors about the success of the war effort were factors in keeping the desertion rate low. During World War II, desertion rates increased over those of 1917–1918, with an army high of 6.3% in 1944. Although military discipline deteriorated during the Vietnam War era, desertion rates never reached those of the 18th- and 19th-century wars. They were only marginally higher than those recorded for the Korean War years. Rates

ranged from 1.49% to 7.35%. More recently, rates have been highest for the army and marines and the lowest for the air force, with the navy somewhere between the other services.

Punishment for Desertion

The incidence and severity of punishment for deserters has varied considerably. In the 18th and early 19th centuries, the armed forces did not have prisons, so punishment usually took the form of execution or some combination of running the gauntlet or physical mutilation, such as branding or cutting off one ear or both ears, frequently in addition to flogging and dismissal from the service. During the American Revolution, moreover, many deserters were prepared for execution, but then their lives were spared at the last moment, a measure that was also used in the War of 1812. Deserters, other than those who had defected to the British, were usually executed only if they were repeat offenders. In the course of the War of 1812, executions increased rapidly, owing to the increased desertion rate. Congress abolished the death penalty for desertion during peacetime before the Civil War. Several hundred Union soldiers, many of them "bounty hunters," were executed, although there were huge numbers of deserters.

In the early 20th century, desertion continued to be a major offense, but punishments continued to vary significantly. In some cases, men were given dishonorable discharges after prison, but others suffered only fines. The use of capital punishment has decreased and has now been effectively eliminated. Only a single execution for desertion occurred in World War II when higher commanders in the European Theater of Operations thought an execution was an absolutely necessary deterrent. Some other World War II offenders were sentenced to death, but the sentences were later changed to prison terms; others received long prison sentences. Following the war, these punishments were reduced significantly. The magnitude of the problem has declined steadily, thereby putting in question the need for the most drastic sanction. Execution has never seemed to be a particularly useful weapon against desertion, moreover. Then, too, support for capital punishment in the United States has declined generally over the years, especially in regard to crimes other than murder.

Deserting to the enemy has been an especially heinous crime that has often been punished by death. A number of soldiers and sailors deserted to the British during the American Revolution. In the Mexican-American War of 1846–1848, several hundred U.S. soldiers served in the Mexican Army. These deserters have often been portrayed as Irish Americans who sympathized with the Catholic Mexicans. Although they were organized as a Saint Patrick Battalion, only a portion were Irish. Some of its members were immigrants from other countries, and many others were native born. Religion does not seem to have played a significant role in the episode. Fifty of these deserters were executed. There were significant desertions to the opposing forces in the course of the Civil War, too, but deserting to the enemy was a course taken by very few during the two World Wars or counterinsurgency campaigns. During the Philippine-American War, 1899–1902, a few African Americans joined the Philippine nationalist forces.

After the Vietnam War ended, some political leaders believed that those who had unlawfully avoided military service, and perhaps those who had deserted, should be treated mercifully. President Gerald Ford offered a complicated scheme for allowing draft evaders and deserters to undertake "national service" to compensate for time not spent in the military. The plan was unpopular, and relatively few people took advantage of it. Later, President Jimmy Carter gave draft evaders an amnesty, while conceding nothing directly to deserters. Some deserters, however, were successful in having their discharges changed, if they had only deserted after having served a full tour of duty in Vietnam.

Despite the seriousness of desertion in the past, punishment has not been the only way to combat the problem. Amnesties have been very much a part of efforts to counter the effects of desertions, especially during wartime. George Washington offered several amnesty periods for soldiers who would return to the army, despite his conviction that deserters merited harsh treatment, including capital punishment in many instances. Early in the 19th century, general pardons were issued for all deserters. The Confederacy issued amnesties several times, the last one in 1865, but such measures were ineffective in dealing with the offense.

In good part, the seriousness with which desertion is viewed by the military depends on the need for personnel. The value of apprehending deserters

has to be weighed, even apart from the question of punishment. Before the advent of the Federal Bureau of Investigation, catching deserters necessitated employing troops, who were lost to combat or support operations. Deserters are unlikely to become very useful to the armed forces. Instead, they are likely to repeat the offense. After the conversion from conscription to voluntary military service in the 1970s, the Government Accounting Office pointed to the expense of pursuing deserters who were generally discharged as unsuitable after their apprehension. Perhaps following that advice, the armed services have not been making strenuous efforts to apprehend deserters within recent years. Deserters are generally receiving relatively brief prison terms, moreover.

DESTROYERS

The warship type known as the destroyer came into being during the period from 1868 to 1900. As a ship class, destroyers are a good example of how technology can drive ship design and type. They also highlight how warship design must balance speed, endurance, armament, and maneuverability against purpose. Steam and torpedoes gave birth to the original destroyers. Today, the term *destroyer* refers to a multimission surface warship capable of any number of tasks. These include hunting submarines, air defense, and even overland strike using cruise missiles. The standard warship of today is a destroyer, and all the surface fleets of the world are essentially built around this type of ship. This entry provides a brief history of the destroyer, then discusses its roles, designs, and capabilities.

It all started with the British. Robert Whitehead produced the first self-propelled torpedo in 1868 using compressed air as propulsion. Shortly afterward, the Royal Navy decided that the most promising class to mount torpedoes on were small, cheap, steam-powered patrol boats because of their speed. When this craft was combined with the new self-propelled torpedo, a new and dangerous ship class emerged—the motor torpedo boat (MTB). The MTB posed a threat to all large ship classes and was ideal for coastal defense. The near-simultaneous invention by John Holland of the first submarine, really a submersible MTB, only heightened the fear that these new weapons caused in their day. It was not long, however, before naval designers proposed a smaller and cheaper class of ship to destroy MTBs. This was the birth of the destroyer. Its sole purpose was to defend the battle line, or the merchant ships, against the attacks of swarms of MTBs. The first two true destroyers were built in Britain in 1892 and displaced 275 tons each. It was not long before they were among the most ubiquitous class of ship in every navy. They were often armed with 3- or 4-inch-caliber guns, plus torpedoes, and later

machine guns to defend against both MTBs in close combat and that other new technological marvel, the airplane.

New missions accrued rapidly for these fast, maneuverable warships. They eventually came to assume the role of the MTB in the open ocean fleet engagement and at the tactical level would continue in this role up through World War II. Naval history is filled with exciting charges by “squadrons” of destroyers against larger ships launching salvoes of deadly torpedoes. Among the most famous examples of this tactical use of destroyers are Jutland (World War I), around Guadalcanal by the Japanese (World War II), and the Battles of Surigao Strait and Samar off Leyte (World War II).

The most effective role for the destroyer came against its most fearsome opponent, the submarine. It was against these “terror” weapons, first in World War I and throughout World War II and the Cold War, that destroyers established their fearsome reputation as sub killers. With the addition of the helicopters, destroyers could hunt submarines with “dipping sonars” lowered from the hovering helo—the major tactic for sub hunting and destruction today. Destroyers also fulfilled other less glamorous, but important, roles, often known as sea control—missions like convoy escort, antipiracy patrol, and search and rescue. In addition to their antisubmarine warfare (ASW) missions, they came to serve as important antiaircraft ships protecting the aircraft carrier, transport, and amphibious shipping.

During the Cold War, the destroyer performed all these missions—going from specialized classes to the one-size-fits-all destroyers of today’s modern fleets. After World War II, it seemed that the destroyer had no natural enemies left, and navies slashed their inventories of destroyers. With the coming of the Korean War, and later Vietnam, destroyers gained a new lease on life as naval gunfire support ships. As the Soviet Union built up its submarine fleet in the late 1950s, the destroyer and the ASW aircraft carrier became the premier sea control task force of the North Atlantic Treaty Organization (NATO) navies, forming “hunter killer” groups, a concept proven during World War II. Later, when the Soviets deployed long-range maritime strike bombers, the destroyer was modified by NATO navies as the antiaircraft-guided missile destroyer.

The biggest design drawback of the destroyer, both today and when it was first put to sea, is its high fuel consumption. This is a result of its design criteria for both high speed and maneuverability. In particular, maneuverability is a function of size, the smaller the more maneuverable—too small means that the destroyer cannot accompany the main fleet and in any case would spend all its time refueling. In the unending cycle that is warship evolution, the destroyer gave life to another war-winning concept, the fleet oiler, without which the destroyer is practically useless. During the Cold War, Admiral Hyman Rickover tried to produce a nuclear powered destroyer, the USS *Bainbridge*, but this ship’s upkeep and expense proved unsuitable to the role that destroyers had come to play as the backbone of any modern surface warfare fleet. To justify the expense, *Bainbridge* was reclassified as a cruiser.

Since the end of the Cold War in 1991, the destroyer has become *the* multipurpose surface warship. It is still the primary ASW ship in most navies, always, as mentioned, with ASW helicopters aboard. It also has the role of a surface-to-air missile platform, capable of shooting down enemy aircraft at both low altitude and high altitude at great distances to protect high-value units like convoys or aircraft carriers. Since the Persian Gulf War of 1991, navies have also placed long-range cruise missiles, such as the U.S. Tomahawk land-attack cruise missile (TLAM) on United States and some NATO warships. These missiles can attack targets hundreds of miles inland using satellite guidance. Recently, in Libya, 2011, NATO destroyers performed this function, called strike warfare, in attacking Muammar Gaddafi’s air defense systems. These same ships have also been used to attack terrorist targets.

The People’s Republic of China is building vast quantities of destroyers—although they only have a couple of the multimission types. The premier destroyer in the world today is the *Arleigh Burke* class of the U.S. Navy. In fact, the United States no longer builds cruisers and has gone to the destroyer as its largest surface combatant class of ship. These ships, in addition to performing all the missions mentioned, also have the most advanced surveillance radar in the world, the SPY-1D. This radar, when coupled with the latest software and missiles, is the only sea-based

missile defense system in the world that can defend against intermediate-range ballistic missiles.

DETERRENCE

"Deterrence," explains the title character of Stanley Kubrick's 1963 film *Dr. Strangelove*, "is the art of producing, in the mind of the enemy, the fear to attack." While an object of ridicule in the film, the good doctor was right. At about the same time that Kubrick was explaining the emerging theory of deterrence to the world, a young Harvard University professor, who would shortly make a name for himself outside the hallowed halls of academe, ventured his own remarkably similar definition. In his 1962 study, *The Necessity for Choice*, Henry Kissinger explained the following:

Deterrence is finding a way to make an adversary realize that there is danger, and that this danger is greater than the benefit that might be realized, and as a result the adversary does not dare take a particular course of action. (p. 12)

A decade later, the political scientists Alexander L. George and Richard Smoke, in their classic 1974 study, *Deterrence in American Foreign Policy: Theory and Practice*, defined deterrence as "simply the persuasion of one's opponents that the costs and/or risks of a given course of action he might take outweighs its benefits" (p. 11). As the reader clearly can see, the general explanation or goal of deterrence remained

constant throughout the Cold War. Its theoretical underpinnings, however, have changed a good deal. This entry examines deterrence theory and the history of deterrence, with a focus on U.S. policies.

Deterrence Theory

During the Cold War, rational choice, also known as cost-benefit analysis and game theory, dominated the writings on deterrence. Writers in the cost-benefit analysis school presuppose that the actors are rational and will apply a classic cost-benefit analysis. They further presuppose that if the costs of challenging another actor are too great, then the rational acting challenger will back down and deterrence will succeed. While studies confirm that this theory played out successfully during the nuclear age, when American nuclear power deterred the Soviet Union on countless occasions, conventional forces as often as not failed to deter challengers prior to 1945. In particular, weaker states while fearing the costs of military action sometimes perceived that inaction carried greater risks.

A second theoretical approach, game theory, pioneered by Thomas C. Schelling during the 1960s, also presupposed rational actors that were motivated by goals that can be rationally calculated and quantified. Game theory, however, made greater use of psychological factors and recognized that success depended in part on credibility, which is the ability to convince an opponent that a given action will invite severe consequences. In what some game theorists refer to as a "chicken game," the deterring actor must convince the challenger that it will not back down in the face of threats no matter how severe and that the deterring party will even accept its own destruction. This refinement of game theory led, during the Cold War, to the concept of mutually assured destruction. A counterpart to mutually assured destruction, proportional response, which evolved at about the same time, stressed that to retain credibility, deterrence must be proportional to the issue at stake; put another way, a defender cannot deter an aggressor when the only means at its disposal is massive retaliation and a general nuclear war. Game theory then, far more than cost-benefit analysis, sees deterrence as a fluid or ongoing process where the actors are constantly evaluating information.

In the 1970s, during the so-called third wave of deterrence writings, scholars began to question the

very utility of deterrence. Like the earlier schools, these newer writers recognized that incomplete or inaccurate information often undermined deterrence. They further reasoned that given its limited value and tendency to strain relations between Washington and Moscow, thereby making a fundamental readjustment of Soviet-American relations impossible, policymakers should reevaluate the entire strategy.

Deterrence in History

Although major writing on deterrence began with the nuclear age, the concept itself dates back to ancient times. And while successful in restraining the superpowers after 1945, deterrence failed as often as not in the prenuclear era. Thucydides, the great chronicler of ancient Greece, for example, recounts in his epic history of the Peloponnesian War how both sides used, with limited success, what today is known as deterrence. The failure of Athenian naval deterrence, in fact, led to conflict with Corinth and eventually the Peloponnesian War, a generation-long death struggle with Sparta. In all likelihood, deterrence failed in ancient Greece because neither antagonist maintained a sufficient military advantage to convince its opponent that it possessed a credible deterrent. Likewise, while Titus Levy's history of the Second Punic War recounts multiple instances where Roman might and the reputation of its forces deterred Hannibal from taking aggressive action, Roman military power did not deter the weaker Carthage from challenging the Roman-imposed status quo.

Deterrence's checkered record continued into modern times. During the early 19th century, not even the greatest coalition of European powers, led by Britain at sea and Austria and Russia on land, could deter Napoleon. At the dawn of the next century, Russia's dominance on land and sea could not deter upstart Japan from humiliating Tsar Nicholas II and redrawing East Asia's geopolitical map during the 1904–1905 Russo-Japanese War. Japan's decision to fight in 1904 is especially important in that it illustrates what game theorists had hypothesized—a rational state using cost-benefit analysis can reasonably decide to go to war because the costs of inaction are as great, if not greater, than the cost of action.

A decade later, deterrence failed spectacularly as neither the Franco-Russian buildup on land nor

England's dominance at sea deterred the Central Powers from starting Europe's greatest war since Napoleon. John H. Maurer rightly concluded in his 1995 study, *The Outbreak of the First World War*, that deterrence failed in 1914 because of Britain's unwillingness to offer ironclad guarantees to defend France and upgrade its own land forces.

American Deterrence

Within a generation, American leaders learned firsthand the limits of deterrence. In response to the Second Sino-Japanese War, which began in July 1937, Tokyo's decision to join the Tripartite Pact in September 1940, and the general power vacuum in Asia that occurred because of the Anglo-Soviet preoccupation with Nazi Germany, the Franklin D. Roosevelt administration attempted to deter further Japanese aggression in Asia. For nearly 3 years, Washington used military and economic deterrence to halt Japanese expansion only to see the policy fail on December 7, 1941. As was the case in 1904, Japanese leaders decided that the cost of inaction, which in this case meant exhausting the country's oil reserves within a year, was worse than fighting a coalition of stronger powers.

America's deterrence began in the summer of 1938 when, in response to the worsening situation in Asia, Congress approved the Second Vinson Trammell Act, which provided for the construction of 3 battleships, 2 aircraft carriers, and some 40 other vessels. The fall of France in June 1940 provided an impetus for naval expansion and before the summer of 1940 ended, Congress approved two additional naval expansion bills, including one designed to produce a true two-ocean navy. By this time, the Pacific Fleet had already been transferred from the West Coast to Hawaii to deter Japan. In addition to naval deterrence, Washington also used the threat of American air power to thwart Japanese expansion. During the summer and autumn of 1941, the War Department rushed the new American B-17 bomber to the Philippines, where Army Chief of Staff George C. Marshall and Secretary of War Henry Stimson believed that they might deter a Japanese strike South.

By the summer of 1941, American economic deterrence had actually run ahead of military measures. In the summer of 1940, Congress approved an export control act that allowed Washington to

embargo select raw materials and finished goods vital to the Japanese war machine. In theory, by embargoing only certain goods, the United States would deter Japan from further acts of aggression by threatening to curtail the sale of goods not yet subject to the embargo. By the summer of 1941, the United States had stopped selling to Japan nearly all vital raw materials, save for oil, and in July 1941, Washington froze Japanese assets and brought all U.S.-Japanese trade to a halt following Tokyo's absorption of the southern half of French Indochina.

Unfortunately, American deterrence failed to halt Japan and may even have accelerated the onset of the Pacific War. In the run-up to Pearl Harbor, Japanese navy chief of staff Osami Nagano described American deterrence as "iron chains" that Japan must fight to break. For Japan, the prospect of a potentially ruinous war was better than the further sanctions and additional American military preparations. Fortunately, during the long Cold War that followed the end of World War II, deterrence proved more successful.

Deterrence and the Cold War

During the nearly five-decade-long Cold War, both the United States and, after 1949, the Soviet Union relied heavily on nuclear deterrence to protect vital national interests. During every decade of the long conflict, one side or the other put nuclear deterrence to the test. President Harry S. Truman, for example, used the threat of nuclear weapons early in the 1948–1949 Berlin Blockade in an attempt to compel the Soviets to reconsider their actions, and in 1950, Washington agreed to a vast expansion of American nuclear military power to deter Moscow.

However formidable, America's nuclear arsenal did not deter the Soviets from building the Berlin Wall in 1961 nor was deterrence uniquely American. Moscow's decision to base nuclear weapons in Cuba was intended in part to protect the isolated communist outpost, but here too deterrence failed in part because while the United States knew that Russia had planned to base nuclear weapons in Cuba, American officials did not know until 1992 that the former USSR (Union of Soviet Socialist Republics) had some 42 operational intermediate range nuclear weapons already on the island. Deterrence received its greatest test early in the 1970s, when the Nixon administration readied the nation's nuclear strike

forces to keep the Soviet Union from intervening in the 1973 Arab-Israeli War. Whatever his reason for resorting to nuclear deterrence—some suggested that it was an effort to deflect the nation's attention from Watergate—the gambit worked and the Soviets stayed out.

Post-Cold War Deterrence

Deterrence has survived the Cold War's end and while mutually assured destruction no longer dominates the geopolitical landscape, the doctrine still plays a role in shaping the relations between rival nuclear states such as India and Pakistan and no doubt moderates the behavior of new nuclear powers such as North Korea.

While successful in moderating the behavior of nuclear states, many of the inherent limitations of conventional deterrence have reemerged since the end of the Cold War. Despite Washington's military dominance in 1990, Iraq invaded Kuwait, confident that the United States would not intervene. Eleven years later, American power failed to deter al Qaeda, despite America's demonstrated commitment to military intervention in the Middle East. Deterrence's second critical failure in just over a decade quickly led to a decreased reliance on the heretofore favored policy and the rise of a new American defense doctrine, that of preemption: Striking an enemy before it attacks. The shift from deterrence to preemption in part explains the U.S. decision to invade Iraq rather than to rely on deterrence. By 2003, the architects of American foreign policy believed that the Republic could best be protected by the new policy of "confronting the worst threats before they emerge," rather than the decades-old policy of deterrence whereby the United States and others sought to keep the peace by "producing, in the mind of the enemy, the fear to attack."

DIRECT FIRE

U.S. Joint Publication 1-02 defines *direct fire* as “fire delivered on a target using the target itself as a point of aim for either the weapon or the director” (Department of Defense, 2010, p. 97). Put another way, direct fire is the use of any weapon to attack a target that is in the line of sight of the person/crew of the firing weapon or system using the weapon’s sights to aim at the target. Projectiles fired from direct fire weapons usually have relatively flat trajectories. This entry examines techniques, advantages, and disadvantages of direct fire.

Some weapons can utilize either direct or indirect fire to attack a target, such as artillery, mortars, or machine guns. In such cases, the key factor in differentiating between direct and indirect fire is whether or not the weapon is sighted directly at the target. If so, then this constitutes direct fire.

There are several advantages of employing direct fire. Direct fire is generally more accurate, particularly in terms of first-round effects, because the shooter can easily align the weapon with the target. The shooter can observe the effect of the rounds on the target and quickly make any necessary adjustments. The employment of direct fire is not without some potential disadvantages. The most important disadvantage is that the shooter may be exposed to direct fires employed by the target. In addition, the shooter’s weapon may have a signature that betrays the shooter’s location to the target.

Before the First World War, nearly all of the fires on the battlefield consisted of direct fire. This changed as the massive firepower of World War I armies caused each of the combatants to attempt to protect their artillery. Artillery pieces were moved to the reverse slopes of hills so that enemy artillery could not easily observe and attack them. Artillery

placed in defilade (protection provided by an obstacle, such as a hill, etc.) was safer but required observers to communicate where rounds were landing and to send corrections back to the firing battery. It was through this process that artillery became primarily an indirect fire weapon. World War I also saw the proliferation of other indirect fire means such as mortars. Even machine guns were occasionally used in an indirect fire role.

In modern conflicts such as Iraq or Afghanistan, where wars are conducted among the people, direct fire has taken on a renewed importance. The indiscriminate use of massive firepower can be extremely effective during conventional fighting, but it can also be counterproductive while fighting insurgents taking cover amid civilians. Direct fire is often more precise and more easily controlled than indirect fire. In addition, direct fires generally produce less collateral damage than relatively imprecise area fire weapons such as artillery and mortars. As a result, in counterinsurgency operations where protection of the population is an important goal, direct fire can make a significant contribution to mission success.

Proper direct fire planning is essential in both the offense and the defense. In the offense, units must be aware of the sectors for which they are responsible, even while on the move. This allows a unit to maintain security and to be prepared for enemy attacks at all times. For units on the march, there are a number of methods of assigning sectors of fire, such as the clock method or quadrants.

In the defense, direct fire plans must be carefully coordinated at every level to ensure that there are no gaps in a unit’s fire plan. Any areas that cannot be covered with direct fire are referred to as “dead space” or “dead ground.” If dead space is identified during direct fire planning in the defense, then indirect fires should be placed in such areas. Direct and indirect fires must also be carefully integrated with the obstacle plan to provide an effective defense.

There are a number of effective techniques used in orienting direct fires. It is possible to select prominent terrain features that are clearly distinguishable, even at night, and designate them as target reference points (TRPs). These TRPs can provide known points that permit troops to effectively engage enemy targets. TRPs may also be used as a means of distributing fires across a unit’s sector of fire.

The use of TRPs and other methods for controlling direct fires also helps prevent fratricide. This is particularly important given the increasing range and lethality of modern weapon systems. Fratricide is also often referred to as “friendly fire” or “blue-on-blue” engagements. There are a number of methods of preventing friendly units from accidentally engaging other friendly units with direct fire. These methods vary in effectiveness. For instance, infrared lights may be used to indicate the position of friendly elements. Such IR lights are often easily visible to other ground units in close proximity and even to attack helicopters that may be in support. The ability of fixed-wing aircraft to identify these infrared lights is more problematic as visibility depends on a variety of factors.

Direct fire is a critical element of the fires planning of any military force. Direct fire has taken on a renewed importance in the current operating environment as military forces attempt to root out enemy combatants attempting to hide among the civilian populace. Accurate direct fire results in less collateral damage and accidental civilian casualties than other, less precise, fires available to modern armies and can make a significant contribution to mission success.

DISABILITY

Disability, or the social consequences of physical or mental impairment, is a product of all military conflict. For as long as armies have fought wars, combatants have returned home bearing the physical and emotional scars of battle. This entry discusses advancements in caring for wounded U.S. service members, procedures for evaluating disability, and criticism directed at the Department of Veterans Affairs (VA) regarding posttransition care.

Background

Since the late 19th century, military physicians and scientists have made great strides toward limiting the numbers of troops either killed or permanently disabled because of wartime injury and illness. In World War I, advances in battlefield evacuation and emergency trauma care saved the lives and limbs of countless wounded men. In World War II, the introduction of penicillin and sulfa drugs reduced death rates even further, allowing war-injured combatants to fight off infections that would have been fatal only a few years earlier. In the Korean and Vietnam Wars, the use of evacuation helicopters and Mobile Army Surgical Hospitals dramatically decreased the transit time between a combatant’s point of injury and the site of definitive care—a key step in the reduction of permanent disability. Today, the Department of Defense (DOD) and the VA, working alongside civilian contractors and nonprofit organizations, have developed a wide range of assistive technologies and social programs to minimize the long-term effects of physical and psychological trauma. Despite such efforts, however, the era of disability-free warfare—predicted by military scientists as far back as the late 19th century—remains a distant fantasy. Since the start of the Global War on Terrorism in 2001, more than 30,000 U.S. troops have been wounded in combat, more than half of them requiring immediate medical transport back to the United States. To add insult to injury, the latest generation of disabled veterans continues to face many of the same

bureaucratic and institutional barriers that plagued their 20th-century counterparts.

Treatment and Recovery

For U.S. forces fighting in Afghanistan and Iraq, traumatic injury—both physical and mental—remains a constant hazard. To the surprise of military planners in Washington, both Operation Enduring Freedom and Operation Iraqi Freedom quickly devolved from mobile wars of maneuver into grinding antiguerrilla campaigns characterized by the use of “irregular” tactics on all sides. Unable or unwilling to wage war by conventional means, Afghan and Iraqi insurgents increasingly turned to homemade bombs and other improvised explosive devices—known in military jargon as IEDs—to shred the bodies of the American occupiers. In addition to extensive soft tissue damage, IED victims frequently suffer fourth degree burns, internal bleeding, and traumatic brain injury—sometimes referred to as the “signature wound” of the Global War on Terrorism. Some 50% of IED casualties exhibit prolonged headaches, memory loss, cognitive problems, and other symptoms of traumatic brain injury. Moreover, because the destructive force of IEDs is focused largely on their victims’ extremities, more than 500 Americans have returned from Afghanistan and Iraq as amputees, their bodies forever marked by wartime trauma.

Against this backdrop, the U.S. Military Health System has implemented a two-phase campaign to minimize the number of combat personnel permanently disabled through military service. The first phase focuses on saving the lives of U.S. casualties and optimizing their chances of functional recovery. It begins on the battlefield, with combat lifesavers or field medics providing U.S. casualties with immediate medical treatment. Once evacuated from the line of fire, wounded combatants move through additional levels or “echelons” of care, depending on the severity of their injuries. The first stop is usually a nearby aid station, where a small forward surgical team stabilizes the patient for further travel. From there, wounded service members are transferred to an army combat support hospital, a navy hospital, or an air force theater hospital, where military surgeons administer further treatment—such as reconstructive surgery and transfusion—before shipping them out of the combat theater. En route to

the United States, most injured Operation Enduring Freedom/Operation Iraqi Freedom troops make a brief stop at Landstuhl Regional Medical Center in Germany, the U.S. military’s largest overseas medical facility. Thanks to improvements in transportation, communications, and organization, the medevac process is remarkably efficient. During the Vietnam War, U.S. casualties typically waited 2 weeks or longer to receive definitive, off-continent care. Today, the same level of treatment is available in less than 13 hours.

Besides accelerating casualty evacuations, the U.S. military has taken numerous steps to minimize the legacies of traumatic injury. Each branch of the armed forces sponsors its own support group to assist combat casualties throughout the recovery process. In the early 2000s, military scientists introduced a series of fast-acting hemostatic bandages and tourniquets to reduce battlefield hemorrhage, one of the most common causes of combat fatalities in Afghanistan and Iraq. More significant still, in May 2004, the joint armed forces initiated the military’s first integrated system of in-theater trauma care. Based on civilian trauma systems developed in the aftermath of the Vietnam War, it was designed to streamline the casualty treatment process by eliminating structural redundancies and improving echelon-to-echelon communication. To complement such efforts, the military also developed a variety of instruments, including the Joint Theater Trauma Registry, a web-based medical database, to collect and manage information about combatants’ injuries.

Some of the most noteworthy medical achievements of the Global War on Terrorism have come in the field of prosthetics. Since 2001, researchers at the Defense Advanced Research Projects Agency’s Revolutionizing Prosthetics program and other prosthetic laboratories have introduced a number of high-tech artificial hands, feet, and limbs, many embedded with electronics to facilitate fluid motion and fine-tuned control. A follow-up to their popular C-Leg (first developed in the mid-1990s), Otto Bock HealthCare’s latest design incorporates microprocessors and hydraulic cylinders to anticipate users’ movements and sense changes in terrain. Many Operation Enduring Freedom/Operation Iraqi Freedom amputees undergo physical therapy at Walter Reed’s Military Advanced Training Center, a 31,000-square-foot training and rehabilitation center located in Washington, D.C. One of the

largest facilities of its kind, the Military Advanced Training Center features a state-of-the-art gait lab, where military orthopedists use video imaging to record amputees' movements while wearing their prosthetics. In addition, the center hosts virtual reality simulations in which patients learn to readapt to their new lives as veteran amputees.

Transition

On conclusion of their medical treatment, many severely injured patients prepare to enter the second phase of the Military Health System's integrated program for casualty care: the transition to civilian life. In military parlance, *transition* generally refers to the separation of personnel either from combat status or from active-duty service altogether. The DOD has instituted a multistage Disability Evaluation System to assess if a service member's injuries warrant transition and, if need be, disability compensation. First, a Medical Evaluation Board, usually composed of two or three military physicians, decides whether an injured service member can resume his or her military occupational specialty. If that is not the case, a three-member Physical Evaluation Board convenes to determine if the injured party is fit to continue in military service. The Physical Evaluation Board also assigns the injured service member an official disability rating based on a schedule published by the VA.

Although the VA doesn't offer a specific definition of disability, its ratings schedule is designed to quantify both the loss of bodily function and the degree to which a service-connected condition negatively affects an individual's capacity for social and economic readjustment. Ratings are expressed as percentages of 10, and they range from 0% to 100% (e.g., 100% disability), depending on the severity of impairment. On separation from service, veterans with ratable disabilities are qualified for an array of federal benefits, including vocational training, psychological counseling, and monetary compensation. Besides treatment at a VA medical facility, some disabled veterans are eligible for small grants toward the purchase of specially adapted housing, clothing, and automobiles. The VA also provides domiciliary and nursing home care for disabled veterans undergoing rehabilitative training or in need of long-term medical assistance.

In recent years, the VA and DOD have taken a holistic approach toward the issue of disability

transition. All major military hospitals staff transition assistance teams and the VA offers a variety of work-study and educational programs to help disabled veterans readjust to civilian life. Both the DOD and the VA host websites and informational hotlines dedicated to disability assistance, and the entire Military Health System places great emphasis on the social and psychological obstacles facing newly disabled veterans, including those suffering from posttraumatic stress disorder. Located in more than 200 communities across the United States, VA-sponsored Vet Centers offer a range of counseling and outreach services for disabled veterans and their families. VA and military personnel also work closely with private veterans' groups such as the Disabled American Veterans and the Wounded Warrior Project to provide support for disabled veterans throughout the transition process and beyond.

Problems and Legacies

Despite the VA's efforts, however, the federal government's treatment of disabled combatants remains seriously flawed, particularly when it comes to delivering posttransition compensation and care. Since the start of the Global War on Terrorism in 2001, disabled veterans and their families have encountered a number of problems negotiating the vast VA bureaucracy, even with the help of government-appointed counselors. Disability claims routinely take months to process, and the typical wounded combatant has to fill out more than 20 forms to receive disability benefits. Many veterans believe that the VA disability ratings schedule is too rigid, downplaying certain kinds of "invisible injuries," and the armed forces have been slow to recognize the long-term effects of traumatic brain injury on combat casualties returning from overseas. No less troubling, the Military Health System has been plagued by scandal at all levels. In February 2007, *The Washington Post* reporters Dan Priest and Anne Hull published a series of devastating exposés of conditions at Walter Reed Medical Center, the nation's premier treatment facility for disabled combatants. They found patients living in squalid, vermin-infested rooms, waiting desperately to receive care. Psychologically traumatized soldiers, including some with severe cognitive and memory problems, were forced to navigate the large complex with little assistance from staff, and many patients accused the

federal government of systematic neglect—a complaint echoed by disabled veterans at military hospitals and treatment centers across the United States.

In the wake of the Walter Reed scandal, the U.S. military and the VA have taken substantial steps toward eliminating bureaucratic red tape and fostering a culture of responsibility among those charged with disabled veterans' care. Today, most disabled service personnel can expect top-notch care at every step in the treatment process—from the moment of injury to the transition to civilian life. Nevertheless, there is little to suggest that military physicians and scientists will be able to eliminate disability from the calculus of American war making in the near future. Even in an age of “virtual warfare,” the military continues to place thousands of troops in harm's way on a daily basis. More important, because disability is as much a product of social environment as physical and psychological trauma, neither technical advancements nor rehabilitation programs can ever fully eliminate the hardships long associated with permanent bodily impairment. In the end, the only way to solve the problem of service-connected disability is to abandon war as we know it.

DISCHARGE AND SEPARATION

The Department of Defense defines *separation* as a general term, “discharge, release from active duty, release from custody and control of the armed forces, transfer to the Individual Ready Reserve, and similar changes in active or reserve status.” Thus, “separated” individuals may or may not be completely relieved of their service obligations—they may still be placed in a reserve status and recalled to duty if they are separated for administrative reasons before they have completed the terms of their original enlistment contract.

Discharge, as a subset of separation, is more final. The Department of Defense defines it as “complete separation from all military status gained through enlistment or induction.” Note that *retirement* is different from *separation* or *discharge* as discussed in this entry.

All separating service members receive counseling from their service's Transition Assistance Program at least 90 days prior to their departure to advise them of the myriad programs available to help ease the transition to civilian life. A “Pre-separation Counseling Checklist” attempts to ensure that this counseling is thorough. Legislation requires placement of this checklist in all personnel records.

Separations may be voluntary or involuntary, administrative or punitive. Reasons for separation of enlisted personnel as outlined in Department of Defense documents governing the process include the following:

1. Expiration of service obligation
2. Selected changes in service obligation
3. Convenience of the government
4. Disability
5. Defective enlistments and inductions
6. Entry-level performance and conduct
7. Unsatisfactory performance
8. Drug abuse rehabilitation failure
9. Alcohol abuse rehabilitation failure
10. Misconduct

11. Separation in lieu of trial by courts-martial
12. Security
13. Unsatisfactory participation in Ready Reserve
14. Secretarial Plenary Authority
15. Reasons established by military departments
16. Weight control failure

Reasons for separation of commissioned officers include the following:

1. Substandard performance of duty
2. Acts of misconduct or moral or professional dereliction
3. Retention is inconsistent with the interests of national security
4. Separation in cases involving extensive confinement
5. Multiple reasons

Both of these lists are, of course, subject to change. Homosexuality, for example, recently ceased to be a reason for involuntary discharge with the repeal of the “Don’t Ask, Don’t Tell” policy implemented under President Bill Clinton. The Don’t Ask, Don’t Tell law, formally known as Title 10 of the U.S. Code, Section 654, was established in 1993. It allowed gay men and women to serve in the military provided they concealed their sexual orientation. On December 22, 2010, President Barack Obama signed legislation that set conditions for the repeal of Don’t Ask, Don’t Tell. All active-duty, selected reserve, and civilians who supervised military personnel received training before the law was officially repealed effective from September 20, 2011.

Again, separations/discharges are, for the most part, categorized as administrative or punitive. Administrative separations/discharges are generally characterized in the three following ways:

1. *Honorable*: The service member’s career met the standards of acceptable conduct and performance of duty for military personnel.
2. *General (Under Honorable Circumstances)*: The service member’s career was “honest and faithful”; however, the negative aspects of the individual’s performance outweigh the positive.
3. *Under Other Than Honorable Circumstances*: The service member separated based on a

pattern of undesirable behaviors, for example, habitual abuse of power or endangering the welfare of others.

Remember that individuals being separated with honorable or general characterizations may in some circumstances still be recalled to duty.

There are circumstances in which a service member is completely released of any obligation to the military *without* receiving one of the above three classifications. This is known as an “uncharacterized separation.” These uncharacterized separations include entry-level separations (those initiated while a service member is still in the first 180 days of service, also known as “trainee discharges”); voided enlistments or inductions (e.g., for those found to be younger than 17 years; those who are insane, intoxicated, or otherwise impaired at time of enlistment; or those found to be a deserter from another service); or separation by being dropped from the roles of the service (a sort of catchall for all other uncharacterized separations).

Punitive separations are discharges levied after conviction by the courts-martial (the military judicial system). They are characterized in the three following ways:

1. *Bad conduct (enlisted personnel)*: A service member receives this type of discharge as punishment for bad conduct rather than as a punishment for more serious offenses of either a civil or military nature. This characterization is less severe than a dishonorable discharge.
2. *Dishonorable (enlisted personnel)*: A service member receives this, the most severe punitive discharge, after having been convicted of offenses usually recognized by the civil law as felonies or of some other military offenses requiring severe punishment.
3. *Dismissal (commissioned officers only)*: Officers receive dismissals after being convicted of offenses usually recognized by the civil law as felonies or of some other military offenses requiring severe punishment.

“Other than honorable” administrative discharges and all punitive discharges result in the loss of some or all Veterans Affairs benefits and veterans’ civilian employment preference, under which veterans receive priority placement over nonveterans in

federal and other civil service jobs. Furthermore, civilian employers will often request a copy of a veteran's DD 214, or "Certificate of Release or Discharge from Active Duty." This document provides a complete overview of one's military service, to include length of service, a chronology of significant personnel actions, documentation of foreign service, an accounting of awards and education, characterization of service, and reason for separation. Providing the DD 214 can prove problematic for individuals who wish to cite their military service but received an "other than honorable" administrative discharge or any punitive discharge. Individuals can complete DD Form 0293, the "Application for the Review of Discharge from the Armed Forces of the United States," should they want to apply for a change in the characterization or reason for military discharge issued to them in an attempt to clear their name or regain veterans' benefits.

DIVERSITY

The U.S. Department of Defense (DOD) defines *diversity* as "the different characteristics and attributes of individuals" and *diversity management* as "the plans made and programs undertaken to identify in the aggregate the diversity within the Department of Defense to enhance DOD capabilities and achieve mission readiness." This entry discusses the types of diversity—nationality/ethnic group, racial, religious, gender, and sexual orientation—among U.S. troops from the American Revolution to the present and looks at the continuing commitment of the U.S. military to embrace diversity.

Diversity and the Early 19th-Century Army

Diversity is now viewed by military and civilian officials as essential to maximizing the effectiveness of today's all-volunteer armed forces, but diversity has not always been viewed as a positive attribute. For much of American history, military officials strived to keep the armed forces as White as possible and resisted attempts to allow other groups to serve. At least 5,000 African Americans served in the American Revolution, for example, but Blacks were barred from the militia in 1792 and from the army in 1820, when service was restricted to free White males between the ages of 18 and 35 years.

Military service was characterized by poor pay and living conditions and little chance for advancement, and few White Americans volunteered for service. Therefore, the military depended on significant numbers of immigrants, primarily German, Irish, and English, to fill the ranks. Despite periodic attempts to limit or ban foreign enlistees, the percentage of immigrants in the army continued to rise steadily until the Civil War. From June 1821 until the end of 1823, approximately, 25% of army enlistees were foreign-born, and in 1836–1837, it was nearly 40%. In 1852–1853, 3,516 of the 5,000 men recruited for the army, or roughly 70% of the total, were foreign-born: 2,113 came from Ireland, 678 from Germany,

306 from England, 126 from Scotland, and 293 from various other European countries.

The changing ethnic nature of the nation, and of the military, became apparent during the Mexican War, 1846–1848, when numerous Irish Catholic immigrants joined the army. In recognition of this, President James K. Polk, with the aid of Archbishop John Hughes of New York, appointed two Jesuit priests, John McElroy and Anthony Rey, as the first Catholic chaplains in the U.S. Army. Indeed, in January 1847, Rey became the first Catholic chaplain to die in service.

The Civil War

During the Civil War, more than 516,000 immigrants, accounting for nearly 24% of Union manpower, volunteered for service. German immigrants were most numerous, with more than 200,000 serving in the Union armies, followed by the Irish with more than 150,000. There were also significant numbers of Italians and Scandinavians. Many immigrants and first-generation Americans served in ethnically cohesive units, such as the famous Meagher's Irish brigade, or the 39th New York Infantry, known as the Garibaldi Guard, and composed largely of Italian Americans from New York City. The 9th Ohio, 9th Wisconsin, and 74th Pennsylvania regiments, to name just a few examples, were made up entirely of German Americans. Though there were Irish, Germans, and Italians in their ranks, the Confederate armies did not have the same ethnic diversity as did the Northern forces, with most rebel soldiers claiming British ancestry. There are only 19 Scandinavians known to have served in the Confederate army, for example.

There was religious diversity as well. Though the vast majority of soldiers on both sides were Protestant, there were hundreds of thousands of Catholics and an estimated 10,000 Jews serving in the war—about 7,000 in Union forces. This diversity was represented among the Civil War chaplains, though somewhat unevenly. Approximately 3,000 chaplains administered to Union forces and somewhere between 600 and 1,000 to the Southern armies. The vast majority were from Protestant denominations. There were more than 500 Methodist and 300 Episcopalian chaplains in the Union army, for example, but only 40 Catholic priests. In 1862, the war did see the appointment of

the first Jewish and African American chaplains in the Union Army as well.

The presence of Black chaplains attested to the racial diversity of the federal forces. In July 1862, Congress lifted the ban on Black enlistments, and eventually more than 186,000 African Americans served in the Union Army and another 30,000 in the navy. African Americans in the navy served in integrated crews, but the Black soldiers, the U.S. Colored Troops and those in state units like the 54th Massachusetts, served in segregated units, under White officers. About 36,000 African Americans died in the war, but they provided invaluable manpower for the North. Though individual African Americans fought for the South, the Confederacy never raised any Black combat units.

Native Americans, however, served in relatively large numbers on both sides during the Civil War, building on a tradition of Indian service in some capacity in the military since the American Revolution. Oneida and Tuscarora warriors fought with General Horatio Gates's forces at Saratoga in 1777. More than 1,000 Native Americans, mostly Creeks, Cherokees, and Choctaws, served in approximately 100 organized units during the War of 1812. There were also units of Chickasaw, Shawano, and Creek Indians serving under Andrew Jackson in the Creek Indian War of 1813–1814. From 1815 until 1846, Indian allies fought with the army against other Native American tribes, most notably, the Choctaw and Creek in the First and Second Seminole Wars in 1817–1818 and 1836–1842. The Menominee and Potawatomi served alongside the army in the 1832 Black Hawk War, and in 1836, Creek Indians loyal to the U.S. government fought their own kinsmen in the Creek War. At least one company of Indians fought in the Mexican War.

Initially, the Confederate states managed to raise four regiments of Cherokee, Creek, Chickasaw, and Seminole from the Indian Territory (Oklahoma) in 1861. The U.S. Army would manage to win back the bulk of these tribes over the course of the Civil War, and approximately, 3,600 Cherokee, Creek, Chickasaw, and Seminole served in the Union Army organized into three regiments. For the Cherokee, it was a true Civil War with members of that nation serving on both sides of the conflict. Individual Native Americans also served in regular formations in both armies.

The Civil War also saw the first known Asian Americans to serve. There were not many—only

50 or so in the army and another 36 in the navy have been identified. Most were Chinese Americans, often the sons of sea captains or missionaries.

The Post–Civil War Army

After the Civil War, Congress reduced the size of the army to prewar levels, averaging between 16,000 and 24,000 men for the next three decades. The army, however, did retain much of its diversity. The ranks were once again filled with immigrants, primarily German and Irish. Service in the Civil War had won a permanent place in the army for African Americans in the form of two infantry and two cavalry regiments. The military still used and depended on Indian scouts in their wars against Plains and Southwest Native American nations, and they even accompanied General J. Pershing into Mexico in 1916; the Indian Scouts were not officially disbanded until 1947.

World War I

During World War I, the government celebrated ethnic and racial diversity and used it to help fuel support for the war effort among various groups. The New York 77th or “Melting Pot” Division, for example, composed of recruits with Italian, Jewish, and other immigrant backgrounds, was highly publicized by authorities to attract more ethnic support for the war. More than 367,000 African Americans served in the war. The vast majority were in service and supply units, but two all-Black combat divisions, the 92nd and the 93rd, were raised and saw action on the Western Front. The Great War also saw the first time African American men were trained in large numbers as commissioned officers. All of the senior and staff officers of the Black divisions were White, but the company grade officers were largely African Americans; most of them graduates of Camp Des Moines, the first Black officers' training camp in American history.

More than 12,000 Native Americans served in World War I. There was no deliberate attempt to concentrate them in all-Indian units, but because many were federalized National Guard units, such as the 36th Texas-Oklahoma National Guard Division, this was often the case. The 142nd Infantry Regiment, for example, contained more than 600 Native Americans in its ranks.

Diversity paid dividends for the American Expeditionary Force in Europe. The use of Navajo “code talkers,” relaying tactical information and intelligence in an “unbreakable” code based on their native language in World War II, has been highly publicized, but the practice actually began in World War I. The 142nd had a staff of 18 Choctaw Indians relaying messages, and other units employed Cheyenne, Comanche, Cherokee, Osage, and Lakota Indians in the same capacity.

Gender diversity in the armed forces would also occur in World War I. For the first time in history, the U.S. Navy and Marine Corps began recruiting women, and more than 13,000 would eventually serve, most of them in clerical duties, but in uniform and as official members of the service. The army also employed women; they, too, were in uniform but considered were civilian employees, and it would take decades before their service was fully recognized. By the end of the war, more than 25,000 American women had served in Europe.

World War II

During World War II, the government in conjunction with the entertainment and publishing industries again sought to promote diversity in the military as a means of promoting the war, and distinguishing the U.S. ideologically from its enemies. *Life* magazine and other popular journals ran stories praising women and minority personnel in the military. The diversity the military and private sector did the most to promote, however, was the belief that most military units and ships' crews were microcosms of American society—various ethnic groups thrown together but working toward a common cause. Hollywood helped with its portrayal of the typical “All-American Unit,” in war movies, which generally featured a cross section of American cultural and religious diversity. The ethnic groups celebrated were all White—from Jewish and Italian Americans from New York to the ubiquitous Texan. The reality, however, was that most minorities would serve in segregated units.

During World War II, President Franklin Roosevelt and Army Chief of Staff General George Marshall pursued an official policy of maintaining racial segregation in the military but providing increased opportunities for minorities. The Selective

Service Act of 1940 prohibited discrimination based on race or color, and in 1942, the president ordered the previously all-White Marine Corps to begin accepting Black recruits and the navy to allow minorities to serve as more than just cooks and stewards. There were Black pilots in the U.S. Army Air Forces, Black tankers in General George S. Patton's army, and an all-Black combat division, the 92nd, in the European theater of operations.

More than 20,000 Japanese Americans served in World War II, and they also fought in segregated units, the most famous being the highly decorated 442 Regimental Combat Team, which saw service in the European theater of operations. American policy generally prohibited posting Japanese Americans to the Pacific theater, so with few exceptions, most did their wartime service stateside or in Europe.

American racial policies were not absolute, and members of some ethnic groups were not segregated. It has been estimated that more than 75% of the 20,000 Chinese Americans who served in the war did so in integrated units. More than 44,000 Indians served in integrated units, but often in formations with substantial numbers of other Native Americans. They served with distinction in both major theaters of operation, in a wide range of Military Occupational Specialties, but as in World War I, many were employed as code talkers. The Navajo code talkers used by the army and Marine Corps in the Pacific theater are the most famous, but Indians from several nations were employed in this capacity in the European theater of operations as well. The 4th Infantry Division in Europe had Comanche code talkers, for example.

World War II saw expanded opportunities for women in the military, though the army initially fiercely resisted inducting women. In 1942, the army agreed to the creation of the Women's Army Auxiliary Corps, which allowed women to serve alongside the army, as auxiliaries, but not quite full members of the service. It was not until July 1943, and with considerable support from Army Chief of Staff General George Marshall, that women were officially inducted as members of the army in the Women's Army Corps. More than 150,000 women would serve in the Women's Army Corps in a wide variety of noncombat occupations, though most were involved with clerical or communications work. Women could serve as full members of the

U.S. Navy as well. In August 1942, the navy activated the Women Accepted for Volunteer Emergency Service. More than 84,000 women served in the Women Accepted for Volunteer Emergency Service, 8,000 as officers.

Post-World War II: The Military Embraces Diversity

Two events occurred in 1948 that would help ensure a more diverse military. In July, President Harry Truman issued Executive Order 9981, mandating fair and equal treatment and opportunity regardless of race for all in the military, effectively ending segregation in the armed forces. Women also became a permanent part of the military that year with the passage of the Women's Armed Services Integration Act.

After initially resisting, military authorities embraced integration and equal opportunity—for males—seeing it as a valuable tool in increasing military efficiency and as an excellent Cold War propaganda. By the beginning of direct American involvement in Vietnam, the military was probably the most integrated and diverse institution in the United States. During the war in 1969, Secretary of Defense Melvin R. Laird established the Domestic Action Council and empowered it to develop race relations programs for implementation throughout the armed forces. That same year, the DOD issued the first Human Goals Charter for Military and Civilian Personnel. The charter committed the Pentagon to providing equal opportunity and advancement based on ability to all Defense Department personnel regardless of race, creed, or color. The charter has been renewed and expanded by every secretary of defense since.

The All-Volunteer Armed Forces

Initially, diversity, like integration, was imposed on the military largely for civilian, political, and cultural reasons and was not viewed by military authorities as enhancing their martial capabilities. This changed with the advent of the all-volunteer armed forces after the Vietnam War ended in 1973. No longer able to make up manpower shortages through the draft, the military needed to appeal to a wide array of civilians to sustain their force levels and attract enough recruits with the necessary skills and education.

The unpopularity of the draft and of the Vietnam War had led to a sharp decline in the number of minorities either enlisting or reenlisting in the military, and racial friction and violence had convinced African Americans, in particular, that the military was in fact no better than civilian society. But a variety of factors, including high civilian unemployment rates, the end of the war, and racial reform within the military once again made military service attractive. Critics were soon arguing that it was too attractive and that minorities were enlisting in disproportionate numbers. By 1983, African Americans composed 33% of the army's enlisted strength, 22% of the Marine Corps, 14% of the air force, and 12% of the navy.

Women became another major source of recruits for the all-volunteer armed forces. Roughly 265,000 served in uniform during the Vietnam War years, but they never made up more than a fraction of the armed forces' enlisted strength. But in 1967, President Lyndon Johnson signed legislation that abolished the 2% limit of women in the armed forces and eliminated remaining promotional barriers. By 1983, women made up nearly 10% of the army's enlisted strength. Today, more than 200,000 women account for 15% of the military's strength. Black women in particular proved to be a valuable source of new recruits into the all-volunteer armed forces. By 1983, they accounted for 20% of the enlisted women in both the army and the air force, 23% of the female strength of the marines, and 18% of the navy's.

According to the Defense Manpower Data Center in 2010, males accounted for approximately 86% and women 14% of the total enlisted strength of the armed forces. Women, however, were 16% of the officer corps. White and African American males at 62% and nearly 18%, respectively, make up the bulk of U.S. defense forces, with Latinos accounting for 12% and Americans of Asian and Pacific Islander heritage accounting for 4%. African Americans and Latinos were underrepresented in the officer corps: White males accounted for 77% of all officers, with 8% African American and 5% Latino. The numbers for both officers and enlisted vary according to service branch.

Sexual Orientation and Don't Ask, Don't Tell

Sexual orientation in the military has been far more difficult to track than ethnicity. For much

of American military history, homosexuals have been actively persecuted and discharged from the military. In 1993, Congress adopted and the armed forces implemented a policy of "Don't Ask, Don't Tell" (DADT) with regard to gays in the military, under which the Pentagon could not ask military personnel their sexual orientation but would discharge gays if their orientation became known. Between 1997 and 2007, nearly 10,500 service members were separated from the military under this policy—the majority occurring before the terrorist attacks of September 11, 2001. DADT was always controversial and never satisfied either supporters or opponents of gays in the military. In December 2010, despite Republican-led filibusters in the Senate, both houses of Congress voted to repeal DADT. President Barack Obama signed the bill on December 22, and DADT was officially terminated on September 20, 2011.

Military Success in Retention

The armed forces not only proved adept at attracting women and minorities to the military, they also proved relatively successful in retaining them. There were several reasons. The armed forces may inherently avoid social and cultural change whenever possible, denying their role as a "social laboratory," but they are also very pragmatic institutions, and they needed recruits. The need for volunteers can often lead to innovation and embracing ideas that were once anathema to the chain of command. Days after the repeal of DADT, marine recruiters were canvassing a gay community center in downtown Tulsa, Oklahoma, for possible recruits.

Most important, all of the uniformed services embraced affirmative action so successfully that they once again became a model for civilian society to emulate. Military officials were also so shocked by the racial animosity and violence that characterized the military in the later years of the Vietnam War that they made equal opportunity and the elimination of racism key priorities for the postwar armed forces. They maintained high standards in recruiting and training, clearly articulated the military's policies and goals to its personnel, and demonstrated that they were serious about diversity and had the power to reward those who complied and punish those who did not. The DOD and all of the service branches created numerous programs designed to help women

and minorities take advantage of opportunities to rise through the system. The military raised recruiting standards and emphasized educational opportunities over monetary bonuses. By the mid-1990s, 99% of Black and 97% of White army-enlisted personnel were high school graduates. Enlistees lacking a high school diploma or wishing to further their education could attend army development academies for economically disadvantaged recruits.

Women and minorities were now part of the command structure, though their numbers were still disproportionately less than in civilian society. Women had been commissioned as officers through officer candidate schools since World War II, but it was not until 1975 that women were finally allowed to attend the Service Academies, and in 1980, 217 out of the 327 women who initially began, graduated from West Point. By 1995, women made up 11.5% of the Army's officer corps and 13.3% in 2009. By 1989, African Americans made up slightly more than 6% of the officer corps. The army with 10.6% had the highest number of Black officers, the air force and marines both with around 5%, and the navy the lowest with 3.6%. That year, Colin Powell became the first African American to hold the position of chairman of the Joint Chiefs of Staff.

Like Powell, many women and minorities were in senior positions. At the beginning of the 21st century, the secretary of the army, Louis Caldera, was of Latino heritage; Al Maldon, assistant secretary of defense for manpower, was African American as was the commander, U.S. Army Forces Command, General Larry Ellis. The chief of staff of the army, General Eric Shinseki, was of Japanese American ancestry. The navy's first Black full admiral, J. Paul Reason, had just retired and stepped down as commander of the Atlantic Fleet. In 2001, Coral Wong Pietsch became the first Asian American woman to hold the rank of brigadier general in the U.S. Army, and there were nine Black admirals, including one woman, in the navy. In 2007, General William E. "Kip" Ward assumed command of the new U.S. Africa Command, and the following year, General Ann E. Dunwoody became not only the first female four-star general of the United States but also the first to hold a major army command as commanding officer of the Army Materiel Command. Success, however, is still limited, and women and minorities are still underrepresented throughout the officer corps and especially in the senior ranks.

Religious Diversity

Tracking the religious diversity of members of the armed forces is more difficult than establishing race or gender, because disclosure is not mandatory. About 70% of military personnel self-identify as Christian. The majority of military personnel are Protestant, but the largest single denomination, with 284,000 adherents, is Roman Catholicism; "no preference" is the next most popular response. The DOD estimates that there are about 4,000 Muslims and a similar number of Jews in the military.

There were 3,045 chaplains in the military in 2011, and 90% of them were Christians. Most were from a Protestant denomination, but the military has become more sensitive to the various religious and cultural needs of its personnel. The army brought Rabbinical chaplains in for holidays for Jews serving in Iraq, for example, and has expanded the number of rabbis and Muslim imams available. In 1999, there were two Muslim chaplains for the army and two in the navy. A year earlier, the first permanent Islamic mosque, the Masjid al Da'wah, opened at Norfolk Navy Base in Virginia. Within 4 years, there were a dozen Muslim chaplains serving the needs of Muslims in the armed forces. There is also now a Buddhist chaplain, and the military is exploring adding Hindu and even possibly Wiccan chaplains. A more problematical group is the atheists. There are currently several chapters of Military Atheists and Secular Humanists, and they are seeking their own representation among the chaplain corps.

Though problems have emerged, particularly of sexual harassment of female military personnel, the military has been relatively successful in keeping racial and gender friction to a minimum, and there have been no large-scale racial problems such as what plagued the military in Vietnam. A 2006 Pentagon study found that while three fourths of minority personnel reported experiencing some form of racist behavior, it was generally in the form of racist jokes or disparaging remarks. In 2009, a leading Muslim veterans' affairs organization claimed that it had received no complaints of religious harassment from Muslims in the armed forces.

Women and Diversity

Last but not least, the military has removed substantial barriers to women in the armed forces. In many respects, the turning point for women was the

1991 Persian Gulf War in which more than 40,000 women served. Congress that year allowed women to serve in combat aircraft in the air force and navy and repealed restrictions on women on navy combat vessels 2 years later. By 1994, 92% of the Military Occupational Specialties in the military were technically open to women. The air force and the navy allow women to serve in combat with few restrictions, and in January 2013 Secretary of Defense Leon Panetta formally announced the end of the Combat Exclusion Policy, legalizing female service in frontline combat units. Even before this development, however, many women saw their share of combat and casualties. Thirteen U.S. servicewomen were killed in the 1991 Persian Gulf War, 21 were wounded, and 2 became prisoners of war. From 2001 to 2008, more than 220,000 women served in Iraq, suffering 104 killed and more than 600 wounded.

Continuing Commitment to Diversity

In 2008, the DOD directed the RAND Corporation to prepare a study helping them develop “a strategic plan to accelerate its effort to achieve greater diversity among its active duty and civilian leadership.” The RAND study was part of the current emphasis on diversity at the highest levels throughout the military establishment. In recent years, the DOD and every service branch have reorganized and expanded their Diversity Affairs organizations at their most senior levels. The air force developed its Equal Opportunity Office and the Strategic Diversity Integration Office, and in 2004, the navy established the Navy Diversity Directorate to coordinate and increase its diversity efforts. In 2006, the army created the Army Diversity Office and launched its Diversity Task Force the following year. The Defense Department in 2009 announced the formation of a 22-member Military Leadership Diversity Commission to evaluate and assess its equal opportunity and diversity policies.

DIVISION

A division is a military formation normally consisting of 10,000 to 15,000 soldiers and commanded by a major general. For most of the 20th century,

divisions served as the smallest combined arms unit capable of independent operations with a variety of combat and service support forces. In most armies, divisions were composed of several regiments or brigades, and in turn, several divisions formed a corps. This entry discusses the history of divisions in the U.S. military, and the makeup, organization, and reorganization of divisions in the U.S. Army and Marine Corps.

Early History

Divisions have constituted a significant type of military organization in the West since the mid-1700s. The idea originated with the Royal French Army to divide a field army into self-contained “divisions,” which, for a limited time, could both march and fight independently. The French marshal de Broglie experimented with divisions composed of several brigades in the Seven Years’ War.

General George Washington ordered the army at Boston to be organized into three divisions of two brigades on July 22, 1775. While initially organized as administrative general officer commands, both divisions and brigades, composed of several habitually assigned infantry regiments and an artillery battery, evolved into semipermanent tactical organizations capable of operating jointly or separately. As the war progressed, Washington maneuvered the divisions independently to conduct operations away from the main army.

The U.S. Army continued to use divisions as a wartime formation during the 19th century. The army employed ad hoc divisions during both the War of 1812 and the Mexican-American War. Influenced by Napoleonic tactics, during the American Civil War, both sides employed divisions as the intermediate tactical headquarters between brigade and corps.

Following the hasty organization and deployment for the War with Spain, the army created its first peacetime combined arms division, the “Maneuver Division,” in March 1911. However, it was not until June 8, 1917, that the army formed its first permanent division, the 1st Expeditionary Division (later the 1st Infantry Division). During World War I, the U.S. Army designed its “square divisions” for sustained battle with some 28,000 men assigned. Forty-three Infantry Divisions served in Europe during World War I, including the 2nd Division with a Marine Brigade.

World War II and Korean War

During World War II, the United States fielded an array of divisions. The army employed 66 “triangular” infantry divisions, composed of three infantry regiments and nine infantry battalions, as a lean but standardized building block of more than 14,000 organic or permanently assigned personnel for global war in both European and Pacific theaters. Sixteen Armored, five Airborne, one Mountain, and one Cavalry Division (serving dismounted) rounded out the U.S. Army’s combat divisions. By 1944, 14 of the Armored Divisions were flexible organizations of almost 11,000 men with three each tank, armored infantry, and self-propelled artillery battalions organized under three combat commands. In the Pacific, the U.S. Marine Corps also provided six large divisions of more than 20,000 men designed as the ground combat element of Marine Air Ground Teams for amphibious operations.

Based on lessons learned in World War II, the army reorganized its infantry divisions for the Korean War. While the divisional structure retained three infantry regiments, the eight infantry divisions that fought were larger at approximately 19,000 and included an organic tank battalion. After Korea, the army flirted with a radical redesign for nuclear war, the Pentomic Division. This structure reduced the size of infantry divisions back to 14,000 men, replaced the previous structure with five battle groups of five rifle companies each, but added organic nuclear-capable artillery and an aviation company.

By the early 1960s, the army restored flexibility by returning to a more traditional design with the Reorganization Objective Army Division, employing three brigades as the intermediate echelon between a variable number of infantry, mechanized infantry, and tank battalions, and the division headquarters. Reorganization Objective Army Division had a fixed base that included Division Artillery, Division Support Command, and a combat aviation battalion. The U.S. Army fought the Vietnam War with five Reorganization Objective Army Divisions Infantry and two Airmobile Divisions. The Airmobile Division was developed based on results of the 1962 Howze Board to provide more than 400 helicopters in an aviation group to provide mobility, fire support, and reconnaissance to the infantry battalions.

Following Vietnam, the army briefly experimented by reorganizing the 1st Cavalry Division

as a Triple Capability Division. This unit had one armored brigade, one airmobile brigade, and one air combat cavalry brigade. By 1975, however, it was converted to a standard armored division. During the 1980s, the army added the Light Infantry Division as a new design at just over 10,000 personnel for a more strategically mobile variant of the “heavy” division of nearly 20,000 authorized personnel.

The Post–Cold War Era

Between Operation Desert Storm in 1991 and Operation Iraqi Freedom in 2003, divisions remained the army’s basic combined arms building block, with standardized units capable of being tailored in accordance with operational conditions. Divisions primarily conducted tactical operations and were intended to be self-sustaining. Corps normally controlled two to five divisions of any type and combination. Ten Regular Army and eight National Guard divisions (armored, mechanized infantry, light infantry, airborne, and air assault)

existed in the U.S. Army force structure prior to 2003, each type with its own unique capabilities and limitations.

Marine divisions have remained structurally unchanged since World War II. Larger than their army counterparts at approximately 20,000, they have retained their traditional three infantry regiments, an artillery regiment, and other divisional support troops. During operations, the three active Marine divisions normally serve as the ground combat element for a Marine Expeditionary Force, contain no organic aircraft, and are dependent on the Marine logistics group for service support.

Beginning in 2003, to gain operational flexibility, the U.S. Army reorganized all of its divisions. Under the modular force, divisions lost all of their organic units. Division headquarters became standardized and self-contained units capable of controlling any combination of independent brigade combat teams and support brigades tailored for each specific mission. While divisions have become more capable of performing as joint and multinational task forces like

Figure I Modular Division Menu

a corps, divisions remain the army’s primary tactical headquarters for command and control of brigade combat teams. Employed during Operations Iraqi Freedom and Enduring Freedom, modular divisions have effectively controlled up to nine maneuver brigades and more than 39,000 personnel while conducting counterinsurgency operations (Figure 1).

“DON’T ASK, DON’T TELL”

“Don’t Ask, Don’t Tell” (DADT) was the policy enacted in November 1993 to address gays and lesbians in the U.S. military. Technically, the law is Title 10, section 654, of the U.S. Code “Policy Concerning Homosexuality in the Armed Forces,” but it is commonly referred to as DADT. (Title 10 of the U.S. Code provides the legal framework for all aspects of the military. A subset of Title 10 is the Uniform Code of Military Justice, which regulates the behavior of service members.) DADT represents a policy compromise between President Bill Clinton and a recalcitrant Congress and military leadership. It was supposed to separate out a person’s behavior rather than personality. Specifically, soldiers can be homosexuals so long as they don’t engage in homosexual activity. As often happens with compromises, the end result was worse than what existed before. This entry discusses the evolution of DADT, from its inception to its repeal.

Background

Historically, starting with the American Revolution, homosexual activity within the military has been punishable by separation (usually dishonorable) from the military. In 1916, the Articles of War was the first time sodomy was explicitly deemed a crime under military law, although only in cases of assault. In 1920, consensual sodomy was deemed a crime. Throughout World War II, and due to the massive numbers of soldiers in the military, policies toward homosexuals went through numerous different iterations. Of particular note, by the end of the war, the focus of the regulations excluded soldiers who could be labeled as homosexual, even if they did not engage in said behavior. The Cold War was marked by an even tighter crackdown on homosexual servicemembers, both within the military and the broader government, because it was feared that gays and lesbians were susceptible to blackmail. In the wake of Vietnam and in the shadow of the social and cultural changes within American society, the military changed tactics to exclude gays and lesbians on moral grounds. However, at a commander’s discretion, a soldier could be retained if the soldier had a strong record and was deemed worthy. At the end of President Jimmy Carter’s presidency a new

Department of Defense (DOD) policy was set forth. Specifically, homosexuality was determined to be no longer compatible with military service, and if someone was deemed a homosexual, the person would be discharged. The one caveat to this new policy was that, except in cases of criminal activity, discharges would be honorable. It is against this backdrop that presidential candidate Bill Clinton promised on the 1991 campaign trail that if elected, he would issue an executive order repealing the ban on gays in the military.

The Making of a Compromise

After winning the election, it appeared that Clinton was going to follow through on his promise. However, right from the start, he ran into stiff resistance from Congress and the military leadership. The two most vocal opponents of lifting the ban were chairman of the Joint Chiefs Colin Powell and Georgia Democratic senator Sam Nunn. Nunn, as chair of the very powerful Senate Armed Services Committee, seemed determined to assert his power against Clinton. Powell, Nunn, and others took the debate to the public. This allowed conservative Christian groups that believed that homosexuality is morally wrong to mobilize and bring a cascade of voices against repealing the ban. Under unrelenting pressure, Clinton decided to delay issuing his executive order for 6 months while the issue could be studied. During this time, both the House and Senate held hearings on the issue. Interestingly, throughout the hearings, a new rationale for excluding gay and lesbian service members emerged. During his testimony, Powell agreed that gays and lesbians no longer represented a security threat. However, he and others felt that these service members were a threat to discipline, unit cohesion, and privacy. More important, it was felt that lifting the ban would be a risk to the safety of gay and lesbian service members themselves. Furthermore, during the hearings it was stated, or more appropriately threatened, that if the ban were lifted, there would be a mass exodus from the military. This line of argument had similar rationales as the racial exclusions and discrimination perpetrated against African Americans until the armed forces were desegregated in 1949. Therefore, it was no surprise that the famed military sociologist Charles Moskos was brought in to both testify and consult.

Moskos, who was opposed to lifting the ban, built his career doing research on racial integration within the military. Throughout the hearings, he came up with the initial idea of separating service from actions. Moskos drafted up the outlines of a compromise plan that allowed gays and lesbians to serve so long as they kept quiet about their sexuality. He is also credited with coining the term *Don't Ask, Don't Tell*. Moskos sent the plan to Nunn, who became the sponsor of this plan.

Moskos and sociologist Laura Miller conducted two surveys of enlisted service members throughout 1992. There were some methodological flaws in the sampling; however, 471 men and 470 women were interviewed. The results showed that nearly 80% of men and 40% of women were opposed to ending the ban. The reasons included views on morality, cohesion, effectiveness, discipline, and general fear. Public opinion was even more difficult to judge as surveys by the *Los Angeles Times* and Gallup showed Americans split. As the hearings went on, the Clinton administration was put on the defensive, and Clinton seemed to lose the will to see this through to the end. As a result, he reached out to the military and sought a compromise. Some critics blame Clinton for not taking this step earlier. The compromise, heavily influenced by Nunn, centered on Moskos's "DADT" idea. Thus, on July 19, 1993, Clinton announced the new policy.

The Failures

As with many compromises, there were few winners and plenty of losers. The gay and lesbian community felt betrayed by Clinton, accusing him of letting politics stand in the way of progress. A closer examination shows that the Clinton administration did not give this issue the full attention necessary. Apart from not engaging the military leadership early and often, it did not assign senior policy people to work on the issue. Perhaps more damning was that the RAND Corporation was tasked with studying the issue of gays and lesbians in the military at this same time. Their conclusions found that homosexuality had no real impact on military service. Yet this report was all but ignored by the Clinton administration and Congress. Regardless of how the policy came to being, it was nothing short of an abject failure. Discharges of gays and lesbians doubled between 1994 and 2001. In the aftermath of the attacks on

the United States on September 11, 2001, and given the strain put on the forces with the drawn-out wars in Iraq and Afghanistan, the number of discharges has tapered off. However, there were numerous examples of misapplication or misuse of DADT to rid the military of gays and lesbians. Evidence suggests that DADT made it easier to persecute gays and lesbians in the military.

The Repeal

Supporters who wished to repeal DADT pointed to the experience of foreign militaries. More than 20 of America’s allies allowed gays and lesbians to openly serve without disrupting unit cohesion, including Britain, France, Israel, and Canada. Critics (including Moskos) counter that it is impossible to compare foreign militaries and the U.S. military. They argued that the U.S. military was of different size and scope than other militaries with different societal factors at play. Yet, in light of recent technological

advances that dramatically altered the ways units are formed, the unit cohesion argument held little merit. In fact, that argument came to sound quite similar, and equally as outdated, to those made to prevent African Americans and women from being fully integrated in past decades.

Barack Obama, as part of his 2008 run for president, made the DADT repeal one of his campaign promises. Unfortunately, once elected, President Obama moved slowly toward ending the ban. On taking office, he committed to ending the ban but provided few details on when or how. He rebuffed pressure to end DADT through an executive order, essentially a backdoor legal maneuver. Instead, he chose to force Congress to change the law. Finally, in 2010, with solid Democratic control of Congress, Obama laid out a formal plan for overturning the legislation. The House of Representatives voted 234 to 194, mostly along party lines, to end DADT as part of the Fiscal Year (FY) 2011 National Defense Authorization Act. The House did not directly repeal

Chairman of the Joint Chiefs of Staff Admiral Mike Mullen is applauded during a bill signing ceremony for the Don’t Ask, Don’t Tell Repeal Act of 2010 at the U.S. Department of Interior in Washington, D.C., December 22, 2010. Mullen had endorsed the repeal by stating, “Speaking for myself and myself only, it is my personal belief that allowing gays and lesbians to serve openly would be the right thing to do. No matter how I look at this issue, I cannot escape being troubled by the fact that we have in place a policy which forces young men and women to lie about who they are in order to defend their fellow citizens.”

Source: Official White House photo by Pete Souza.

the policy itself but instead gave some measure of control back to the DOD. The bill asked the DOD to complete a report on the potential impact that repeal of the legislation would have on the military. If the report determined no major issues, then the law would automatically repeal after 60 days. However, the DADT repeal hit significant opposition in the Senate. Senator John McCain (R-AZ) led a filibuster to prevent Senate approval of the FY 2011 National Defense Authorization Act in September 2010.

The prospects for overturning DADT were further dimmed after the November 2010 midcycle elections. Republicans gained control of the House of Representatives and shrank the number of Democrats in the Senate. Taking advantage of the "lame duck" congressional session, in December, Obama and the Congress voted on a stand-alone measure to repeal DADT. The House passed the measure 250 to 175, and the Senate passed it by a margin of 65 to 31. President Obama signed it into law on December 22, 2010. The law charged the DOD with developing a plan for implementing repealing DADT without harming military effectiveness, unit cohesion, and recruiting or retention efforts. Once these conditions were met and approved by the president, DADT would expire after 60 days. The DOD spent the first half of 2011 preparing for the end of DADT, including extensive training. On July 22, 2011, President Obama signed off that the conditions had been met. Two months later, on September 20, 2011, the policy known as DADT expired.

While DADT is no longer a policy, a number of issues have emerged. For example, what should the DOD do with service members who were discharged under the DADT policy? The DOD decided it would allow those discharged under the former law to reapply and rejoin the military. However, it did not offer compensation for those who were discharged under the law. This has led to a series of legal challenges that still require resolution. Other issues include same-sex marriages. Military chaplains were authorized to perform same-sex marriages if it was in line with their religious tenets. Furthermore, same-sex marriages were authorized to take place on military bases. However, both of these provisions were challenged by congressional critics in the FY 2012 National Defense Authorization Act. Also, the House attempted to ban same-sex marriage activities from occurring on military bases and being performed by chaplains. This effort fell short, but it is likely to come up again. Finally, the Senate put forth an amendment to remove the prohibition

of sodomy, Article 125, from the Uniform Code of Military Justice. The sodomy act has unfairly been used as a discharge tactic against homosexual service members over the years. This amendment, seeking to clean up vestiges of antihomosexual laws, ran into some language difficulty. Article 125 also prohibits acts of bestiality, so the removal of the article itself would have created the perception of legalizing bestiality. The authors removed the amendment and plan to resubmit a clearer version in the future.

Ultimately, the decision to allow gays and lesbians to openly serve came when society was ready. The U.S. military is simply a reflection of broader social and cultural norms. Several high-profile gay and lesbian service members, a new generation of service members with greater exposure and tolerance toward gays and lesbians in society, and evidence from the wars in Iraq and Afghanistan suggested that repealing DADT would have little or no negative effect. This also confirmed that DADT was more of a political issue rather than a military one. In fact, the reaction to DADT's repeal has been a collective yawn. In distinct contrast to the early 1990s, the military, the public, and even the lawmakers do not seem nonplussed by the repeal. In nearly all the national polls, approximately three quarters of respondents are supportive of gays and lesbians openly serving in the military. Some conservative presidential candidates attempted to use it as a wedge issue in the 2012 Republican primary, but their efforts received little attention or support. In an era where positively portrayed homosexual characters are common on television shows and in movies and high-profile celebrities announce their sexuality publically all the time, a policy banning gays and lesbians from openly serving in the military not only seems quaint and outdated but also is completely out of sync with the majority of American society.

DRILL AND CEREMONY

The military term *drill and ceremony* refers to two different events that are interrelated and complement each other. The first, *drill*, concerns the methods by which an officer, noncommissioned officer, or other unit commander moves personnel from one place to another in an orderly fashion by the use of verbal commands. The second, *ceremony*, refers to the various ceremonies used by military (U.S. Army, Marine Corps, Navy, Air Force, and Coast Guard) and civilian organizations to promote a unit's esprit de corps, self-esteem, cohesion, and morale. Ceremonies include events such as promotions, changes of command, award presentations, military reviews, retirement of various personnel, and funerals. Drill and ceremony, also known as D&C, most notably applies to military branches, but it also applies to other groups that have a need for precision movement and other ceremonial activities such as marching bands, police departments, and fire departments. This entry examines the history of drill and ceremony and its role in military training today, ceremonies such as honor guards, and military bands.

Drill

Origins

Early military drill instructions were written by the Roman writer Publius Flavius Vegetius Renatus and included in his work *De Re Militari*. A more

famous ancient work *The Art of Warfare*, written by the legendary Chinese general and philosopher Sun-Tzu, has become the most widely read textbook on the conduct of warfare in military history and continues to be read by modern military and business leaders around the world today. Commanders in the Roman army utilized various forms of drill to maneuver and deploy their forces for battle and to also change formations during the fighting. The effective use of weaponry directly evolves from various forms of drill, such as the use of the sword, pikes, loading and firing of firearms, and the loading and firing of artillery. Fought in 480 BCE between a loose coalition of Greek city-states and the Persian army, the Battle of Thermopylae demonstrated how various drill tactics could change the outcome of battle when properly executed. The tactics used in the wars of the 17th, 18th, and 19th centuries were based almost entirely on how proficient military commanders were at maneuvering their respective forces on the battlefield so as to engage and defeat their enemy. During the American Civil War, Union lieutenant colonel Joshua Chamberlain, a college professor from Maine who lacked professional military training, ordered a bayonet charge to repel an attack by Confederate forces at the Battle of Gettysburg. For his troops to execute such a maneuver, they would have first practiced this tactic through repeated drill. In the military forces of the United States, the development and use of various drills and ceremonies date back to the assignment of Friedrich Wilhelm Ludolf Gerhard Augustin von Steuben, more commonly known as Baron von Steuben, to the staff of Major General George Washington.

Friedrich Wilhelm Ludolf Gerhard Augustin Baron von Steuben

On June 14, 1775, the Second Continental Congress authorized the creation of the Continental Army and appointed George Washington as its commander with a commission as a major general. The new commander struggled with transforming the various amateur militia units into a cohesive professional military unit. Even with victories at Boston in 1775 and Saratoga in 1777, the Continental Army had barely avoided annihilation on several occasions during the first 2 years of the Revolutionary War and still lacked the military discipline needed to defeat a veteran, professional army such as that

maintained by the British. In December 1777, Washington moved the Continental Army to Valley Forge, Pennsylvania, to set up winter quarters. In February 1778, Friedrich Wilhelm Baron von Steuben, a Prussian military officer, arrived at Washington's headquarters. Bearing credentials from Benjamin Franklin suggesting to Washington that he might benefit from the officer's military experience, Steuben offered his services to the general. Realizing that his army desperately needed professional military training to defeat the British, Washington took a gamble and assigned Steuben the daunting task of organizing and training the Continental Army.

Aided by Brigadier General Nathanael Greene and Colonel Alexander Hamilton, Steuben immediately went about the task with vigor, beginning the army's transformation by first forming a "drill company" of selected soldiers from the army's fledgling ranks. Since Steuben could not speak English, all verbal commands were given in German, with the aid of a translator. Written commands and instructions were provided in French and then translated. As training progressed, Steuben compiled the first training manual for drill, titled *Regulations for the Order and Discipline of the Troops of the United States*. As Steuben's first group of soldiers became proficient, they were tasked to train other soldiers in the army utilizing the new drill manual and closely supervised by Steuben himself. These soldiers essentially became the first members of what would become the non-commissioned officers' corps, or NCOs. Soldiers learned quickly and became skilled at obeying verbal movement commands, loading and firing their weapons, and using the bayonet. When campaign season arrived in the spring, the ragamuffin army that had gone into winter quarters now emerged as a highly trained, professional fighting force. The modern drill and ceremony duties and training that are conducted by all branches of the United States military are based on those first efforts by Steuben to organize the training of the troops at Valley Forge. Congress formerly adopted the drill manual, nicknamed the "Blue Book," that he developed in 1792, and it has served as the basis for later drill and ceremony manuals that would be developed, including the most recent U.S. Army Field Manual FM 3-21.5, *Drill and Ceremony*.

Leadership and Recruit Training

When used as a military training tool, the conduct of drill and ceremony makes command opportunities available down to lowest ranks. Officers, noncommissioned officers, and other personnel of various ranks all receive training in drill and ceremony during their careers and take turns commanding groups of different sizes. Noncommissioned officers who desire to serve as drill sergeants and drill instructors within each military branch receive extensive training in drill and ceremony at their respective professional schools before they are allowed to train new recruits.

New recruits who arrive at one of the two U.S. Marine Corps Recruit Depots, at Parris Island, South Carolina, or San Diego, California, are introduced to their very first drill movement within seconds of stepping off the recruit bus. The famous "Yellow Footprints," painted on the surface just outside the bus door, are where each of the new recruits, male or female, learns to stand with chest out, chin in, feet planted at an angle of 45°, with thumbs along the seams of the trousers. Much to the chagrin of watchful drill instructors, the recruits rarely get it right the first time, but this is where the repetitive design of drill comes in, with each recruit mastering the skill before moving along to the next. Initial entry training in the U.S. Army, Navy, Air Force, and Coast Guard all introduce drill into the very first days of recruit training. Foreign to most new recruits, terms such as *Right Face*; *Left Face*; *About Face*; *Forward, March*; *To the Rear, March*; *Double Time, March*; and *Halt* all become second nature and become instilled within the recruit. Drill with a weapon involves a completely different set of commands such as *Shoulder, Arms*; *Port, Arms*; and *Stack, Arms*. In addition to the drills that recruits learn individually, Artillery crews learn basic and advanced drills concerning the loading and firing of artillery pieces. Armor crews learn various drills associated with the loading and firing of crew-served weapons on board various armed vehicles and tanks. Gun crews aboard ships in the U.S. Navy learn the drills required to fire the various crew-served defensive and offensive weaponry on board their respective ships.

During initial entry training, recruits who show great promise are placed into leadership positions and allowed to conduct various drills at the squad,

platoon, and company levels. Competitive drill events between military branches allow for personnel to further sharpen their leadership skills by competing against drill teams and individuals in front of their peers and collective leadership.

Ceremony

Origins

Since ancient times, military commanders have used various ceremonies to celebrate victories, display military strength, honor veterans, and bury the deceased. Still in use today by military forces around the world, these ceremonies include events such as promotions, change of command, award presentations, military reviews, retirement of various personnel, and burial honors and rites for deceased veterans. Today, nations from all over the world maintain special military units whose mission is to conduct distinctive ceremonial duties that include honor guards, color guards, drill teams, bands, weapon displays, and flyovers at sporting events by military aircraft.

Reviews, Parades, and Honor Guards

Reviews are ceremonies where members of a military force assemble to allow an incoming commander, military leadership, or other dignitaries to observe the unit. Reviews are usually done either by the movement of the unit in front of the reviewers or the unit remaining stationary while the reviewer passes by on foot or in a vehicle. Reviews were used at Valley Forge as a way to display the progress of the army during training and to instill pride in the soldiers. Parades have long been used to display the strength of an army, to celebrate an important anniversary or historic event, holiday, or to celebrate a significant military victory. In ancient Rome, victorious commanders were given a special parade known as a “triumph.” The commander would enter the city wearing specially selected clothing and riding in a chariot. His victorious legions marched in unison along with captured enemy prisoners and the spoils of war. During the American Civil War, both Union and Confederate soldiers marched off to war in parades. After the war came to a close in 1865, the victorious Union army used a combination of

review and parade ceremonies as it marched down Pennsylvania Avenue before being deactivated.

Selected military units and individuals participated as honor guards in the Continental Army to show discipline and to provide a higher level of protection to the leadership and other assignments. At Arlington National Cemetery in Arlington, Virginia, select soldiers of the U.S. Army 3rd Infantry Regiment ("The Old Guard") serve in the Honor Guard for the Tomb of the Unknowns. All branches of the U.S. DOD have honor guards who are assigned to the burial details for personnel and veterans of the respective branches. Selected personnel from each of the military branches' honor guard units serve in ceremonies that involve the president of the United States or other upper-level government official. In Berlin, soldiers from the Soviet Union served as honor guards at the Soviet War Memorials in Treptower Park and Tiergarten from just after World War II until the mid-1990s, when agreements were made between Germany and Russia that the memorials would be maintained after Russian military forces withdrew.

Bands

Most military forces in the world today make use of military bands, and the armed forces of the United States are no different. The much renowned U.S. Army Band, also known as "Pershing's Own," is a world-class musical organization that provides musical support for military ceremonies involving the United States. Impressed with the European military forces' use of bands during World War I, Allied Expeditionary Force Commander, General John J. Pershing, established the U.S. Army Band in 1922. During World War II, this band served in the North African and European theaters, where it earned a campaign streamer for service during the Rhineland campaign. Military bands also coordinate with color guards for ceremonies that involve the presentation of a nation's flag and playing of its national anthem.

Funeral and Cemetery Duty

The U.S. Army maintains the U.S. Soldiers' and Airmen's Home National Cemetery in Washington, D.C., and Arlington National Cemetery in Arlington, Virginia. Drill and ceremony play an intricate part in the burial process for military veterans and government officials who meet the stringent requirements

for internment at Arlington. The U.S. Army's 3rd Infantry Regiment, more commonly known as "The Old Guard," has the honor and responsibility for providing ceremonial duties during the internment process. Depending on the rank of the veteran, ceremonial duties such as pallbearers, 21-gun salute firing party, playing of taps, burial flag presentation, caisson, band, escort troops, minute guns, gun salute, and the riderless horse may be provided. Specially selected soldiers known as the Honor Guard provide guard duties at the Tomb of the Unknowns at Arlington 24 hours a day, 7 days a week, regardless of weather, with hundreds of visitors attending the famous Changing of the Guard ceremony that takes place every hour from October 1 to March 31 and then every half hour from April 1 to September 30. In addition to meeting strict height, physical fitness, and other selection criteria, candidates must pass a written test, consisting of 100 randomly chosen questions concerning Arlington National Cemetery and Tomb of the Unknowns history, with a 95% or higher score.

Customs and Ceremony Unique to the U.S. Navy

After the Second Continental Congress authorized the creation of the Continental Army in June 1775, it also authorized the creation of the Continental Navy in October 1775. To help protect the captain and his officers on board the new ships that were being commissioned, the Congress also authorized the formation of the Continental Marines on November 10, 1775. Since a navy makes it home on board a ship that sails on the high seas, some interesting and very unique styles of drill and ceremony have developed over the years since its creation. When a new ship is commissioned and given its name, a ceremony typically takes place that involves the breaking of a bottle of wine or champagne on the ship's hull, dubbed "christening," and the ensuing launching of the vessel as it makes its way down its slipway into the water for the first time. As with the commissioning of a new ship, the decommissioning of an old ship also has a ceremony, but to a much more somber degree, and it is also laced with pagentry and parade.

Another customary ceremony for sailors, or other military service members on board, when they cross the equator for the first time is the time-honored "Crossing the Line" ceremony. Personnel who have never crossed the equator before are dubbed

“Pollywogs” until they complete their initiation and become known as “Shellbacks” or “Sons of Neptune.” A more common ceremony that most naval families are familiar with is that of “Manning the Rail,” a ceremony where a ship’s personnel line the rails of a ship to render honors to another ship or port as the vessel passes by. This ceremony is common for a ship as it leaves and returns to its port. Just as Arlington National Cemetery has military personnel assigned for burial ceremonies, ships in the U.S. Navy have details assigned to conduct “Burial at Sea” ceremonies. Burial at Sea has long been a tradition born out of the need to bury those who had died while at sea due to the lack of a morgue to preserve the body.

Conclusion

With roots strengthened by honor and tradition, drill and ceremony has a long and honored tenure within the ranks of all branches of the armed forces of the United States, as well as other civilian governmental institutions where precise movement of personnel and equipment from one place to another, or the need for the conduct of various ceremonies within those institutions exists. From the earliest writings of Publius Flavius Vegetius Renatus in *De Re Militari* to the latest updates in the current military manuals, drill and ceremony has always been an integral part of combat tactics and ceremonial rituals. With the development of the machine gun and improvements made to artillery during World War I, the time-honored tradition of long formations of soldiers, calmly marching toward each other in the face of gunfire, came to an end, and the new principles of “fire and maneuver” were introduced. However, “drill” and its counterpart “ceremony,” today, still play a vital role in teaching recruits discipline, mental toughness, honor, recognition, and tradition.

DRUG INTERDICTION

Traditionally, the U.S. military has not been involved in the enforcement of civil law, but the major exception is in the instance of drug interdiction. Drug interdiction, or the intercepting of illegal drugs before they are sold, became a major federal issue in the 1970s, with the announcement of the War on Drugs, and continues to this day, both domestically and internationally. Military participation in drug interdiction rose dramatically in the 1980s and continues to this day, particularly with regard to intercepting drug smugglers. However, the legality of

using the military in the enforcement of the War on Drugs, as well as questions surrounding the nature of U.S. drug policy and enforcement in general, keep drug interdiction a controversial issue. This entry discusses the history of U.S. federal and military attempts at drug interdiction and the challenges that have faced the United States in the War on Drugs.

Background

The prohibition of drugs in the United States was largely a 20th-century development, and the first federal legislation on narcotics was the 1914 Harrison Narcotics Tax Act. Modern drug interdiction policy began with a small program known as Operation Intercept in 1969, in which Border Patrol agents inspected cars crossing the U.S. border from Mexico, hoping to curb marijuana smuggling.

The major turning point for federal drug enforcement arrived in 1970, with the passage of the Controlled Substances Act, part of the larger Comprehensive Drug Abuse Prevention and Control Act and Richard Nixon's start to the War on Drugs. The Controlled Substances Act was followed by a rash of subsequent legislation aimed at increasing punishments for drug possession while rooting out the drug trade in the United States. A major early step in the War on Drugs was the creation of the Drug Enforcement Administration as part of the Justice Department in 1973.

By the 1980s, the executive branch asserted new authority over the War on Drugs. In 1982, President Ronald Reagan announced the creation of an American foreign policy to aggressively root out the international drug trade. This marked the beginning of heavy use of the military to enforce U.S. drug laws. The 1988 creation of the Office of National Drug Control Policy (ONDCP) gave the executive branch a firmer grip on national drug strategy, and the ONDCP, through its director (known commonly as the Drug Czar), currently sets the national policy regarding drug use and law enforcement work against drug use.

The 1878 Posse Comitatus Act prohibits the use of the U.S. Army or U.S. Air Force in the enforcement of civil law unless specifically authorized by the Constitution or an act of Congress. In the 1980s, there were growing calls by political leaders to use the resources to combat the drug trade. In 1982, Congress lifted some of the restrictions imposed

on the armed forces and permitted the military to maintain and operate equipment on loan to federal law surveillance, train law enforcement agencies, and share information with civilian agencies. Since the 1980s, federal troops and federalized National Guard units have been periodically deployed to the border. Barred from formally arresting individuals violating criminal or civil laws, their role has been to act as observers for the border patrol. Both federal and National Guard units have assisted federal law enforcement officials by aerial surveillance.

Although air and ground surveillance has led to arrests of drug smugglers and the confiscation of illicit goods, there has been significant criticism. Military leaders fear that such deployments serve to divert the armed forces from the crucial mission of preparing to train for and fight major wars against foreign enemies. Outside of the military, critics have questioned the expense of these deployments, especially when National Guard units are federalized. Incidents along the Mexican border, such as when military units have come under hostile fire, have noted the continuing limitations imposed on active-duty service members who lack the power to arrest suspects.

Despite the massive amount of research, funding, enforcement, and public health campaigns, the numbers on the War on Drugs did not look good by the 1990s. In the 25-year period from 1972 to 1997, the number of federal prisoners rose dramatically, the amount of money spent on the issue increased, and while the number of adults self-reporting drug use dropped, the number of teenagers self-reporting drug use rose steeply. Criticism of the methods used by the federal government also became more prominent in the 1990s. The proportion of federal money spent on drug control had become more skewed toward law enforcement and incarceration instead of treatment options, and the number of African Americans being incarcerated for drug crime and suffering from adverse medical effects caused by drugs (especially hospital visits for overdose) remained higher than other ethnic groups, leading to allegations of racial inequity in the enforcement of the War on Drugs.

Current Application

Central and South America are the focal points for many drug interdiction operations, though the use of federal forces against the opium trade in Asia has

increased, particularly in Afghanistan. The Global War on Terrorism has thus in some ways complicated the issue of fighting the drug trade and the process of drug interdiction. A 2009 army posture statement issued in support of the National Guard Counterdrug Program stated, "As the mission continues to expand, the nexus between drugs and terrorism becomes more evident."

The Department of Defense is engaged in the drug interdiction process through several organizations, but the U.S. Coast Guard is currently one of the most effective agents for federal drug interdiction, due to both the high rate of maritime smuggling and the fact that the Coast Guard's status under the Department of Homeland Security grants it greater legality to operate in drug interdiction activities.

The Coast Guard patrols the shipping routes in waters referred to as the "Transit Zone," covering the Gulf of Mexico, the Caribbean, and the eastern Pacific. The Coast Guard has, between 1997 and 2012, seized 806,469 pounds of cocaine and 333,285 pounds of marijuana. However successful these numbers may sound, it is estimated that for the year 2007 alone, only 41.5% of cocaine and 25% of marijuana were intercepted globally.

Use of the National Guard is also key in the ONDCP strategy. One of the biggest problems currently facing the U.S. military in drug interdiction efforts is the ongoing Mexican drug war and concern over brutal cartel violence spilling over the Mexico-U.S. border. In 2006, President George W. Bush deployed National Guard troops to the Mexican border in Operation Jump Start, which lasted until 2008, in an attempt to keep drug smuggling and drug violence out of these states (with support from the U.S. Army South). In 2010, President Barack Obama again sent National Guard troops to the Mexican border.

More recently, the efficacy of the War on Drugs has been questioned publicly, most notably in a 2011 UN committee report that declared that the effort had failed. Efforts to curb the international drug trade have seen relatively little success worldwide, and policy recommendations to the Obama administration have stepped away from the term *War on Drugs* and issued new directives through the ONDCP. While some scholars claim that legalization of drugs would shift the public attention to treatment of addiction, the ONDCP is currently pursuing what it calls a

balanced drug policy to focus on public health concerns as well as the enforcement of drug laws.

Conclusion

While the United Nations and even the White House have acknowledged that the War on Drugs has failed, U.S. drug interdiction policy has, in practice, changed very little in the past two decades. What has changed is the escalation of the use of federal forces in the enforcement of drug policy. Furthermore, the 2010 publication of the Department of Homeland Security's Counternarcotics Doctrine reveals a long-term commitment to the use of the military in drug interdiction. In coming years, the ongoing turmoil in the Mexican drug wars, if it continues at its present rate, will likely continue to result in military intervention on the part of the United States. Thus, the major challenge facing the military and the federal government in drug interdiction policy is the three-pronged task of preventing drug violence from escalating, continuing or improving its interception of smuggled drugs, and emphasizing treatment options for drug abuse instead of prosecution and incarceration.

E

ECONOMY AND NATIONAL DEFENSE

Soldiers and civilians alike have long understood the close connections between economy and military capacity. Although the saying “an army marches on its stomach” is most frequently attributed to Napoleon, the importance of logistical support has been obvious since antiquity. Similarly, the financial underpinnings of armed forces have always concerned astute observers of the military. “The sinews of war,” said Cicero more than 2,000 years ago, “are infinite money.” In American history, certainly, there have often been very close connections between the broader economy and national defense. Although those connections may have become somewhat weaker in recent years than they were in the 20th century, for the foreseeable future soldiers and civilians will still be forced to grapple with difficult problems in the field of the economics of warfare. This entry examines the connection between the U.S. economy and the military.

In the economic and military history of the United States, World War II stands as the critical watershed. Easily the most costly of all American wars (in real terms), it was also the conflict in which the entire national economy was most fully dedicated to the production of military power. From the Revolutionary War through 1945, one can trace a trend of increasing integration between the armed forces and the national economy. After 1945, although the United States has continued year after

year to devote enormous resources to the military, those resources constituted a smaller part of the economy as a whole. Apparently, the age of “total war”—that is, conflict involving all-out mobilizations of national resources—has come and gone, even as the threat of horrifically destructive weapons remains.

Students of economy and national defense in the 21st century need to be aware of the historical specificity of this post–World War II mode of American military economy, in which defense costs are very high in absolute terms but fairly low in relative terms. In addition, there have been several related developments since the late Cold War, all of which are important for our understanding of the connections between the economy and the military and how those have changed over time. These include a continuing shift away from large forces and large production runs, increased industrial concentration in the defense sector, privatization of military services, and a heavy reliance on borrowing (deficit spending) to finance wars.

Historical Background: Up to 1945

For much of the period from the Revolution to World War II, the United States enjoyed what some historians have called “free security.” The Atlantic Ocean, in particular, limited the country’s vulnerability to incursions by European states, which were the most formidable military powers of the day. If not completely free, national security during this era tended to be cheap. During peacetime for much of the 19th century, the United States spent only about 1% of its national economic output (gross domestic

product, or GDP) on the military. Outside of wartime, the country maintained a relatively small and inexpensive military establishment that represented a relatively small economic burden. As late as the 1920s, after the dawn of what some called “total war,” the country was devoting well under 2% of its GDP to the military. Measured against what would come later, this seems like very cheap security indeed—too cheap, some have argued, to have done enough to discourage a second world war.

The remarkably low peacetime military outlays before World War II should not blind us, however, to the importance of the economic burdens of war during these years and their powerful legacies. The foundations of American political development, for example, were shaped by the miserable economic experience of the Revolutionary War. At least before 1781, when Superintendent of Finance Robert Morris succeeded in partially restoring its financial health, the American war economy had been marked by disorganization, as responsibilities shifted back and forth from the wartime national government to the various states. It was also wracked by severe inflation, caused by a heavy reliance on printing new money to pay for the war. In the postwar period, fresh memories of this chaos informed the federalists, who would champion a constitution that would offer the new nation a blueprint for more centralized political authority. Meanwhile, some of the nation’s early partisan divisions came over the question of how to treat war debt.

Among the significant reforms overseen by federalist administrations in the 1790s was the creation of a mixed military economy, in which the nation maintained several government-owned, government-operated (GOGO) factories and shipyards, while relying also on private contractors. By the middle of the 19th century, the combined efforts of the Springfield Armory and private firms had made the United States an international leader in small arms manufacture. Through the Civil War and well into the 20th century, the U.S. Navy Yards and other GOGO military-industrial establishments would continue to supply the armed forces with a significant fraction of the goods they required, especially in peacetime.

During this era, the United States got better at financing wars. During most peacetime years in the 19th century, the military absorbed close to half of all federal outlays. But because these peacetime expenditures were relatively small, they could

normally be covered by the government’s modest income, provided mostly by customs duties. War expenditures required special financial efforts. After the Revolutionary War, the nation was more successful at financing wars by borrowing, supplemented by taxes. During the War of 1812, the country managed to raise an impressive \$25 million in taxes, along with \$45 million in bond sales. The Mexican War itself was financed easily by modest Treasury borrowing and land grants to soldiers, but in its aftermath, as the army attempted to help manage the nation’s giant territorial gains, military outlays jumped. This military spending on the continental empire, combined with the Panic of 1857, meant that on the eve of the Civil War, the nation was already borrowing to finance its deficits.

During the Civil War, when as much as 20% of national economic output (on each side) was absorbed directly by the military effort, Americans experienced new levels of interdependence between the armed forces and the larger economy. In the South, a heavy reliance on imports and high inflation made the economics of the conflict somewhat reminiscent of the Revolutionary War experience. The North, however, was industrially self-sufficient; it succeeded in financing the war with a giant bond-marketing campaign, supplemented by the printing of greenbacks and the nation’s first income tax. The North’s million-man army was provisioned by thousands of private contractors, as well as by the long-standing GOGO plants, which expanded significantly in wartime. By the end of the war, Union soldiers alone had used roughly a million horses and mules, 100 million pounds of coffee, and a billion rounds of small arms ammunition, among other goods and services. In the years that followed the Civil War, financing war debt and funding veterans’ pensions absorbed a giant fraction of federal outlays. But the active military reverted to relative insignificance, economically speaking. As the United States became, by the end of the 19th century, the world’s largest national economy, it continued to record modest defense budgets.

While European states experienced the shock of “total war” in 1914–1918, the United States avoided an all-out economic effort, as well as mass casualties. It also enjoyed a wartime economic boom, thanks in part to its status as a leading supplier of the European combatants. During the less than 2 years in which the United States was actually at war, as it struggled to mobilize more than 4 million men and send half of

them abroad, the United States devoted only a little more than 10% of GDP to its own war effort. More than half of the cost of the war was financed with bond sales; nearly a quarter was covered by taxes, including an unprecedented set of progressive income and corporate taxes with top rates of well over 50%. The rest of the cost of war was covered by increases in the money supply (now managed by the new Federal Reserve System), which contributed to a doubling of prices. By 1918, when American shipbuilders, steel-makers, explosives manufacturers, and other companies were in high gear on war production, there were some new efforts at governmental coordination of the economy. In the case of the railroads, whose management was officially taken over by the government, this oversight was significant. In many other areas, including the work of the War Industries Board on the coordination of resource allocation and price levels, the effects were quite limited and short-lived.

American economic activity in the service of warfare peaked during World War II, which cost six times more than the nation's efforts during World War I. In 1943 and 1944, an entirely unprecedented 40% of GDP was going to the war effort. Many companies, including the leading automobile manufacturers, completely suspended their regular business by early 1942 and began to send 100% of their output to the military. By this time, the United States was easily the most productive national economy in the world; in addition to supplying its own forces of more than 10 million soldiers and sailors, it served as a major exporter of munitions to the United Kingdom and the Soviet Union. Remarkably, this enormous effort saw no significant dip in the living standards of civilians on the home front, many of whom enjoyed the fruits of another wartime economic boom in the form of record-high take-home pay. At the same time, the country managed to cover roughly 43% of the \$320 billion cost of the war with taxes—a larger proportion than in any previous war. This was accomplished via extremely high tax rates on corporations and individuals, modest increases in the money supply, and by extending the income tax to cover more than 40 million households, 10 times more than before the war.

Early Cold War and the Rise of the “Military-Industrial Complex”

After World War II, many Americans agreed that there could not be a return to the bare-bones defense

budgets that had prevailed for much of the country's history before 1940. The record of the 1930s seemed to show that more strength would be required in peacetime to deter potential aggressors. New technologies, including long-range bombers, missiles, and the atomic bomb, might radically reduce the defensive value of the oceans, as well as the time available to gear up for war.

Despite the widespread agreement about the need for a larger American military establishment after World War II, there remained great uncertainty and conflict over how big, and how expensive, it should be. In the late 1940s, the Truman administration called for annual defense outlays of around \$10 billion a year, or about 4% of GDP. This was too low for the Pentagon and the Congress, which passed budgets far bigger than the ones Truman requested. After 1949–1950, which saw the Soviet Union test an atomic bomb, the establishment of the People's Republic of China, and the outbreak of the Korean War, defense spending jumped, along, evidently, with American leaders' expectations about appropriate baseline levels. By the late 1950s, defense spending accounted for roughly 9% of GDP; it exceeded post-World War I outlays, in real terms, by a factor of 30.

Although the early-Cold War era was one in which the military absorbed exceptionally large economic resources, there was in fact a conscious effort during these years to create a smaller, lighter military force. Facing the Soviet Union and China as potential opponents, American leaders recognized that their greatest comparative advantage was now more in technological capability than in raw industrial capacity, population, or territory. This approach would continue into the 21st century. One of its early manifestations, included in the Eisenhower administration's “New Look” policy of the late 1950s, was a reliance on nuclear weapons as a counter to large Soviet conventional forces. By 1958, the North Atlantic Treaty Organization already held approximately 3,500 nuclear weapons. At its peak, the American stockpile would reach 32,000 warheads.

The high levels of military spending during and after World War II meant that preparations for war had bigger effects on the national economy than they had had in the past. Defense spending helped accelerate the development of the far West and the South, which previously had been much less industrialized

than the Northeast and Midwest. Defense dollars also had important effects on research funding in particular industries, including the fast-growing field of electronics and computing. During the 1950s, the Pentagon contributed roughly half of the budgets for research and development at IBM and for transistor research at Bell Laboratories. Meanwhile, the military served as the leading customer of the electronics industry; it also became a major source of funds for research universities.

As big annual defense budgets became the new norm, Pentagon officials, military contractors, and their congressional representatives were increasingly interested in maintaining public spending on weapons programs. This political dynamic was not entirely novel—it had existed to a smaller extent in the naval shipbuilding industry of the 1890s, for example, but it prevailed now to a greater degree than ever before. Among those who worried about the change was President Eisenhower, who used his farewell address in January 1961 to warn Americans of the need to “guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex.” For the next decade, this sort of criticism of the potential costs of the military economy was widespread, especially among observers on the political left. As military spending rose during the Vietnam War, such critics became increasingly vocal. By 1970, Senator William Proxmire, an energetic watchdog of military budgets, felt it necessary to publish a book warning Americans that “military spending in the United States is out of control.”

Unsteady Demilitarization of the American Economy in the Late 20th Century

Although concerns about Pentagon waste would continue well past the Vietnam War, there was an important shift, after that conflict, in the relationship between the military and the national economy. The Vietnam conflict itself had required a remarkably small piece (about 2%) of the national economic pie, which had grown significantly since the end of World War II. After the American withdrawal from Vietnam, there was a clear (if unsteady) decrease in the fraction of national output dedicated to the military. What had been a baseline rate of about 9% of GDP in the early-Cold War years now moved steadily downward, until by the end of the

20th century, it stood at about 3%. Although this would rise slightly after 2001, Americans in the early 21st century still enjoyed relatively modest economic burdens from defense, compared with those paid by their grandparents. This was a change in relative costs, not absolute ones: As the American economy grew, it could provide lots more butter without any significant sacrifice of guns. This was much less true of the Soviet Union, which by the end of the Cold War was devoting well over 10% of GDP to defense, twice as much as the United States.

As military costs became a less significant burden on the national economy as a whole, they also came to represent a significantly smaller fraction of all public spending. Thanks to the aging of the American population and the expansion of social welfare programs in the 1960s, “entitlements” like Social Security and Medicare became, by the end of the 1970s, the biggest items in the federal budget. By the year 2000, defense accounted for less than 20% of federal spending. This was a remarkable change from the early-Cold War years—and indeed, most of American history—when defense was easily the largest expenditure.

Although the absolute level of military spending remained high by most standards after Vietnam, the late 20th century saw several important qualitative changes in the relationship between the military and the economy. One reason for the decline in the relative cost of defense was the shift, after 1973, to a smaller, all-volunteer professional force. By 1998, the active-duty force was about 1.4 million people, down from 3.5 million in 1968. Equally important were substantial Pentagon budget cuts in the 1970s and 1990s, interrupted by the defense buildup during the administrations of President Reagan. The end of the Cold War, naturally, helped push defense outlays lower. In 1998, the Pentagon was spending a third less than it had when Reagan was preparing to leave office, 10 years earlier.

These developments in the late 20th century, combined with the trend toward economic globalization, created hardships for American military industries and their workers. In Congress and the military establishment, there were new fears about the erosion of the “defense industrial base,” which since World War II had supplied the armed forces with superior technology and equipment, translating American economic might into military capacity. Now American economic superiority was fading, as

was the health of military industries. Between 1989 and 1996, an estimated 1.5 million defense jobs disappeared. Especially for aerospace and naval shipbuilding firms, which tended to have little civilian business, the post-Vietnam and post-Cold War cutbacks were difficult; it was not easy to see how these firms could successfully manage the sort of “defense conversion” that many called for after the demise of the Soviet Union.

One result of this state of affairs in the 1990s was a significant economic concentration in the defense sector. It was a decade of mergers, the most important of which included that of Northrop and Grumman in 1994, Martin and Lockheed in 1995, General Dynamics and Bath Iron Works in 1995, and Boeing and McDonnell Douglas and Rockwell in 1996. By 2001, the U.S. defense sector was dominated by just five giants: (1) Lockheed Martin, (2) Boeing, (3) Raytheon, (4) Northrop Grumman, and (5) General Dynamics. (A sixth big player, BAE Systems, was based in the United Kingdom—one more sign of the importance of globalization.) These mergers suddenly concentrated the business of military contracting to unprecedented levels. As late as 1989, the combined defense sales of the 6th- through 10th-largest contractors had been 60% of the sales of the top five. By 1998, the sales of the second five equaled only 20% of those of the top five. During the first decade of the 21st century, there may have been some slight reversal of this development, as smaller upstarts such as General Atomics (a maker of unmanned aircraft) and Force Protection (armored vehicles) gained more orders. However, the defense sector remained much more concentrated than it had been in the past.

New Developments Since September 11, 2001

Although the wars in Iraq and Afghanistan and other military operations since the 9/11 attacks on the United States have pushed up Pentagon spending and caused changes in the organization of the military economy, many recent developments are consistent with the longer run trends that have prevailed since the era of the Vietnam War. These include the privatization of military production and services; a move away from big production runs of heavy weapons in an effort to create faster, networked forces; and the abandonment of efforts to finance wars through current tax receipts.

Although the privatization of the military industry and services has occurred for centuries, the Pentagon has pursued privatization more aggressively since the 1960s. One reason for this was the ascendancy of libertarian economics, which also influenced the shift to an all-volunteer force. During the Vietnam era, one important proponent of privatization was Secretary of Defense Robert McNamara, whose many attempted reforms of the procurement system included the privatization of the production of the army’s main battle tank. Meanwhile, the navy, which had run large GOGO shipyards for decades, came to rely less and less on its own facilities for the production of new ships and submarines. This privatization of the military industry was accompanied by the privatization of military services, a trend that by the end of the 20th century had come to attract public notice. By 2007, there were an estimated 180,000 people—including about 20,000 Americans—employed by private contractors in Iraq in support of the American war effort there. This development was fueled by the increasing popularity of privatization in the broader political economy, as well as the manpower shortages that came with the adoption of the all-volunteer force. As private contractors started to handle more of the job of logistical support, some of them, including Kellogg Brown & Root, entered the ranks of the most prominent firms in the defense sector. So too, by the turn of the century, did private security firms such as Blackwater. Although these security firms were relatively small and accounted for a tiny fraction of military spending, some observers regarded their rise as the sign of an important shift in the practice of American warfighting, which for decades had eschewed the hiring of mercenaries.

As the Cold War came to an end, military planners debated whether the world was on the verge of a new “revolution in military affairs,” comparable to the radical changes in warfighting that in the past had accompanied the rise of new technologies, including aircraft carriers and atomic weapons. Especially after the American success in the 1991 Persian Gulf War, there was a new emphasis on achieving superiority in speed and sensors, as opposed to manpower and heavy weapons systems. In 1995, for example, one influential student of American military procurement, Jacques Gansler, described an ongoing shift from World War II-style “attrition warfare” to a new “information-based warfare” that emphasized speed, agility, surveillance, and communications

networks. Such a change promised to take advantage of U.S. comparative economic strengths and be better suited to confronting post-Cold War enemies. Immediately on taking office in 2001, Secretary of Defense Donald Rumsfeld pushed the military to become smaller and more agile. While this approach seemed to pay dividends on the 21st-century battlefield, developments in Iraq after 2003 suggested that it may have complicated other important military enterprises, including postwar occupation.

One of the consequences of the shift toward what some called network-centric warfare was the acceleration of the post-World War II trend toward smaller military-industrial production runs. During the Iraq War, the navy had only about 280 ships, a third of the size of the fleet in the Eisenhower era. The air force still had nearly 1,000 F-15 and F-16 fighters in its active force, but just 85 of the new state-of-the-art F-22s. Whereas the United States had fought World War II using thousands of relatively cheap bombers, it now had just a handful of B-2s—which cost \$2 billion apiece. As the production of such ultra-expensive weapons systems came in smaller and smaller batches, the Pentagon started to spend more on sensors, robots, communications systems, and weapons with lower unit costs. Among these was the navy's new littoral combat ship (LCS), which was designed to be far lighter, faster, and cheaper than the ships it had ordered in the Cold War era. Another new weapons technology, already important by the time of the Iraq War, was the *unmanned aerial vehicle*, a term used to describe a variety of small, remote-controlled, pilotless aircraft. By 2005–2006, the small “Predator” drones, which cost only about \$4 million each, were flying missions at the rate of 2,000 a year. Such robots, presumably, will become an increasing part of military procurement in the future. However, even by the time of the U.S. withdrawal of combat troops from Iraq, their displacement of more traditional weapons systems was still limited. In the Pentagon's 2011 budget, for instance, the \$4 billion in proposed spending on all unmanned aerial vehicles represented about 2% of all outlays on weapons systems, and about a third as much as the military spent on its new F-35 manned fighter.

In the early 21st century, one of the most remarkable developments in the American approach to the economics of war was the complete abandonment of attempts to cover costs with increased taxes. Whereas special wartime taxes had paid for a large

fraction of the cost of the two World Wars, and close to the entire bill for the Korean War, in the early 21st century, the Congress and the White House chose to cut taxes, even as the nation embarked on a \$1 trillion (plus) war that would quickly become the second most expensive in its history, behind only World War II. After the country entered a deep economic recession in 2008, the fiscal consequences of this practice became more obvious. By 2010, the United States was facing annual budget deficits, for the foreseeable future, of \$500 billion or more. After overseeing a decade of higher military spending, the Pentagon seemed resigned to a new round of budget cutting, which promised to make the 2010s reminiscent of the 1970s and 1990s. However, exactly how much the military might be affected by any new push for fiscal conservatism, in comparison with the social welfare programs that had come to absorb more public dollars, remained unclear.

As the second decade of the 21st century opened, with military budget cuts looming and China's national economy on a path to overtake the United States in terms of sheer size and industrial capacity, it was easy to forget that for the moment America remained an unrivalled military-industrial giant. It had clearly been so since the end of the Cold War; since 1942 it had been the world's most successful practitioner of the art of converting national economic productivity and technological innovation into military power. Its future achievements in this field would evidently depend on difficult political struggles at home, as well as developments abroad that were even harder to predict or control.

EFFECTIVENESS, COMBAT

Combat effectiveness is the ability of a military force to sustain itself and adapt to a continuously changing theater to ensure the success of its mission. The sustainment of troop strength and equipment readiness is vital in maintaining a state of combat effectiveness. The modern battlefield is abstract and in a state of continuous evolution. Traditionally, the effectiveness of a military force has been measured by its ability to close with, engage, and destroy its enemy. While this is relevant still, the nature of battle has evolved greatly over the past 20 years. Eliminating the threat

is no longer the isolated objective that determines the effectiveness of a force. Involvement in peacekeeping and counterinsurgency operations in the post-Vietnam era has tested the effectiveness of the U.S. military on levels exceeding that of direct action warfare. This entry examines factors important to combat effectiveness.

The U.S. military's foreign-based operations since 1990 have ranged from direct action combat to peacekeeping operations in their truest forms, requiring the military to maintain a high state of effectiveness on all levels. After 1989, major missions conducted by the U.S. military fit easily into the category of either peacekeeping or direct action warfare. This remained the case until the attacks of September 11, 2001, after which the two categories rapidly lost their definition and began to overlap. With the face of battle changing on a seemingly daily basis, the United States has learned through success and failure how to adapt to the current situation and maintain a fluid state of combat effectiveness.

While *combat* is the word that catches the eye first, *effectiveness* is the key word in the phrase. With the diverse nature of modern military operations for the United States, the ability to accomplish missions both in and out of wartime is essential. U.S. military effectiveness, wrote the historian Timothy K. Nenninger of the U.S. military leading up to its involvement in the First World War, was wholly dependent on American ability to adapt past wartime experiences to those of a world war. This holds more true in today's conflicts where the nature of the mission changes at a more rapid rate than it did at the beginning of the 20th century. It can be argued that while the United States made the necessary preparations for the World Wars and the Korean War, where combat effectiveness relied almost entirely on utilizing the most efficient means of killing the enemy, few changes were made when they were needed in Vietnam. Insurgent warfare affected U.S. operations as early as the Philippine War at the turn of the 20th century, and still the strategic changes necessary to counter the threat in Vietnam were widely ignored, allowing the same issue to go unaddressed until the darkest days of fighting in Iraq. The nature of U.S. involvement in world affairs today changes so frequently that the military must be able to identify these changes and be prepared to make modifications to its strategy. In short, the effectiveness of the U.S. military in history has been defined entirely by

its ability, or lack thereof, to identify the threat and take the necessary steps to overcome it with as little loss of life as possible.

Establishing and Maintaining Combat Effectiveness

Building a successful and effective force occurs at two essential levels. The first is the ground level where personnel are trained to maintain themselves and their equipment, remaining fully capable of mobilization while training for the task at hand. Ensuring that service members are at peak mental and physical readiness also occurs at this level. Highly trained personnel who can perform under varying circumstances make up the units fielded in combat and peacekeeping operations. However, the effectiveness of one unit depends solely on its ability to work with another. For example, an infantry platoon depends on an indirect fire element of mortars or artillery to support its mission.

Practical and realistic training is paramount in the doctrine of the U.S. military. The theory behind field training is to come as close to operational conditions as limits allow, by utilizing the same equipment and conducting the same mission types that service members are likely to encounter while operational, summed up with the phrase “train as you fight.” During wartime, information from the theater is relayed to stateside units so that the current operational environment can be emphasized in training. The current mission is generally the main focus, while a foundation in basic small unit tactics is regularly reviewed and maintained. During peacetime, similar training is done with the same emphasis on the most likely future conflict. The assets the U.S. military has at its disposal allow for such meticulous training to occur at all levels of organization that are vital parts of an effective force.

Joint operations conducted with several units occur at the second level of building effectiveness. Any unit, regardless of its internal readiness, is entirely ineffective without external support from other units. On every level, a unit requires services from external units in the form of food, water, ammunition, and intelligence. This can occur at a level as low as an infantry battalion resupplying one of its companies or as high as one nation assisting another. Referring again to the First and Second World Wars, American ground strategy only

succeeded because the United States first worked with Great Britain to free Atlantic merchant ships from the grip of German submarines.

Effectiveness in American Operations

While the United States has prided itself in its ability to effectively train and coordinate its military forces, the juxtaposition of direct action and peacekeeping operations that existed as time went on made maintaining effectiveness troublesome. Operation Desert Storm was perhaps the best example of U.S. engagement in direct action warfare in the sense that it consisted almost entirely of American offensive action. American air power set the stage within the first 48 hours by destroying Iraqi early detection radar and disrupting the enemy’s air defense network. Those strikes on key targets combined with the systematic elimination of the Kari (the command and control system of the Iraqi Air Force) gained coalition forces air superiority and cleared the way for the ground forces that followed. Vital to the success on the ground was coordination between ground forces and air assets so that enemy tanks and personnel could be found and eliminated, thereby decreasing risk to ground forces. Robert Cole maintains that the combination of strategic air power and tactical effort on the ground decisively produced the nearly bloodless victory for the United States in the Persian Gulf. The surge of modern technology on the battlefield forced stronger cohesion between branches of the military. In essence, the effectiveness of U.S. forces during Operation Desert Storm relied entirely on their capacity to adapt their personnel to the needs of the battlefield and to the innovations in battlefield technology. The ability of U.S. forces to coordinate efforts on a large scale to carry out the mission—often quite surgical in nature—led to the swift and decisive defeat of the Iraqi forces under Saddam Hussein. Air Force Lieutenant General David A. Deptula, when referring to the conduct of the U.S. military during Operation Enduring Freedom in 2001, emphasized the impact Desert Storm played on the future of combat effectiveness through joint force unity as a pivotal moment in wartime conduct. While the United States surged forward in battlefield effectiveness in and over Iraq in 1991, those honed skills would not come into large-scale use again for another decade.

For the remainder of the 1990s, the United States became involved in various peacekeeping operations across the globe. The effectiveness of the U.S. military depended on its ability to aid the people of particularly oppressed regions without the use of force. In 1992, the United States committed forces to Somalia in support of Operation Restore Hope, the mission being to aid those starving under the oppressive hand of warlord Mohamed Farrah Aideed. In theory, these missions were the polar opposite of direct action warfare, leaving the United States with explicit guidelines for furnishing effective forces and assets.

The terrorist attacks of September 11, 2001, led President George W. Bush to commit U.S. forces to Afghanistan and Iraq in 2001 and 2003, respectively. The two fronts became the main focus in the Global War on Terrorism (GWOT). Both invasions started in much the same respect as Desert Storm, with the formula of air, ground, and finally a combination of the two, but there the similarities ended. The following years in Afghanistan and Iraq, after the toppling of the Taliban and Saddam Hussein, brought on savage insurgent warfare that disrupted U.S. attempts to establish new governments in each country and kept the success of the missions at bay. Unlike Desert Storm, the coordination of overwhelming air power and conventional ground forces for direct action warfare was not enough to make the U.S. military effective in fighting insurgencies. It became clear that the U.S. policies on operational conduct needed rethinking.

Effectiveness and the Modern Battlefield

Coalition forces needed the population to assist in locating and disrupting insurgent cells to bring stability to surrounding regions. The effectiveness of the U.S. military depended on its ability to simultaneously dismantle the insurgencies and rebuild each respective country. The theory of counterinsurgency (COIN) emerged as a strategy focused on winning over the populace as the means to achieve the desired end results. The strategy was multifaceted, first requiring pressure to be kept on the insurgency so that insurgents would provide minimal interference with other operations. Next, the new governments of Iraq and Afghanistan needed to be established and in working order. This meant that the governments needed to manage legislation and their militaries independently before coalition forces

left them to fend for themselves. Finally, and perhaps most important, rapport needed to be built with the people. The challenge was making all three happen simultaneously, with one's success relying on the triumph of the other two.

General David Petraeus helped oversee the production of the U.S. military's counterinsurgency field manual, a work that initially received vehement criticism. The strategy put service members at greater risk by getting them out into communities for extended periods of time, earning public support for the governments. The risk was that by keeping the coalition forces exposed on the street, the probability of insurgent attack and ensuing casualties rose. Subject to further disapproval was decreased use of force. In theory, by limiting firepower to eliminate insurgent threats, collateral damage and civilian casualties could be kept to a minimum. The manual maintains that appeasing the sentiments of the populace is the key component, making the targeting of insurgents with excessive firepower counterproductive. Regardless of which side the locals supported, they would perceive the accidental killing of civilians and destruction of property as the fault of coalition forces, regardless of how many insurgents were killed in the process. While military officials often spoke out against the hazard to service members, defeating the insurgencies and rebuilding in Iraq and Afghanistan were cause for risk.

Friction over the use of COIN strategies in the GWOT arose as a result of the dissolving line separating direct action and peacekeeping operations. Prior to the GWOT, the post-Vietnam U.S. military committed itself to efforts that ultimately fell into one category or the other. The combination of both mission types in the GWOT differed from previous examples. When peacekeeping and direct action warfare became intermingled, indecisiveness over the most effective means of conducting operations in Iraq and Afghanistan resulted. After 4 years of trial and error, Petraeus and the COIN strategy became the signature method for both theaters of war. While COIN produced results in Iraq, the question remains as to whether the strategy that achieved success on urban Iraqi streets will prevail in rural Afghanistan.

Time will tell how effective the U.S. military is in the GWOT. Fighting insurgencies is perhaps the most fluid and unpredictable genre of warfare, and absolute flexibility is essential on all levels. Between 1990 and 2011, the United States has conducted

operations of varying sorts, under different circumstances. The effectiveness of the U.S. military has been tried by the changing of the battlefield and has had a generally positive result, but the line where combat ends and peacekeeping begins has blurred with time. In barely more than two decades, the battlefield has become more and more abstract, changing the needs of the forces involved and requiring an ever-fluid policy on how to maintain an effective force capable of accomplishing any mission. The military must now address the entire spectrum of its operations at once, making success difficult and, at times, indefinable. The future effectiveness of the U.S. military will depend entirely on its ability to work cohesively to evolve with warfare and to keep up with all of the finite aspects of missions to come.

EGYPT

Egypt, an Arab state located in the northeastern corner of Africa, serves as the bridge between the African continent and the Middle East. Egypt's population of 76.9 million makes it the most populous Arab state. Sunni Islam is the predominant religion, although the country also contains a sizeable Coptic Christian minority (9%). The capital city of Cairo is located on the banks of the Nile River. Egypt's arable land, less than 3% of the total area, is concentrated on the banks of the Nile and in the Delta region on the Mediterranean coast. The Suez Canal, nationalized

in 1956, is a key economic and strategic resource. Egypt's economy also draws on revenues from tourism and the export of oil and natural gas, as well as agricultural products such as cotton. This entry discusses Egypt's political system, armed forces, and foreign policy.

Political System

Egypt is a republic with a bicameral legislature. The military plays an important role in Egyptian politics, and all of Egypt's presidents from the 1952 revolution until the 2011 protests were military officers. The president wields great power, and Hosni Mubarak's reelection in 2005 with 89% of the popular vote, along with irregularities in the 2010 parliamentary elections, sparked debates about Egypt's lack of political transparency. The National Democratic Party, which came to power in 1978, severely limited the formation of viable opposition parties. Egypt's political system was transformed by the 18 days of protest in January–February 2011 that led to Mubarak's resignation after 30 years in office. The protests reflected Egyptian youths' increasing frustrations with limited economic opportunities and the oppressive Egyptian political system. In the aftermath of Mubarak's resignation, the Supreme Council of the Armed Forces assumed control of the government.

The Muslim Brotherhood, an Islamist organization founded in 1928, has historically been the most significant opposition force in Egypt. Formally outlawed before the 2011 revolution, the Muslim Brotherhood has since become a major political actor. Its Freedom and Justice Party won the largest number of seats in the November 2011–January 2012 parliamentary elections, while its nominee for president, Mohamed Morsi, won the June 2012 presidential election. The struggle between the Muslim Brotherhood and the Egyptian military for political power continues to be one of the most pressing issues in Egypt.

In recent years, militant Islamist groups have posed a threat to Egyptian stability, in particular the Jamaat al-Islamiyya and the Egyptian Islamic Jihad, which merged with al Qaeda in 2001. Terrorist attacks on tourist areas in Egypt, most notably at Luxor in 1997 and at a number of Red Sea resorts in 2004–2006, were a severe blow to Egypt's tourist

Map of Egypt.

industry. The threat of terrorism was cited as the main reason for the periodic renewal of Egypt's Emergency Law, continuously in effect from 1981 until May 2012. Human rights groups criticized the law for serving as a cover for human rights abuses and censorship, and the Egyptian public's resentment of the Emergency Law was one of the contributing factors to the 2011 revolution.

Foreign Policy and Defense

The Arab-Israeli conflict dominates Egypt's foreign policy. Egypt's reputation under President Gamal

Abdel Nasser was tarnished by its disastrous performance in the 1967 Six Day War. The Egyptian offensive in the 1973 October War was ultimately repelled, but Egypt's initial success in crossing the Suez Canal is still commemorated as one of the country's great military achievements. The signing of the Camp David Accords in 1978 and the Egyptian-Israeli Peace Treaty of 1979 led to Egyptian recognition of Israel and Israel's withdrawal from the Sinai Peninsula in 1982. Mubarak's policy of cooperation with Israel, notably in the 2008–2009 Gaza War, was unpopular with the Egyptian public. The 2011 Arab Spring led to a reassessment of Egypt's

role in this conflict, signaled by Egypt's decision to reopen the Gaza border.

Egypt has the largest military in the Arab world. Total active forces in 2006 numbered 468,500, of whom two thirds were conscripts, serving in four branches: (1) the army, (2) the navy, (3) the air force, and (4) the Air Defense Command. Egypt's army is composed of four armored divisions as well as eight mechanized infantry divisions. In 2005, military spending accounted for 3.4% of gross domestic product.

Egypt's army still maintains large stocks of Soviet-era equipment, but it has used the \$1.3 billion in U.S. military assistance received annually to purchase advanced American systems. This military aid, in addition to the \$28 billion in economic aid received since 1975, makes Egypt one of the greatest

beneficiaries of U.S. foreign assistance. A 1988 U.S.-Egyptian agreement established an Egyptian assembly plant for M-1A1 Abrams tanks, of which Egypt had 755 in 2006 out of a total of 3,855 tanks. The Egyptian navy has 4 Chinese-type 033 *Romeo*-class diesel submarines and a surface fleet composed of 10 U.S., Spanish, and Chinese frigates, as well as smaller craft. Egypt's air force possesses the fourth-largest fleet of F-16s in the world, totaling 220 F-16As-Ds. Operation Bright Star, a biennial U.S. central command-Egyptian joint training exercise first held in 1981, is the cornerstone of the U.S.-Egyptian military relationship. Egypt has participated in a number of peacekeeping operations around the world and provided one of the largest contingents to the coalition forces during Operation Desert Storm in 1991.

Egyptian army troops fire tear gas to disperse an antimilitary demonstration outside the defense ministry in Cairo's Abbasiya district on May 4, 2012. Heavy gunfire could be heard as clashes between troops and antimilitary protesters spread around the ministry building and street battles raged in side roads.

Future Prospects

Today, Egypt faces a number of internal and external pressures tied to the 2011 revolution, including a deep economic crisis, episodes of sectarian violence, and an increase in crime rates. Egypt's postrevolution political debates reflect concerns about the long-term plans of Islamist groups, such as the Muslim Brotherhood and the more conservative Salafists, who have dominated recent elections. Questions remain as to whether the reforms undertaken since February 2011 will be enough to satisfy the demands of protestors and whether the military will peacefully cede control to a civilian government. Egypt's relationship with Israel and the Palestinians is also in flux, as Egypt is expected to take a more independent line that could clash with U.S. interests. Political instability in neighboring Sudan and tensions over access to the waters of the Nile are additional security concerns.

ENGINEERS, COMBAT

Combat engineers are distinct components of the military engineering community who are assigned a specific military occupational specialty in the U.S. Army and U.S. Marine Corps. The attribute of *combat* in the title illustrates the focus of this specific discipline, one that integrates with and operates as part of ground combat forces. Combat engineers are organized, trained, and equipped to perform a broad range of combat support missions required by ground forces under combat conditions. These tasks support a maneuver unit's ability to conduct ground force tactics during combat operations, but combat engineers themselves are also trained to serve in a secondary role as infantrymen if required.

Combat Engineering Activities

The focus of the activities for combat engineers is direct combat support and providing engineering assistance to ground combat forces. Personnel assigned this military occupational specialty are taught a variety of skills ranging from construction and carpentry to demolition usage and land mine clearing. The gamut of combat engineering missions incorporates four principal concentrations: (1) mobility, (2) countermobility, (3) survivability, and (4) general engineering.

Mobility

Mobility is the ability of military forces to maneuver from position to position on the battlefield while retaining the capability to fulfill their primary mission. The overall objective of mobility operations for combat engineers is to ensure and maintain freedom of movement for maneuver units. In mobility operations, combat engineers are required to perform the following tasks:

- Conduct engineer reconnaissance
- Construct fixed and floating bridges
- Clear helicopter landing sites
- Improve beaches
- Provide technical engineer advice to ground forces
- Place and detonate demolitions
- Conduct obstacle breaching operations
- Conduct assault river-crossing operations
- Execute target demolition
- Detect mines by visual means or by using a mine detector
- Conduct route reconnaissance and clearance operations
- Conduct nonexplosive obstacle/debris removal

Countermobility

Countermobility is accomplished by reinforcing natural terrain through the construction of obstacles to disrupt, delay, or destroy the enemy. The primary objective of countermobility operations is to slow or redirect the enemy, increase time for target acquisition, and increase weapon effectiveness without affecting the movement of friendly forces.

In countermobility operations, combat engineers are required to perform the following tasks:

- Construct defensive positions for weapons and personnel
- Place mines/construct minefields
- Plan/Install obstacles and barriers, including wire
- Employ specialized demolitions

Survivability

Survivability is the ability of personnel, equipment, and facilities to continue to operate within the wide range of conditions faced in a combat environment. Survivability includes those aspects of protecting personnel, weapons, and supplies by employing good tactics, continuing fortification of existing bases, deception, camouflage, and constructing fighting and protective positions. Survivability operations will not completely eliminate vulnerability to fires on the modern battlefield or the effects of weather, but they can limit losses by reducing exposure to enemy weapons and the weather. In survivability operations, combat engineers are required to conduct the following tasks:

- Construct fighting positions for individuals and weapons
- Construct field fortifications, such as bunkers and combat outposts
- Employ specialized demolitions

General Engineering

Although construction and general engineering missions are understood to be a distinct subset of military engineering and not a primary responsibility of engineers assigned to combat units, combat engineers are able to perform some general engineering tasks. Activities such as vertical construction, concrete work, and expeditionary airfield construction are performed as missions dictate, but combat engineer capabilities to perform such tasks are often limited by their training and equipment and are designed only for temporary duration. General engineering is typically characterized by high standards of design, construction, and detailed planning and preparation, and it is performed by specially trained troops, such as those in Naval Mobile Construction Battalions or "Seabees."

General engineering normally serves more than just combat troops (e.g., logistical units), and the majority of tasks are performed in the rear area. In addition to some of the general engineering and construction missions listed above, combat engineers may be required to perform or assist in the construction of standard and nonstandard bridging, roads and airstrips, and soil stabilization projects.

Combat Engineering Equipment

Combat engineers are equipped with standard tool kits and sets, which include basic construction tools such as hammers, saws, drills, planers, and similar carpentry equipment; pioneer kits, which include tools and equipment that assist in obstacle removal and construction, such as axes, mattocks, rope and pulley systems, chainsaws, and tree-climbing gear; demolition sets, which include electrical and non-electrical firing devices, and electrical wire; breaching kits; and minefield marking equipment. These sets and kits are designed to be boxed and made available to those combat engineers at or near the front line of combat troops. In many cases, combat engineers will carry with them the most commonly used tools for the missions they are conducting.

Additionally, combat engineers operate large pieces of military equipment that facilitate their respective tasks and missions. The Assault Breacher Vehicle is formed from the chassis of an M1A1 tank and is designed to breach obstacles and ensure mobility. The Assault Breacher Vehicle is armed with a mine-clearing line charge, a rocket launched line of explosives designed to penetrate a row of mines, wire obstacles, or other obstacles. Combat engineers also employ a variety of robots designed to approach and interrogate potential explosive devices. Mine-resistant ambush-protected vehicles provide combat engineers a wheeled asset capable of withstanding explosive attacks from land mines or improvised explosive devices in route reconnaissance and clearance missions.

Combat Engineers in Operations Iraqi Freedom and Enduring Freedom

The rise of irregular threats against U.S. forces and the conduct of counterinsurgency operations during Operations Iraqi Freedom and Enduring Freedom have created new challenges to combat

engineering, but the principal activities of mobility, countermobility, and survivability remain vital to combat operations. Combat engineers of the U.S. Army and U.S. Marine Corps supported numerous combat operations by performing extensive route reconnaissance and clearance missions, which included exploding improvised explosive devices and conducting demolition raids. In this capacity, combat engineers deployed Route Reconnaissance and Clearance platoons, comprising vehicle-borne troops in mine-resistant ambush-protected vehicles, to ensure the safe passage along primary supply routes and roads potentially laden with improvised explosive devices. Using robots and minesweepers to detect potential explosives along frequently traveled roads, combat engineers ensured the mobility of U.S. forces throughout the military area of operations. Additionally, combat engineers built combat outposts and patrol bases and laid assault bridges to increase the military presence in the regions assigned and provide force protection measures to forces conducting military operations.

ENVIRONMENT

Armed forces are responsible for managing considerable ranges of land, and as a result, they are among the largest environmental managers in the world. The U.S. Department of Defense (DOD) managed (in 2004) approximately 30 million acres (48,000 square miles) that contain an astonishing variety of natural and cultural resources in a wide and diverse range of environments, including prairies, deserts,

mountains, jungles, arctic tundra, reefs, inland waters, and oceans, that contained critical animal habitat, endangered flora and fauna species, and national and international archaeological and architectural treasures. To successfully integrate land stewardship responsibilities with training demands, and during operational deployments, armed forces employ a variety of methodologies. This entry discusses the efforts of the DOD to manage and protect natural and cultural resources.

Proper environmental management is integral to maintaining the integrity of training areas, particularly given the heavy weights and large size of modern tactical vehicles and extended operational ranges of many weapon systems. If the environmental impacts of training activities are not properly anticipated and deleterious effects are not properly mitigated, vegetation will be destroyed, the desired training environment will not be retained, and environmental damage such as soil erosion and landslides can render a training area impassable. Environmental impacts such as wildfires resulting from the detonation of military ordnance can prevent training from being conducted; desired tactical conditions such as woodlands, jungle canopies, cliffs to be traversed, and streams and rivers cannot be maintained, and training can be adversely affected.

Planning

Within the United States, environmental planning is guided by the National Environmental Policy Act of 1969, which requires that the effects of any proposed action(s) on the natural and human environment are taken into account before such an activity is permitted to proceed. The act's analysis and documentation might be as simple as a single-page memorandum determining that no effect is anticipated, to a single-volume environmental assessment that serves as a midlevel analytical document, to multiple-volume environmental impact statements that require years to prepare.

Management Measures

Water

Within the United States, the defining legislation for water conservation and protection are the Clean Water Act and the Safe Drinking Water Act. Compliance includes actions typical of any other

community in the United States, particularly to safeguard potable water sources and inland water courses. Among the biggest challenges faced by DOD have been fuel spills (particularly during field training by mechanized units) and fuel storage (particularly large-capacity underground tanks employed because of security considerations). In recent years, the DOD has taken additional measures to safeguard water resources.

Air

The Clean Air Act is the overriding legislation to protect air quality within the United States. Various types of military training and operational activities have the potential to adversely affect air quality, particularly smoke generation to obscure tactical movements, employment of a range of military munitions, and operation of aircraft and vehicles. As with water resources, sustainment of air quality has proven to be challenging for DOD, and recent initiatives have sought to improve practices to reduce or eliminate air emissions.

Natural Resources

Management of natural resources including flora and fauna is a part of the military's stewardship. In the United States, this is predominantly, but certainly not exclusively, done through compliance with the Endangered Species Act. Although it might appear that military training is incompatible with wildlife and habitat development and sustainment, the DOD is among the most active and successful government agencies in the protection and management of natural resources. For example, at the United States Military Academy in West Point, New York, the 16,000-acre training reservation is used intensively during the 3 summer months for the performance of Cadet Annual Field Training, but for the remaining 9 months of the year, it is essentially operated as a wildlife refuge. In the southeastern United States, DOD installations have been preeminently successful in supporting efforts to preserve and expand the population and habitat of the red-cockaded woodpecker, one of the first species to be formally listed as endangered, in 1970, and which is now no longer seriously threatened. This is only one of hundreds of similar success stories.

Most installations have agronomists and foresters on their staff to ensure that vegetation and natural

resources are carefully managed. Hunting is encouraged on most DOD installations with careful management and review, as a successful mechanism for managing and controlling animal populations. For example, in the northeastern United States, the beaver population has seen recent growth, with resulting expansion of the range of the beaver population, which has damaged and constrained training areas through dam construction and pond/swamp creation. DOD Natural Resource specialists coordinate closely with Range and Training staff to mitigate such occurrences.

Cultural Resources

Cultural Resource Management includes both archaeological and architectural resources and can even include historic landscapes. In particular, the preservation of historic structures, monuments, commemorative and interpretive plaques, memorials, and historic cannon plays an important role in the developing and maintaining of morale, esprit de corps, unit pride, and military tradition. At West Point, massive stone inscriptions of battle honors from the American Revolution and Mexican-American War line the Hudson River. Many military installations also contain the sites of historic fortifications, battlefields, or campaigns, particularly in Europe. These historic sites provide a ready opportunity for staff rides, tactical training, and military history instruction.

DOD Cultural Resources Management complies with a range of statutes, including the National Historic Preservation Act, the Archaeological Resources and Protection Act, and the Native American Graves Protection and Repatriation Act. Archaeological investigation is typically performed in advance of any ground-disturbing activities, and monitoring by professionally qualified archaeologists during such activities is also routine. Repairs, modifications, alterations, expansion, or demolition of historic buildings are also carefully reviewed, and comprehensive measures to protect the historic integrity of such structures are identified and fulfilled. The DOD has established written agreements with interested Native American or Indian nations or tribes for most installations to ensure that Native American considerations and concerns are identified and considered during the planning process for activities and incorporated into all installation events.

Hazardous Waste

Extended military activities over a range of time frequently lead to various forms of contamination of training areas. This might range from relatively simple contamination such as a high concentration of lead at a long-established rifle range to explosive residue being found within an impact area or more serious industrial pollution caused by industrial manufacture or testing of particularly hazardous materials such as nuclear, biological, or chemical weapons. Such conditions may threaten the health and welfare of soldiers and civilians training on or utilizing these grounds and facilities, or result in contamination from runoff or migration to adjacent population centers and communities.

Formerly contested battlefields frequently contain unexploded ordnance. Land mines litter modern battlefields throughout the world, particularly in Africa, Vietnam, and Afghanistan, and annually kill and maim thousands of civilians, many of them children. During her lifetime, Princess Diana of the United Kingdom was particularly renowned for her campaign for land mine elimination and removal. Even 135 years after the end of the American Civil War, an occasional Civil War buff is killed by an unearthed artillery projectile. In France and Belgium, it is not uncommon for unexploded chemical weapons containing hazardous substances such as phosgene, mustard, or chlorine gas to still be discovered, nearly a century after the end of World War I. French military explosive ordnance disposal teams still roam the countryside to safely remove unexploded ordnance. Doves, the Belgian Army's explosive ordnance disposal team, receives no fewer than 3,000 annual calls for assistance to remove hundreds of tons of shells, trench mortars, grenades, and other weapons still littering farm fields and neighborhoods from that conflict. Doves anticipates that another 70 years will be required to eliminate all of the unexploded ordnance just from World War I in their country.

In the United States, the primary legislation governing the treatment and disposal of solid and hazardous waste is the Resource Conservation and Recovery Act (RCRA) of 1976. RCRA has established national goals for the United States, which the DOD is responsible for compliance with. The goals are as follows:

- Protecting human health and the environment from the potential hazards of waste disposal
- Conserving energy and natural resources
- Reducing the amount of waste generated
- Ensuring that wastes are managed in an environmentally sound manner

RCRA provides for the management of hazardous materials and hazardous wastes from their point of generation, through transportation, use, and eventual elimination (through either treatment or disposal). Due to the extensive tracking requirements throughout the life cycle of all hazardous materials and waste, the overall process has become known as the "cradle-to-grave" system. As with all other users, the DOD adheres to stringent bookkeeping and reporting requirements on all aspects of hazardous materials and wastes. A related legislation is the Comprehensive Environmental Response, Compensation, and Liability Act, also known as "Superfund," which focuses on the remediation of known hazardous waste sites.

Because many materials that a military employs are inherently hazardous, compliance with RCRA and Superfund demand considerable attention from training activities and installations. Numerous older military installations have suffered from lack of careful environmental management practices in previous decades, and cleanup activities at some facilities are anticipated to continue for many years at considerable expense. For example, the historic Parrott Cannon foundry that operated in Cold Spring, Putnam County, New York, for most of the 19th and 20th centuries was once identified as a Superfund site because of extensive contamination, and the Marathon Battery Company Superfund Site required exhaustive archaeology and remediation before it could be returned to the community in 1993.

Tactical Deployments

Environmental management remains an important consideration even during active deployments. Failure to adhere to proper environmental management procedures has the potential to cause deleterious effects to the health and welfare of soldiers by improper storage and disposal of potentially hazardous wastes (e.g., batteries and fuel) and contamination of potable water sources; failure to manage water runoff and erosion can lead to damage to transportation and other infrastructure; and

destruction of vegetation can remove cover and concealment. Inadvertent or intentional destruction of heritage resources can also result in adverse information operations—warfare effects. For example, in the spring of 2001, the Taliban in Afghanistan destroyed ancient, massive Buddha statues in the Bamiyan Valley of Afghanistan against strong worldwide opposition. Facing invasion by the U.S.-led coalition in the fall of 2001, the Taliban subsequently found themselves without international supporters. In 2003, during the invasion of Iraq, the U.S. Marine Corps constructed a base directly atop Babylonian archaeological ruins and failed to safeguard archaeological treasures in the Iraqi Museum from looting. Both actions earned the U.S. enmity from a wide range of academic and media observers. Accordingly, the DOD has initiated various educational and training initiatives intended to prevent both intentional and inadvertent damage to environmentally and culturally significant properties. During combat operations, significant heritage sites or natural resource areas are identified during planning for operations, and are typically placed off-limits for weapon employment and tactical maneuvers. Such resource areas are also identified in advance so that measures can be taken to safeguard them following the conclusion of active military operations.

Conclusion

Environmental stewardship and management is an important but frequently overlooked aspect of military training, installation operation, and tactical deployments. Compliance with environmental laws, regulations, and policies is critical to protecting the integrity of training areas, and precluding damage from occurring to training areas that would prevent their repeated and regular use. Cultural resources on military installations can actually serve to facilitate military training and instruction, and to support military pride and traditions. During the 19th and early 20th centuries, militaries tended to pay little attention to environmental stewardship. However, modern militaries recognize that this is an important element of safeguarding their soldiers and the communities that soldiers and their families live in and of facilitating realistic training. Appreciation of significant and valuable resource areas (both natural and human-made) fosters a positive relationship with indigenous populations and directly

contributes to successful execution of population-centric counterinsurgency.

ETHICS

In the context of this entry, *ethics* will be understood to refer primarily, though not exclusively, to *military ethics*. In the past, military ethics (when it was even considered at all as a distinct topic) was liable to be characterized ungenerously, as a kind of oxymoron—inasmuch as military force is often understood merely as indiscriminate and destructive violence ensuing when both the normal moral order and the rule of law have collapsed. Otherwise, military ethics would likely be described as a synonym for the “just war” theory, in turn misleadingly portrayed as a conversation of limited cultural and historical jurisdiction carried on among Christian theologians (primarily Roman Catholics of the medieval era in western Europe) concerning the permissibility of waging war in defense of the state.

Military ethics, however, is an enquiry distinct from that concerning the justification of war, which itself is not nearly as culturally or historically limited and formulaic as its practitioners and detractors alike quite often portray it. Broad, philosophical discussions concerning the morality of war, and its limited justification as a last resort for political conflict

resolution, can be found in various forms in virtually any culture or historical epoch. Properly understood, just war reasoning is a form of “ideal speech” or public discourse, encountered in many cultures throughout history, concerning one of the gravest and most important moral decisions any society can make: deciding to commit its soldiers and citizens to the risks of harm in war.

Military ethics, somewhat in contrast, should be understood in a more restricted sense as a species of professional ethics, similar in kind to discussions among practitioners (e.g., physicians, clergy, journalists, or lawyers, as well as those who advise, consult with, or study them) regarding professional probity, rectitude, aspirations for best practice, and the boundaries of minimally acceptable practice within their distinct professional community. These confusions about definition and domain arise naturally in the ambiguity inherent in the nature of ethics itself.

Ethics and Morality

In ordinary conversation or customary public discourse, the terms *ethics* and *morality* are often used interchangeably, as synonyms. Historically and etymologically, this customary usage is correct (as far as it goes). The two terms are derived from Greek and Latin words denoting more or less the same set of problems or questions regarding how one ought to live the best possible life, including “How should I act, what ought I to value, and what do I owe to others?”

Scholars sometimes invoke finer distinctions, defining *morality* as the various sets of answers one might give to the questions above, and *ethics* as the discipline that engages in the study and comparative analysis of the resulting theories or conceptions of morality generated by competing answers to these questions. In this sense, *ethics* is then defined as the philosophical examination of morality (or, more precisely, of different systems of morality, or varieties of *moral beliefs*).

In other contexts, as in the study of professional ethics, for example, the term *ethics* is reserved for the specific principles defining both best practices and the limits of acceptable practice within a profession (e.g., medical ethics, legal ethics, journalistic ethics, military ethics). *Morality* is then defined as the more general, universal, background set of

principles applying to each and every person, regardless of his or her professional stance. The domain of morality includes general principles such as *primum non nocere* (“first do no harm”); reciprocity or “the Golden Rule,” most precisely formulated as *informed consent* (do not involve other persons in one’s own strategies or policies, or undertake actions that affect others in pursuit of such policies, without their full prior knowledge and consent); and what we might otherwise characterize as the demands of justice and respect for the most basic human rights. These abstract and highly general *moral* principles, in turn, infuse the concrete *ethical codes* and principles of professional practice that govern the members of discrete communities of practice, such as medicine and the military.

Ethics and Law

In yet other contexts, ethics is sometimes thought to consist largely of respect for, and compliance with, provisions of the law. This widespread belief among rank-and-file citizens finds its way into many forms of organizational behavior, such as appointing lawyers as “ethics advisors,” conducting periodic organizational “ethics training” wholly as a review of applicable laws and regulatory statutes, and equating ethics itself with compliance—by military personnel, civil servants, or corporate employees—with relevant public law or applicable federal or corporate regulations.

Without doubt, showing proper respect for the rule of law, and living in accord with its dictates and constraints, constitutes an important dimension of morality. There are, however, a number of problems and pitfalls encountered in simply equating or conflating law and morality, such as encouraging the inappropriate conviction that one has attained a satisfactory level of moral behavior in one’s life simply by remaining in compliance with the law. Living what most persons would consider a “good” or “morally worthy” life, however, includes engaging in behaviors and cultivating attitudes toward others that the law itself cannot strictly require. The law may command that you properly care for and refrain from doing harm to your children, for example, but it cannot command you to love them. The law may prohibit your doing bodily harm to others or defrauding them of their money or possessions, but it cannot compel you to care about the positive welfare of others, let alone compel you to

do good deeds for their benefit. Those latter kinds of attitudes and behaviors that seem to lie beyond the requirements of law are, nonetheless, essential components of what most people otherwise regard as the province of ethics or morality.

As a further complication, the written “Codes of Ethics” often formulated and adopted by members of distinct professional societies, such as the *Belmont Report* and the *Declarations of Helsinki*, pertaining to medicine and the social and behavioral sciences resemble formal legislation and are often arrived at through collective deliberations that resemble a formal legislative process. Insofar as they serve to define rectitude and professional probity by prohibiting certain forms of unacceptable practices (e.g., actively harming or injuring patients or clients) and requiring others as minimum standards of professional conduct (e.g., a client’s or patient’s informed consent to medical procedures or exposure to financial risk), professional codes of ethics further appear to resemble formal legislation.

They differ from the latter, however, in that, absent genuine formal legislation by society or the state to criminalize the infractions specified in a profession’s code of ethics, the professional organizations themselves possess no independent authority to sanction behavior or punish violations of their codes, apart from reprimand, censure, or revocation of the wrongdoer’s membership in the professional organization (which may admittedly be achieved through withholding or revoking a legally required license to practice). Codes of ethics differ further from formal legislation, in that, quite often, such codes attempt to delineate the core values of the profession, or otherwise attempt to define professional best practices as aspirations for ideal or exemplary conduct by the profession’s members, an important function of ethics that the law (apart from the tradition of “natural law”), in contrast, pointedly ignores. Because codes of ethics represent a form of voluntary self-governance distinct from formal legislation, scholars of jurisprudence have increasingly come to define these various codes as forms of “soft law.”

In the context of *professional military practice*, such distinctions are especially vexing. On the one hand, the “profession of arms” broadly encompasses ancient traditions of self-governance, designated as codes of behavior for the society’s warriors (e.g., the *Code of Chivalry* in medieval Europe or the *Bushido Code* of the Samurai in medieval Japan) that seem

to define rectitude and professional probity and are also inspirational in the sense described above but that, in most other respects, often appear inchoate, outmoded, and, in any case, possess no formal legislative authority. On the other hand, bodies of legislation outlining the state’s jurisdiction over its military personnel are often designated as “codes” (e.g., the Uniform Code of Military Justice in the United States) and do establish formal, legal authority and accountability over the behavior of the profession’s members, while utterly lacking the ideal or inspirational qualities of best practices that usually characterize a profession’s own, internally devised code. As a result, quite apart from the domain of formal governance, military services and organizations in many nations and cultures find it incumbent to attempt independently to define the service’s *core values* and to articulate aspirations and ideals of best practice that attempt to capture the *professional military ethic* in a positive, moral (as opposed to a purely legal) sense and, hence, define the profession itself in terms of its highest ideals (rather than minimally tolerable behavior).

Military Ethics and Just War Theory

A historically noteworthy example of the latter process was the formulation, in 1863, of “General Orders 100,” known unofficially as the “Lieber Code” (after its principal formulator, the German-born American jurist at Columbia University, Francis Lieber). At the behest of President Abraham Lincoln, this document sought to set forth, clarify, and codify expectations of proper military conduct regarding the treatment of subordinates, enemy prisoners, and civilian noncombatants for officers in the Union Army during the American Civil War. Many of the prohibitions regarding abuse of prisoners and noncombatants were enforceable and punishable in principle, and thus, the document served in a limited sense as formal legislation. But it likewise drew on widespread practice and custom within the armed forces to define professional probity and rectitude and set forth high standards of professional conduct as well as constraints on minimally acceptable professional behavior and so functioned as a provisional code of ethics for the profession of arms as well.

In the latter sense, the Lieber Code was widely admired, and its provisions were emulated and ultimately adopted by the armed forces of other nations

during the 19th century, most notably the Prussian Army (in which Lieber himself had served during the Napoleonic wars). From there, the most significant constraints and professional ideals found their way into the Hague Conventions on Land Warfare of 1899 and 1907, which served, in turn, as the founding documents of contemporary international law of armed conflict, also known as international humanitarian law.

This reference to international law may seem to contradict the earlier claim that law and morality constitute distinctive domains. International law, however, and international humanitarian law, in particular, constitute unusual realms of jurisprudence in their own right, often appearing to lack the authority, jurisdiction, and, most importantly, the sanctions requisite to formal legislation and governance. Far more than domestic law, moreover, international law attempts to embody, codify, and insofar as possible, enforce broad moral or ethical norms designed to mitigate the worst forms of human suffering attendant on war in particular. Accordingly, the boundaries between law and morality, as well as between what can (or ought to) be enforced versus what is enjoined or exhorted as ideal or exemplary practice, are especially imprecise (as, e.g., in the UN's Universal Declaration of Human Rights of 1948).

This wider ambiguity is reflected in the manner in which legal and moral considerations are presented and taught to initiates in the military profession. In the context of just war doctrine, for example, the proper conduct of war constitutes a moral discussion traditionally labeled *jus in bello* to distinguish it from the moral considerations attendant on the justification for entering into war, *jus ad bellum*. The latter is thought to be primarily the province of political leaders and statesmen, while the former pertains primarily to restraints on the conduct of military personnel engaged in an otherwise-justifiable conflict. *Jus in bello* is actually the older of these two branches of just war discourse, ranging from laws in ancient India and China concerning those exempt from attack in the midst of war to the outlines by Socrates of prohibitions against vengeful, excessively destructive, or indiscriminate military tactics in Plato's *Republic*. The focus in these formulations is often as much on the warrior's own well-being, as on that of the enemy or the victim, seeking to guard the warrior's honor and personal character from the devastating consequences of engaging in normally

prohibited violence, while differentiating mere criminals and murderers from justified combatants mainly by the unwillingness of the latter to engage in indiscriminate violence against those who do not merit such treatment.

This classical moral discourse about the limitations on the warrior's conduct during combat thus has the character of a professional code of ethics, enjoining high standards of professional conduct as a voluntary outgrowth of the most essential core values, practices, and cherished traditions of the members of the profession of arms, past and present. In contrast, the "Law of Armed Conflict" is often presented as a bewildering and inchoate jumble of arcane prohibitions and legal restrictions, stemming from treaties and conventions whose relevance and authority appear questionable, and the significance and justification of whose resulting provisions or rules of engagement within the context of specific armed conflicts often seem neither clear nor reasonable.

Compliance on the part of military personnel with what appear to be arbitrary restrictions, formulated and externally imposed on their activities by those who are themselves insulated and abstracted from the exigencies of armed conflict, is understandably grudging at best. The suspicion and cynicism of combatants regarding the law of armed conflict, however, result largely from the failure to portray such constraints as both embodying the values and reflecting the long-standing practices and traditions of the profession itself. Therein lie the chief challenge and responsibility of professional military ethics education, and the chief justification for including the study of both dimensions of just war doctrine within its purview, even when members of the military profession themselves are thought not to be charged directly with the responsibility for the state's decisions to resolve conflicts through force of arms.

In truth, it is specifically incumbent on members of the profession of arms (as distinguished from the obligations of citizens generally) to attain a full and adequate understanding and commitment to the nature of their practice, of their distinctive role within the larger political order, and, most especially, of the peculiar responsibilities that devolve uniquely to them within this larger political context or framework to uphold acceptable standards of personal conduct, public service, and sound professional

practice. The latter include both knowledge and proficient mastery of *morally justifiable* and *legally permissible* military strategy and tactics, on the basis of which, in turn, military professionals are required to provide competent and accurate (even if sometimes unwelcome) advice to immediate supervisors and political leaders concerning the prudence, feasibility, and morality of their proposed uses of military force for political ends.

Finally, military personnel should possess the requisite knowledge and professional competence to carry out their socially assigned roles and responsibilities to defend their homeland and maintain the rule of law generally, as well as defend the lives and welfare of vulnerable victims of wanton violence when required, through the judicious and economical use of deadly force. Importantly, the latter encompasses the constant exercise of their individual autonomy and good judgment to avoid being drawn into professional malfeasance and illegal behavior, including the willingness to refuse even to countenance, let alone to order (or themselves participate in) strategies or tactics that transparently constitute such professional malfeasance.

EUROPE

Europe occupies 8% of the world's surface and includes 50 internationally recognized countries (Albania, Andorra, Armenia, Austria, Azerbaijan, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Georgia, Germany, Greece, Hungary, Iceland, Ireland, Italy, Kazakhstan, Kosovo, Latvia, Liechtenstein, Lithuania, Luxembourg, Macedonia [officially called Former Yugoslav Republic of Macedonia], Malta, Moldova, Monaco, Montenegro, the Netherlands, Norway, Poland, Portugal, Romania, Russian Federation, San Marino, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Ukraine, the United Kingdom, and Vatican City). It is bounded on the north by the Arctic Ocean, on the west by the Atlantic Ocean, and on the south by the Mediterranean Sea; its eastern border conventionally runs along the Ural Mountains and Ural River, swinging south to include the trans-Caucasian republics. Europe can be divided into six composite regions, which are not all equally homogeneous: Scandinavia, western Europe, central Europe, eastern Europe, Mediterranean Europe, and the Balkans. Out of the 50 European countries, 28 (Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom) are the member states of the European Union (EU)—the world's most integrated and extensive system of international governance. This entry briefly looks at conflicts and wars in Europe during the past century, then discusses the EU, challenges to security, civil-military relations in Europe, and the EU's relationship with the United States.

Recent History

Much of the European history of the 20th century was consumed by the two World Wars and the Cold War. At the end of the 20th century, the European continent experienced the collapse of communism and the dissolution of the Soviet Union (the USSR). This process started with the rise of nationalist movements in eastern Europe and the Soviet defeat

in Afghanistan. After Poland's electorate voted the Communists out of government in June 1989, Hungary and Czechoslovakia followed Poland's example by October. On November 9, 1989, the East German government opened the Berlin Wall, and East Germany was united with West Germany. Finally, in 1991, the USSR disintegrated into 15 separate countries: Lithuania, Estonia, Latvia, and Armenia declared or restored independence in 1990; Azerbaijan, Georgia, Russia, Uzbekistan, Moldova, Ukraine, Belarus, Turkmenistan, Tajikistan, Kazakhstan, and Kyrgyz declared sovereignty in 1991. As the power of the central government was considerably weakened (the Kremlin could no longer rely on the cooperation of government figures in the republics), in December 1991, Russia, Belarus, and Ukraine announced the establishment of the Commonwealth of Independent States (CIS): This marked the final collapse of the USSR.

Diminishing power of the USSR in the 1980s and the eventual fall of communism led to the collapse of the Warsaw Pact. Czechoslovakia, Hungary, and Poland announced in January and Bulgaria in February 1991 that they would withdraw all cooperation from the Warsaw Treaty Organization from July 1, 1991. In response, the USSR announced that the military structure of the pact could be wound up by March 31, 1991. The Warsaw Pact was officially dissolved in Prague on July 1, 1991; after the end of the Cold War, it became both unnecessary and unwanted. The USSR's subsequent efforts to persuade the countries that had left its sphere of influence to sign agreements renouncing military alliances and bases were rejected by Bulgaria, Czechoslovakia, Hungary, and Poland, although such a model agreement was signed by Romania in April 1991. Most former member states of the Warsaw Pact have later joined the North Atlantic Treaty Organization (NATO).

Another significant event in Europe's history that took place at the end of the past century was the Third Balkan War. This war can be seen as one long conflict divided into at least nine separate wars, rebellions, and uprisings, all of which involve parts of the disintegrated Yugoslavia. The first war, which was called the Yugoslav Civil War, took place in 1991–1992. The breakup of Yugoslavia also involved two separate but related wars in Slovenia (1991) and Croatia (1991–1995), which

Map of Europe.

declared independence from the Belgrade government. Slovenia's war against the Serbian-dominated Yugoslav Army was short and victorious. Croatia

fought both the Yugoslav/Serbian Army and Serb rebels in the Krajina region. In May 1995, the Croatian Army launched an effective offensive

(Operation Storm), which forced an end to the Krajina Republic. The Bosnian Civil War followed in 1992–1995. It involved Croatia, Yugoslavia/Serbia, and NATO. After NATO's air strikes against the Serbs (from August 30 to September 14, 1995), Bosnian Serbs agreed to end the fighting and participate as a part of the Bosnian nation. The latest conflicts were the Kosovo War of 1998–1999 (started after the ethnic Albanians living in the Serbian province of Kosovo sought independence from the Yugoslav Serb government in Belgrade), the Presevo Rebellion of 2000–2001 (rebellion by ethnic Albanians living in the Presevo Valley region of Serbia), and the Albanian Uprising in Macedonia, which began in March of 2001.

Events that intervened during the past decades significantly increased the role of the military alliance of NATO and led to its enlargement. Since 1949, NATO's membership has increased from 12 to 28 countries through six rounds of enlargement in 1952, 1955, 1982, 1999, 2004, and 2009. The enlargement of NATO contributed to the consolidation of stability and security for all countries in the Euro-Atlantic area by encouraging and supporting democratic reforms, including the establishment of civilian and democratic control over military forces; fostering patterns and habits of cooperation, consultation, and consensus-building characteristic of relations among members of the alliance; and promoting good-neighbor relations.

Another organization whose enlargement had a very large impact on the recent events in Europe's history was the EU (founding countries were Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany). The first three enlargements brought in six more countries (Denmark, Ireland, and the United Kingdom, 1973; Greece, 1981; and Spain and Portugal, 1986) to the European Economic Community (as the EU was called until the Treaty of Maastricht), thus strengthening its presence in northern and southern Europe. The Treaty of Maastricht (signed in 1992) represented a new stage in European integration since it opened the way to political integration and created the EU consisting of three pillars: (1) the European Communities, (2) the Common Foreign and Security Policy, and (3) police and judicial cooperation in criminal matters. New European dynamism and the continent's changing geopolitical situation led Austria, Finland, and Sweden to join the EU in 1995.

The fifth enlargement took place in 2004, when 10 more countries (the Czech Republic, Hungary, Poland, Slovakia, Estonia, Latvia, Lithuania, Slovenia, Cyprus, and Malta) joined the EU. Bulgaria and Romania joined the EU in 2007, bringing the number of EU countries to 27. The addition of 12 more countries did not simply increase the EU's geographical size and population but also its political and moral dimensions in terms of culture, history, and aspirations as new member states joined or returned to the democratic European family. It is expected that this process will continue further; at present, Croatia, Turkey, and Macedonia are official candidate countries holding (or planning to start) the accession negotiations. All the other western Balkan countries (Albania, Bosnia and Herzegovina, Montenegro, Serbia, as well as Kosovo) are potential candidates. Recently (July 2009), Iceland also submitted an application for EU membership.

The Treaty of Lisbon (ratified in 2009) provides the EU with modern institutions and optimized working methods to tackle efficiently today's challenges, such as globalization, climatic and demographic changes, security, and energy. However, the EU is unlikely to become a "superpower" in the political arena in the short run: Questions regarding budget concerns, the ability to formulate a common foreign policy, and energy problems, as well as the issue of the euro system, remain extremely difficult to agree on and to solve. On the other hand, the EU plays a very significant role in economic, trade, and monetary terms, and in all probability it will preserve this role in the foreseeable future.

Security Challenges and European Response

As indicated in the European Security Strategy (agreed in 2003), Europe has never been so prosperous, so secure, and so free as it was in the beginning of the 21st century. Nevertheless, Europe faces a lot of security challenges. Although large-scale aggression is unlikely, Europe faces threats that are more diverse, less visible, and less predictable. One such threat is terrorism, arising out of pressures of modernization, cultural, social, and political crises, and the alienation of young people living in foreign societies. Some of the groups involved in terrorist activities are related to European issues (like ETA Basque terrorism), others have nonterritorial leftist-centered ideologies or are radical Islamist groups.

These groups originating in North Africa, Pakistan, and Arab countries have already staged mass attacks in Spain, the United Kingdom, France, Germany, and Italy. This radical Islamist threat, combined with what is commonly called “homegrown” terrorism, challenges the various European states and the EU at large (in the United Kingdom, Ireland, and Spain, terrorist attacks caused 5,000 deaths in 30 years).

Since Europe is one of the two richest parts of the world, it is a prime target for organized crime originating outside Europe. State failure is also an alarming phenomenon that undermines global governance and adds to regional instability. The international treaty regimes and export control arrangement have slowed the spread of weapons of mass destruction. However, Europe is entering a new and dangerous period that raises the possibility of a weapons-of-mass-destruction arms race, especially in the Middle East. Advances in the biological sciences may increase the potency of biological weapons in the coming years. Many border areas of Europe are torn by regional conflicts that represent a large threat to Europe. New unconventional and asymmetrical threats (like possible energy supply disruptions, cyber attacks, etc.) are also challenging European security.

In addition to the NATO enlargement and the EU integration policies, security challenges in Europe are tackled by developing a range of EU policies. For instance, in 2006–2007, the EU also started working on a common energy policy, the aim of which is to negotiate energy more effectively as a united bloc, while diversifying supply and promoting competition to ensure security and sustainability of energy supplies. Prior to that, in 1999, the European Security and Defense Policy was launched, stressing the need to create an efficient decision-making mechanism and to enable the EU to act independently in solving international crises. The Treaty of Lisbon has reshaped the European Security and Defense Policy into the Common Security and Defense Policy, which allows the EU to develop its civilian and military capacities for crisis management and conflict prevention at the international level. The Common Security and Defense Policy does not involve the creation of a European army; therefore, it develops in a manner that is compatible and coordinated with NATO. It is worth mentioning that the EU and NATO agreed on mutual crisis consultation arrangements that are geared toward efficient and rapid decision making in each organization in the

presence of a crisis. If a given crisis gives rise to an EU-led operation making use of NATO assets and capabilities, the EU and NATO will draw on the so-called Berlin Plus arrangements. These arrangements cover three main elements: (1) EU access to NATO planning, (2) NATO European Command options, and (3) use of NATO assets and capabilities.

There is a growing demand for European governments to send armed forces on a wide range of expeditionary missions. From the Balkans conflicts of the 1990s onward, the number of European personnel deployed abroad has risen steadily. The requirement for more deployable forces is unlikely to be temporary. However, the European architecture for crisis management and its operational capabilities do not yet fully meet the needs dictated by the ambitious strategy defined in various EU planning documents.

European armies have been slow to acquire some of the military equipment necessary to engage in high-end warfighting and force projection that the EU would need in order to shoulder wider global responsibilities. In defense capability, there is a huge gap between the French and British on the one hand and the rest of the EU on the other. Britain and France remain the two big defense players in Europe. Apart from Britain and France, most European militaries have failed to keep up with technological advances in battlefield management and communications. They train their forces to defend largely unthreatened borders at home, leaving them unwilling and unprepared to defend common interests abroad, from Afghanistan to Libya.

The war in Libya in 2011, far from heralding a new era of European activism, once again highlighted the limits of Europe’s military power. While every NATO alliance member voted for the Libya mission, less than half participated, and fewer than a third were willing to participate in the strike mission. Frankly, many of those allies sitting on the sidelines did so not because they did not want to participate, but simply because they couldn’t. The military capabilities simply weren’t there. Even Britain and France skimped on munitions, which made it hard for them to carry out multiple missions (both are also fighting in Afghanistan).

The need to do more with less has put European governments under pressure to identify the capabilities that they require for modern missions and to carry out reforms. Several European countries say explicitly that they no longer perceive direct threats

to their sovereignty, and therefore, they organize their armed forces to deal with a wide range of contingencies, both abroad and at home. Clearly, this perception does not apply to everybody, since some countries, especially in eastern Europe, do still see possible territorial threats. Although there have been budget cuts in defense, Europe's potential to influence international security issues through military power remains significant. It has plenty of military assets to draw on for operations.

Compared with the United States, Europe lacks capabilities to project military power, and its technological base is inferior. Its forces are not interoperable with the United States, and its military doctrines are increasingly divergent, as the United States has successfully tested new concepts of warfare in Afghanistan and Iraq, while Europe lacks a debate about new methods of using armed force. European countries require a wide range of capabilities, some of which are still quite new. The driving need is to create forces with the right mix of skills, training, equipment, doctrine, and support systems, as well as being able to deploy rapidly far afield and be sustained over extended periods of time. For cultural, political, and budgetary reasons, Europe is unlikely to close the gap within a decade or so.

To sum up, despite impressive agreements and commitments, no European country possesses sufficient financial, industrial, or technological resources necessary to effectively sustain these kinds of adaptable military tool kits. The current financial crisis further accentuates this fact. Mounting pressures over defense budgets and an increasingly complex and uncertain security environment call for renewed efforts in European defense cooperation. European armed forces must develop capabilities that allow them to perform a wide variety of tasks—from high-intensity combat to constabulary duties and state-building.

Civil-Military Relations in Europe

In essence, all European countries pay great attention to improving civil-military relations. This is done by strengthening subjective and objective civilian control over the militaries (subjective civilian control focuses on maximizing civilian power, objective civilian control focuses on maximizing military professionalism) in four dimensions. First is the relationship between the military and the state.

The European norm here is that armed forces are unambiguously subordinate to the lawfully elected government in office, and the armed forces' leadership has no voice in public affairs beyond its professional domain. It is typical in Europe that although the head of state is usually its military's nominal commander in chief, the military owes its allegiance to the state, not the government of the day. As a consequence, when power legitimately changes hands, the armed forces dutifully serve their new political masters.

The relationship between the military and the executive branch of government is another important dimension of civil-military relations. Typical European practice is firmly and unambiguously to require subordination of the armed forces under civilian political direction. In advanced democracies, such "control" is normally exercised not by the head of government personally but by a departmental minister (usually the minister of national defense, though chiefs of staff may have a right of direct access to the prime minister in certain circumstances, e.g., as they do in the United Kingdom). In the EU, such "control" is much more than nominal: In matters of defense policy making, planning, programming, budgeting, and spending, the authority and autonomy of the military are strictly circumscribed. This means that, as a general rule, even in operational matters militaries do not have complete freedom of maneuver; military officers do not make public statements (even senior military officers and even on comparatively uncontroversial security-related matters) without the express authorization of their minister, and so forth.

The third dimension of civil-military relations is the role of the parliament and commitment to transparency. Policy accountability (obligation to reveal, explain, and justify what is done) and financial accountability (obligation to justify what is spent) are of central importance in this regard. On the other hand, it is the parliament's responsibility to hold government to account in both ways. The relationship between the military and a country's domestic security community of analysts, academics, journalists, interest groups, and other civil society organizations is a complementary fourth dimension of civil-military relations. Here, too, transparency is of the essence. Finally, the term *civil-military relations* extends to embrace the relationship between the military and society at large. Patterns of recruitment

and resettlement, the organization of military education, the extent of military aid to the civil community, popular attitudes toward the armed forces—these and many other factors determine that in general the armed forces in Europe are well integrated in society and do not exist as “a state within a state.”

The U.S.-EU Relationship

The relationship between the United States and Europe constitutes the world's strongest, most comprehensive, and strategically most important partnership. This relationship can be characterized by several features. First, the underlying feature of the transatlantic relationship is an economic relationship. On the government-to-government level, the United States and the EU work together to bring about a convergence in their respective regulatory regimes to multilateral trade negotiations. In light of economic and financial crisis, improvement of trade relations is of crucial importance.

Talking about Europe, many countries are experiencing troubles due to excessive sovereign debt. The eurozone's (countries that have adopted the euro as currency) sovereign debt problem emerged in 2010 first in Greece, but it was followed by problems in Ireland, Portugal, Spain, Italy, and Cyprus. The debt crisis that began in Greece and spread to other eurozone countries has served as a painful reminder of the risks associated with high public debt in a globalized financial system. The standard explanation for the problems in, for instance, Greece is that lack of effective monitoring of government deficits within euro area countries and lack of enforcement of the rules on how much debt a country can have allowed excessive debt levels to accumulate. In other cases, such as Spain, the problem was not irresponsible budget behavior; it was the recession that caused the government budget to collapse.

The EU policy response was to provide a fund for the problem countries to guarantee debt repayments. To convince financial markets that the weaker members of the single currency would not be abandoned, on May 10, 2010, European ministers produced a rescue package for the eurozone. The scale of the response reflected growing fears among European leaders that financing for the most troubled eurozone countries might suddenly stop. Although the package has bought the troubled currency area time, it does not resolve the underlying structural difficulties facing many of its members, particularly the

following five: Portugal, Ireland, Italy, Greece, and Spain.

It is worth noticing that the fallout of the eurozone's financial crisis is beginning to be felt elsewhere. Bailing out countries that have serious solvency problems threatens the stronger European nations that are trying to rescue them. Banks in Germany and France that have lent massive amounts to Greece, Portugal, and other struggling economies are beginning to teeter. Fears are growing that taxpayers in richer nations like the Netherlands will be bailing out poorer ones. To sum up, the near future may not bring much relief for countries like Spain, Greece, Ireland, and Portugal, or for others such as Belgium and Italy, which also have huge debt.

The second feature of cooperation between the EU and the United States is political cooperation. Unlike the economic sector, this relationship is basically an unequal partnership because of the EU's structure and the competences mainly remaining in the member states. Nonetheless, an intense dialogue takes place around efforts to enhance democracy and freedom and to promote security. In a number of instances, the common U.S.-EU effort has been critical, notably, negotiations with Iran over its nuclear program and the Middle East peace process. In addition, combined efforts have a measure of success in several other areas like Afghanistan, the Balkans, Lebanon/Syria, Sudan, and Ukraine.

The third feature is issues of potential conflict. One of the conflict areas between the United States and the EU is relations with Russia. For some time, Russia has openly challenged the United States and is playing hard in Europe over its energy supplies, the security of which is a critical issue for the EU (as a large part of the energy supply and especially gas originate from Russia). On the other hand, the United States and Russia seem to be in conflict, with Europe stuck in the middle and unwilling to take a geopolitical view of either player. In this regard, a number of European countries like Germany, France, and others argue that Russia is an indispensable interlocutor to ensure Europe's long-term stability and have consequently favored a policy of engagement over confrontation. Thus, western Europe treats Russia as if it were a developed industrialized country with a democratic political structure and an emerging civil society. The Obama administration has also shown a willingness to defuse tensions with Russia and concentrate on overlapping interests. However, the EU member states from central and eastern Europe,

which endured decades of Soviet rule, feel far more threatened by an increasingly assertive and aggressive Russia. According to them, Russia sees the obvious weakness in transatlantic relations and is seeking to take advantage of it. The U.S. government cannot ignore those concerns as well.

Another area of disagreement between the United States and the EU is the enlargement of the EU, particularly the membership of Turkey and most of the Balkans. The United States remains a strong proponent of enlargement to include these countries; however, this issue is particularly sensitive for the EU. The Turkish government is criticized by the EU because it has not yet adopted a single reform of the political program, and there is also no progress in the development of civil society and parliamentary control to oversee the army and defense policy.

F

FAMILY, MILITARY

Military families—the spouses and children of members of the active-duty, National Guard, and Reserve forces—are an important part of the military community. In popular culture, military families are often portrayed as flexible, self-reliant, and adventurous, but the military lifestyle can be demanding and stressful for families. The recruitment, readiness, and retention of military personnel are affected by the living conditions and overall satisfaction of military families. Not surprisingly, during the era of the all-volunteer force (AVF), and especially after the attacks of September 11, 2001, the needs and concerns of military families have received a great deal of attention from the Department of Defense (DOD). Any widespread and prolonged crisis in the military family could affect national security. This entry describes the benefits and support available for military families and discusses the challenges faced by them.

The military sociologist Mady Segal has called the family a “greedy institution” competing with the military—another “greedy institution”—for the attention and energy of its personnel. The military lifestyle requires that families contend with circumstances that are quite challenging: frequent moves, financial hardship, the social pressure of living in a small community where work and family life are intertwined, extended absences of the service member, and, not least, the ever-present potential for physical harm or even death in battle.

On the other hand, military families receive benefits and support that civilian families do not.

The military provides a variety of free or low-cost services, including housing, child care, and health care, which mitigate financial and emotional stress, and the military community can be a source of social support. Many military families enjoy the opportunity to live in different countries, and most military families travel extensively. Children of service members, “military brats,” as they are sometimes called, learn to interact easily with many different types of people. Studies show that military children are especially close to their mothers, who are usually responsible for moving and helping the family readjust to each new home. Life in the military can be a great adventure for those who can adapt successfully.

Military officers and career soldiers have always had spouses and children, but the all-volunteer force includes more families than ever before. Military personnel are more likely to be married at younger ages than their civilian peers; of a total 1.9 million active-duty service members, 52% of enlisted personnel and about 70% of officers are married. They are also more likely to have children; among all the services, including the Reserve and National Guard, 1.9% children below the age of 18 have a military parent, and 765,000 children have at least one parent on active duty. There are almost 154,000 single parents in the military and 75,000 children with single parents on active duty. About 8% of married personnel in the military are dual-career couples. Women make up approximately 15% of all personnel in the services. However, about 93% of military spouses are female, and most of them are civilians.

In 1993, General Carl E. Mundy, the commandant of the U.S. Marine Corps, proposed a plan to

phase out married recruits in the U.S. Marine Corps. Amid great uproar, he was forced to abandon the plan, but his concerns about the burden of family responsibilities on young marines echo traditional thinking. The saying "If the Army wanted you to have a wife, it would have issued you one" is an old cliché that reflects the reality that wives and families must fit into the military mission.

Historical Precedents

Throughout most of the U.S. military's existence, families were viewed as camp followers who provided a variety of services. Officers' wives organized post social and cultural life, while wives of enlisted men worked as servants, nurses, and laundresses. No provisions were made for families in terms of transportation or housing. Officers lived in quarters on post, assigned only by rank, not family size. "Ranking out," the system in which an officer of a higher rank could evict a lower ranking officer from his quarters, was ubiquitous on frontier posts, and families with children could be forced to turn over their quarters to a bachelor officer. Some wives of enlisted men worked as laundresses and received rations, but they lived in run-down shacks on the edge of the post, often known as "soapsuds row." Other enlisted families lived in casements, the thick walls of coastal forts, or fended for themselves in the nearest town while the soldier lived in the post barracks. Transportation was a particular financial burden for military families. During the late 19th century, railroads sometimes provided free transportation for military families traveling to and from western posts, but this was a favor, not an official policy, and military families usually had to pay their own transportation costs. On frontier posts, schools for children were organized informally by the commanding officer or an enterprising wife. Teachers might be enlisted men, wives, or civilian women hired for the purpose. Life for families on frontier posts could be rough, but most families recalled a strong sense of community and frequent adventures. Wives organized dances, holiday feasts, picnics, and other social events. Children went hunting and riding and, sometimes, even accompanied their fathers into combat.

The Spanish-American War and the acquisition of colonial possessions in Cuba, Hawaii, Panama, and the Philippines meant that military families were assigned to posts not just on the western frontier but

throughout the world. Families took steamers to the Philippines as early as 1899 and 1900, even as combat continued. They faced expensive travel and inadequate housing, although some services, such as elementary schools, were organized on a more formal basis. In the early 20th century, social life for officers and their wives became more elaborate, with endless rounds of cocktail parties, bridge, dinners, and formal balls. Family members took the opportunity to visit Japan and China while stationed in the Philippines.

When the United States entered World War I, wives schemed to find some way to get to France to be near their husbands, although the military discouraged it. Some tried to join the Red Cross. This was the first time that wives were not allowed to join their husbands in a combat zone, although they joined their husbands in Germany during the post-war occupation.

The Second World War brought many more families into the military community, which up to this point had been small, insular, and multigenerational. After the war was over, the Allied forces occupied Germany, Japan, Austria, and South Korea, and in 1946, family members were encouraged to move to the occupation zones. The policy allowing military families to live in Europe and Asia was intended to tame the wild barracks atmosphere that was hurting relations with the civilian population and damaging the health of the men and to show the world that the United States would remain an active leader in global affairs. Many servicemen married European or Asian women while stationed overseas.

As a worldwide garrison force, the military began providing housing and shopping areas, schools, health care, and recreation facilities for families. After the war, military couples, like their civilian counterparts, began having children; in 1947, the first military babies were born overseas, and military children soon added to the baby boom. In garrison communities, whether overseas or in the United States, wives organized the social life of the base and of the unit and performed many types of volunteer work. The postwar decades saw the creation of numerous wives' clubs and organizations, and the social performance of wives became a factor in promotion decisions for service members, particularly officers.

During the Vietnam War era, living conditions for military families worsened to the point of crisis, as base facilities deteriorated, military pay failed to

keep up with inflation, and veterans returned home physically and emotionally disabled. In 1973, the unpopular draft was abolished and the era of the all-volunteer force began, but military life continued to decline. Families were forced to use food stamps and other government assistance to supplement their meager incomes, and officials described base housing as “slum-like.” Clubs and organizations became less active or lapsed altogether, as women entering the workforce viewed the duties of a military spouse as burdensome.

By the late 1970s and early 1980s, retention experts realized that poor conditions for families were a retention challenge, and the services began to improve conditions for military families. Reforms included significant pay raises, modernization of housing and schools, and more attention to the needs of military families. At the end of the Cold War, many installations were closed and the military downsized, but the September 11 attacks brought a renewed urgency to military affairs. The new force posture affected military families as service members were deployed, sometimes multiple times, to Iraq and Afghanistan. The defense posture of the future projects an expeditionary force model in which most families live on or near large posts in the United States while personnel are deployed overseas. This model is traditional for naval personnel and their families, but for personnel and families of the U.S. Army, Air Force, and Marine Corps, it will represent a significant departure.

Current Challenges

Much of the literature about military families begins with an often unspoken assumption that the military lifestyle is difficult and stressful and that military family life is especially prone to dysfunction. In 2005, for example, a spate of news sources reported that the divorce rate among military personnel was skyrocketing due to stress caused by deployment. More careful research showed that the apparent spike in divorce was a statistical fluke and that deployment actually decreased the likelihood of divorce, although families and personnel perceived deployment as stressful to the family. However, exposure to combat and posttraumatic stress disorder did prove to be risk factors for divorce.

Deployment does place particular stress on children, and children whose parents are deployed

show increased levels of anxiety. Difficulties for children are exacerbated when they live off-post and attend civilian schools, because military children often feel isolated and misunderstood in the civilian world. Reserve and National Guard families are also at higher risk for deployment-related stress, and when the civilian parent has difficulty adjusting to the deployment, stress on the child increases. Interestingly, the greatest stress for military families comes not when the service member is away, but after he or she returns home. Families report difficulty in reintegrating the returning service member into family routines and roles. However, studies suggest that military children do not experience elevated levels of dysfunction in school or social relationships, and deployment-related anxiety diminishes or disappears when deployment is over.

Employment is another challenge for military spouses. Military wives are better educated than the general female civilian population—84% have at least some college, 25% have bachelor's degrees, and 10% have advanced degrees. Unfortunately, while most are working or want to work, military spouses experience more unemployment and underemployment than civilians. The wage gap between military wives and civilian women is as high as 40% due to frequent moves, lack of high-paying jobs in the surrounding area, and child care issues.

In recent decades, the Department of Defense has established a large number of support programs and services to meet the needs of military families, but there has been frequent skepticism about the effectiveness and sincerity of these efforts. In 2011, the Obama administration created a comprehensive plan to support military families that included four priorities: (1) to “enhance the well-being and psychological health of the military family,” (2) to “ensure excellence in military children's education and their development,” (3) to “develop career and educational opportunities for military spouses,” and (4) to “increase child care availability and quality for the Armed Forces.” Fifty federal agencies have committed to participating in efforts to strengthen military families.

Support programs for military families are influenced by two hypotheses about military family life. The “stress hypothesis” suggests that military life is more difficult than civilian life. The “selection hypothesis” proposes that the military attracts recruits who are more likely to have vulnerable families, because

of risks including age, socioeconomic status, education levels, ethnicity, and other demographic factors. Research needs to continue to determine which of these hypotheses better explains the stresses that military families experience, so that programs and services can be more accurately targeted.

FAMILY READINESS

Military family readiness programs are initiatives from the Department of Defense intended to create and maintain high levels of morale throughout the military community, especially among military family members. Their objectives are to build a sense of cohesion through social activities, share accurate news and information, help families prepare for deployment and reunion, inform families about available programs and benefits, and help families get the assistance they need in times of crisis. Family readiness programs exist at all levels of the military, but they operate at the unit level. The purpose of family readiness programs is to strengthen the competence and happiness of the families of the unit,

enabling service members to concentrate on their missions free from domestic worries, and to allow commanders to share the burden of dealing with difficult family problems. This entry examines the history and features of these support programs.

For at least the past decade, family readiness programs have been command-sponsored and funded through congressional appropriations, rather than through funds raised by the community itself. Although these two characteristics of family readiness programs support the contention of the Department of Defense that the groups are vital to the mission of the armed services, at the unit level, family readiness programs continue to be staffed by volunteers, usually spouses of military personnel. The volunteer aspect of the programs has the advantage of increased user involvement, but it also means that the quality of individual programs varies widely; moreover, local leaders are often expected to handle serious problems with little or no professional training in social work or counseling.

Family readiness programs have been established by all branches of the military, both active duty and Reserve/National Guard, and in all major commands. Since the Persian Gulf War of 1991, there has been a great deal of attention paid to family readiness, partly as a result of the stresses resulting from that conflict and partly in response to several longer term changes inside and outside the armed forces. First among these is the 1973 transition from the post–World War II draft to the all-volunteer force. After several decades of existence, the all-volunteer force is a professional military force that includes a high percentage of older, career personnel with spouses and children. The tendency of military personnel to be married can be seen even at the junior enlisted level; in fact, military family members outnumber military personnel by about one third. Military personnel with families often find their attention divided between their military mission and their responsibilities to their families. Family stress is a common cause of attrition, something commanders try to avoid.

A second long-term change involves the military moving from a worldwide garrison force in which families are stationed with their sponsors overseas to a stateside-based force in which personnel are deployed to forward locations while families stay home. This change in basing policy means that families have to be prepared to spend much of their lives

separated from their sponsors. Such a system cannot work well unless the families are educated and prepared to deal with the strains and challenges. Finally, military families in today's armed forces are more diverse than ever before, in terms of ethnicity, family background, education levels, and career goals. All branches of the service have seen growth in the numbers of dual-career military families, international military spouses, and male military spouses. Commanders can no longer assume that military families will enter military life with the same expectations and skills that they may once have had.

The comprehensive family readiness programs of today are the culmination of almost a century of gradually increasing support for military families. In the 19th century, military families were not officially acknowledged or supported by the War Department, with the exception of army laundresses (War Department employees who were often the wives of noncommissioned officers). However, officers' wives did often accompany their husbands to posts all over the United States and in the Pacific, and wives assumed most of the responsibility for social and community life on posts. In the early 20th century, after the Spanish-American War revealed scandalously poor preparation for a large-scale conflict, the Army Relief Society was organized by officers' wives and wealthy philanthropists to raise money to help the widows and orphans of soldiers who had died. During the decades before World War II, officers' wives began organizing social clubs and charitable groups on posts, but it was only during the early Cold War that the armed forces began organizing as a worldwide garrison force, building large bases with family housing, schools, hospitals, and recreation facilities for military families, officially integrating military families into the installation system.

During the 1950s and 1960s, a plethora of clubs and social organizations grew on military bases throughout the world. Members, mostly women, socialized, did charity work, and provided various types of support for the wives and children of enlisted personnel and junior officers. Almost all of this work was unpaid labor, but officers' wives, especially at the command level, were expected to participate. Officers' Evaluation Reports included discussion of a wife's social and charitable activities, and, in theory at least, an officer could lose promotion because of his wife's unwillingness to assume leadership in clubs and groups.

During the Vietnam War, the armed forces cut back on many services for families, and military family life became more difficult and unpleasant for many families. Poverty among junior enlisted families increased, and by the 1970s, the social support network that had existed in the first decades of the Cold War began to fray as more women worked outside the home, leaving less time for volunteer activities. At the same time, benefits and programs for families increased and became more complex, a result of the all-volunteer force. Department of Defense surveys in the early and mid-1980s revealed that military families needed better information about what was available to them and showed that family stress was a leading cause of attrition. By the 1990s, the armed forces began to establish more formal family readiness programs as a way of helping families navigate the complexities of military life.

The recent shift from a global garrison force to an expeditionary force model has necessitated much greater support for families, who now face years of long separations and temporary reunions. The family readiness programs of today are designed largely around deployment issues, in contrast to past efforts that emphasized the challenges of frequent moves. For example, family readiness programs offer workshops on organizing finances and legal matters in preparation for deployment, effective communication during deployment, and the challenges of reunion and reintegration.

Family readiness programs have been criticized as being merely a public relations ploy, or for their expectation that family members, mostly women, will do hours of unpaid work each week. However, it does appear that every branch of the armed services has coordinated and professionalized its family readiness programs to a greater extent than ever before. Group leaders have more resources and training available to them, they have funding and command support, and, if successful, they serve an enormously important service to military families.

FEDERAL BUREAU OF INVESTIGATION

On its website, the Federal Bureau of Investigation (FBI) proclaims its mission:

to protect and defend the United States against terrorist and foreign intelligence threats, to uphold and enforce the criminal laws of the United States, and to provide leadership and criminal justice services to federal, state, municipal, and international agencies and partners. (www.fbi.gov)

It also lists “Priorities,” in which “we will produce and use intelligence to protect the nation from threats and to bring to justice those who violate the law.” First under “Our Core Values” comes “rigorous obedience to the Constitution of the United States,” meaning among other things, protection of civil rights and liberties. Wartime presents the greatest challenges to balancing the FBI goals of protecting both security and civil liberties. As the nation’s major federal domestic intelligence agency as well as its major federal investigator of crimes, the FBI faced these challenges almost from its inception as the investigative arm of the Department of Justice (DOJ) in 1908 continuing into the present. This entry focuses on the role of the FBI during wartime.

Background

During the earliest years of the Bureau of Investigation (BOI), as it was first named, the United States had few federal criminal statutes. The law relevant to the earliest war involving the BOI, the Mexican Revolution of 1910–1916, concerned neutrality violations—recruiting and arms and ammunition smuggling. The U.S. government, despite its official neutrality, often chose sides, usually favoring the incumbent government over various rebel factions. Severely hampered by budget constraints, the few BOI agents relied on Mexican intelligence, private American operators, and border communities for information. Individuals with mercenary interests, including double agents,

sided with whoever paid the most. El Paso, Texas, became a center of intrigue along with its Mexican counterpart, Ciudad Juarez. The BOI and later the FBI used the intelligence techniques developed along the Mexican border throughout future U.S. hot and cold wars. For example, Western Union and the U.S. Post Office provided the BOI with copies of telegrams and envelopes (mail covers). BOI agents also planted “bugs” to overhear conversations even where they had to break into private property to plant them, a technique used during the Cold War as “Black Bag” operations.

World War I

Neutrality continued to be the major federal law associated with war from 1914, when World War I broke out in Europe, until the United States declared war in April 1917. Espionage (1917) and sabotage (1918) became federal crimes only after the U.S. war declaration, and the BOI was strictly limited to investigating federal law violations. During neutrality, the BOI’s failure to arrest propagandists and spies subjected it to ridicule by the press. When the BOI, after being granted special authority, investigated a munitions explosion at New Jersey’s Black Tom railroad yard and identified the perpetrators, it received no credit. However, the 1917 and 1918 laws gave the BOI new powers, and by the war’s end, the BOI had arrested more than 900 suspects.

With the United States at war, President Woodrow Wilson revived the 1798 Alien Act and put the BOI in charge of regulating alien enemies, primarily Germans and Austrians. The BOI used the Espionage Act to surveil individuals, regardless of citizenship, whose words or actions raised suspicion. In 1917 and 1918, the bureau had only 300 to 400 agents nationwide. Therefore, it officially associated with the American Protective League (APL), citizens pledged to identify suspected spies, saboteurs, and “slackers” (draft dodgers). War needs fed labor unrest, and violence occurred on both sides. The BOI and the APL joined the army, immigration authorities, and vigilantes in their largely successful efforts to destroy the unions. In 1918, the APL conducted well-publicized slacker raids in major cities, rounding up males of apparent draft age not carrying their registration cards. The vast majority actually had registered, but many were kept in incommunicado in crowded conditions awaiting an opportunity to prove their innocence. The raids discredited the APL and BOI

in some cities. After the armistice (November 1918), the wartime BOI director, A. Bruce Bielaski, reduced the agent force and dissolved the BOI's association with the APL in January 1919. To Congress, Bielaski described the Bureau's wartime function as "giving the public a feeling of security." That purpose would continue in subsequent wars.

World War II

With the onset of World War II in 1939, neutrality laws again became a justification for operations by the renamed (1935) Federal Bureau of Investigation. President Franklin Roosevelt in 1936 had secretly authorized the FBI to investigate subversive activities by foreign governments. Using that authority after 1939 and continuing through the war, the FBI used warrants to investigate suspected German, Italian, and Japanese operatives.

The German intelligence agency, Abwehr, sent its spies into the United States from at least the mid-1930s. To the Abwehr, William Sebold, a German-born U.S. citizen with an American wife, seemed a perfect spy. After training in Germany, he was to establish a radio transmitter and collect information from German spies run in the United States by Fritz Duquesne. Sebold agreed but informed the FBI on his arrival in the United States. The bureau set up his radio and sent false information laced with enough true transmissions to appear credible. Moreover, the FBI filmed Sebold's contacts with the spies. Only when Sebold testified against the Duquesne ring in September 1941, was his true loyalty revealed. The convictions helped solidify the reputation of the FBI and its director, J. Edgar Hoover, for the American public.

Hoover's public reputation, however, was insufficient to prevent the removal of Japanese and Japanese Americans from the American west coast. With Roosevelt's 1936 directive, bureau agents using radio and cable intercepts, interviews, and searches of homes and offices investigated suspected foreign and communist spies. For example, an FBI and military search of homes on Terminal Island, California, where the Japanese fishing fleet docked, netted code books and communication equipment that might have been used to contact Japanese submarines. The FBI had identified several thousand suspected spies and "subversives" by the time the Japanese attacked Pearl Harbor, December 7, 1941, prompting the U.S. declaration of war. In the next few days, the

TAKE SLACKERS INTO ARMY.

Many at Camp Dix Welcome Induction Into Military Service.

Special to The New York Times.

CAMP DIX, WRIGHTSTOWN, N. J., Sept. 9.—By direction of Federal authorities, several hundred prisoners captured in North Jersey slacker raids last week and sent to this camp are being inducted into military service today as rapidly as a special detail from the mustering office can handle them. In a few cases where the prisoners had deferred classification but could not find their cards, they are being assigned as soon as their records are established. About 8 per cent. of the prisoners, it is said, are found to have been deliberate slackers who evaded registration.

While Department of Justice agents were under instructions to have all prisoners inducted into service by their local boards before they were sent to camp, several of the prisoners came through without this procedure. An unusually high percentage of the prisoners will eventually be discharged on physical grounds, it is asserted.

A strange feature of the situation is the fact that a majority of the members of the party seemed highly pleased this afternoon over the prospect of getting in the army. Even some of the wilful slackers admit they grew tired of the apprehension of capture and that their arrival here is a real relief.

The *New York Times* article about the "slacker raids" being conducted by the Bureau of Investigation, September 9, 1918.

government detained suspected German, Italian, and Japanese spies. The FBI also acquired significant information by breaking into a Japanese consulate. By February 1942, the bureau, with the army and navy intelligence concurring, concluded that all dangerous Japanese had been identified. Hoover also contended that in future suspect individuals

The FBI's fingerprinting work grew so massive during the war that it had to be moved to a federal armory larger than a football field.

would be identified and detained. Mainly for these reasons, FBI director Hoover formally objected when Secretary of War Harold Stimson insisted that all Japanese and Japanese Americans should be removed from the U.S. west coast and sent to camps further east. President Roosevelt overruled Hoover with Executive Order 9066.

Significantly contributing to the American war effort, the FBI developed the supersecret Special Intelligence Service authorized by President Franklin D. Roosevelt on June 24, 1940. The Special Intelligence Service consisted of FBI agents working undercover as representatives of banking, investment, and business interests in Central and South America. Usually single, they learned Spanish or Portuguese, trained in the States in their cover

business to seem credible, and learned spycraft-like secret writing and codes. The Special Intelligence Service was so secret that its agents hid their identity from other agents and even Congress did not know it existed. Their informants included local police (who made arrests) and anti-Axis individuals, like the members of Argentina's Jewish community. By the time the war ended in 1945, these bureau spies helped shut down the South American Abwehr radio system and caused the arrest of suspected Germans.

The Early Cold War

The Soviet Union had been an American ally during World War II. But it soon became the greatest enemy of the United States in its quest for communist world

domination. In 1949 it exploded an atomic bomb, thus making it an even deadlier enemy. The Cold War for the FBI occurred in two phases: the first from 1946–1961, which included the Korean War (1950–1953), and the second, which lasted until the fall of the Soviet Union in 1991. The FBI's early war against communists had two separate but simultaneous aspects: (1) investigating and arresting suspected spies and (2) tracking—and in some instances arresting—suspected subversives who allegedly supported violent overthrow of the U.S. government.

Some of the FBI's best known (and most controversial) Cold War espionage investigations involved individuals who spied for the Soviets during World War II, like Alger Hiss, who was convicted of perjury when the statute of limitations on espionage ran out, and Julius and Ethel Rosenberg, who were executed for giving atomic secrets to the Russians. The FBI first learned of these and many other spies through decrypted and translated Soviet documents known only to a handful of Americans. Under the rubric "Venona," these decrypts pointed to hundreds of code-named individuals, mostly in the U.S. government, who passed information to Russia. One of the first identified was, then, a current Justice Department employee, Judith Coplon. The FBI agent in charge of her case, Robert Lamphere, received permission from President Harry Truman's attorney general, Tom Clark, to put her under surveillance and tap her home and office telephones. Since Roosevelt in 1940, presidential directives permitted wiretapping in cases of "grave matters involving the defense of the nation." Soviet espionage in the 1940s, according to Clark, fits this description. While under surveillance, Coplon passed a document to a Soviet agent, and both were arrested. Juries convicted her in two trials, but various reasons, including the wiretaps, caused a higher court to reverse her conviction. The Venona documents, revealed to the public in 1995, proved the reality and extent of Soviet espionage.

Tracking members of the American Communist Party (CPUSA), considered a Soviet tool, involved many FBI agents during the early Cold War. In connection with President Truman's Loyalty Program, later extended by President Dwight Eisenhower, the FBI instituted a "full-field" investigation whenever "derogatory" information surfaced on an applicant or a government employee. Sometimes the investigation indicated that the only "subversive" association

came from an innocent action, such as purchasing insurance through a suspect organization or having a suspect relative. In such cases, Loyalty Boards, which made the decisions, ruled that the individual was not disloyal. Many others, however, belonged to a communist-dominated union, a "subversive" organization, or the CPUSA itself. According to the historian Ellen Schrecker, the boards cleared 70% to 90% of the cases they heard. At its height, between 1947 and 1956, the boards dismissed approximately 2,700 federal employees for loyalty-security reasons, and some 12,000 resigned.

In addition to investigating government applicants and employees, the FBI tracked members of organizations with alleged ties to the Soviet Union. They were among the individuals on the FBI's Security Index (SI), a list of "dangerous and potentially dangerous" people subject to detention in times of war. The SI covered three levels of communists. First were the 11 leaders who were arrested and convicted for promoting the violent overthrow of the U.S. government. Next came the second echelon individuals who went underground after the Supreme Court upheld the initial arrests in 1951. Last were the ordinary CPUSA members. Because tailing all the individuals was impossible, the bureau often used informants like Herbert Philbrick of *I Led Three Lives* fame to infiltrate the organizations. Philbrick reported on the families and employment of members of his CPUSA club as well as its activities. Other informants merely identified SI people for the bureau. For example, a disabled veteran spent his summer sitting on a front porch across from a Communist Party (CP) member. The veteran reported the license plate numbers of her visitors. Agents conducted their own surveillance as well. Tired and cold outside the home where a meeting took place, an agent knocked on the door saying his car had broken down. He stayed long enough to identify several members of the White Collar Communist Party club. Into the late 1960s, FBI agents periodically checked on their SI charges—in the later years, sometimes in person—to keep the SI up to date, but few arrests of the rank-and-file Communist Party members ever came of the early Cold War surveillance.

The Vietnam War

The Vietnamese conflict (1964–1975) occurred during the second phase of the Cold War. Every war

has its deserters, and in this conflict, as in World War II and Korea, the FBI conducted deserter investigations in conjunction with the military. The FBI often assigned deserters to new agents. According to one agent, the first place to look was home because young soldiers missed their families.

The FBI, however, was most identified with its surveillance of the anti-Vietnam War movement. To Hoover, the antiwar movement represented “a new style in conspiracy—conspiracy that is extremely subtle and devious” characterized “by unrestrained individualism, by nonconformism in dress and speech, even by obscene language,” not by membership in an organization. Although President Lyndon Johnson insisted that communists inspired antiwar riots, Hoover understood that the American antiwar movement was homegrown. Prior to 1968, the FBI surveilled antiwar groups mostly to forewarn the government about demonstrations. But as vandalism, arson, and bombings occurred and campus protests increased to some 3,400 in the 1967–1968 school year, the FBI instituted a secret Counterintelligence Program (COINTELPRO) against this “New Left.” COINTELPROs served to disrupt and discredit their target organizations. The bureau encouraged field agents to inform parents and employers anonymously about the “scurrilous and depraved” (Powers, 2004, p. 279) behavior of their children or employees. FBI informants and undercover agents infiltrated antiwar groups and tracked the leadership using its Rabble Rouser, Agitator, and Key Activist Indexes.

Few of the several hundred thousand people participating in antiwar demonstrations engaged in violence. When mid-1970s congressional investigations revealed the COINTELPROs, the public perceived law enforcement’s surveillance and infiltration as unreasonable breaches of civil liberties. This severely damaged the FBI’s reputation for many years. Yet no court decisions clarified the FBI’s role regarding domestic terrorism until 1972, and the attorney general did not publish surveillance guidelines until 1976. Antiwar activists did more than just damage property. In March 1970, members of a violent faction blew themselves up as they prepared anti-personnel bombs intended to explode in Fort Dix, New Jersey. An antiwar-motivated action also killed a graduate student at the University of Wisconsin, Madison, that August. This 3:43 a.m. explosion aimed at an army research facility was the most

powerful terrorist bomb in the United States until the Oklahoma City bombing in 1995. These were domestic terrorists. During the Persian Gulf War (1991) and the wars in Afghanistan (2001 to the present) and Iraq (2003–2011), however, foreign or foreign-influenced religious extremists became the FBI’s focus.

Iraq and Afghanistan

President George H. W. Bush’s commitment of troops to operations Desert Shield and, later, Desert Storm raised concerns that the situation would bring Islamist terrorism to American shores. Using the same tactics they used before Pearl Harbor, FBI agents interviewed people either suspected of terrorist aspirations or in a position to know who might harbor those ideas, in this case, Muslim Arabs. If media portrayals were correct, agents did not differentiate between these types either by their sometimes hostile questioning or by their place of interview, often at the subject’s work. As a result, Arab communities feared that they would end up in internment camps. The FBI’s reputation for breaching civil liberties fed these fears. By the war’s quick end, neither terrorism nor such a roundup took place.

Islamic terrorism arrived in the United States in 1993. A car bomb killed six in New York City’s World Trade Center, but the towers stood. Five years later, Osama bin Laden’s al Qaeda blew up the American embassies in Kenya and Tanzania. The conspirators behind the bombings were identified and convicted, and bin Laden was put on the FBI’s “Most Wanted Fugitives” list. The FBI also investigated two later incidents with less success: (1) the destruction of Khobar Towers, which housed American military in Saudi Arabia (1996), and (2) a suicide mission that killed U.S. naval personnel on the destroyer USS *Cole* (2000). President Bill Clinton had bin Laden’s suspected training camp bombed. But according to the author Richard Gid Powers, the FBI continued its emphasis on criminal investigations and judicial punishments rather than proactive operations that might compromise civil liberties or just evoke a bad press. Then on September 11, 2001, al Qaeda operatives flew planes into the World Trade Center and the Pentagon killing more than 3,000 people. Later investigations faulted both the FBI and the Central Intelligence Agency for failing to “connect the dots” and possibly prevent

this tragedy. For example, FBI Headquarters failed to follow up a field agent's suspicion of a flight student who was not interested in learning how to land. The Central Intelligence Agency, in another example, failed to inform the FBI that people it tagged as terrorists had entered the United States.

President George W. Bush almost immediately declared the United States involved in the Global War on Terrorism. For the FBI, the USA PATRIOT Act (more commonly called the Patriot Act) and new Attorney General's Guidelines updated domestic surveillance rules. For example, they took into account cell phones by permitting roving warrants tied to a person rather than a particular phone. The Patriot Act also blurred the line between security and criminal investigations by permitting the bureau to investigate suspects before they actually committed a criminal act. These changes enabled the bureau to become more proactive and share its intelligence with other agencies. In 2004, the FBI became one of the agencies that reported to the new Office of the Director of Intelligence. The FBI's National Security Division, created a year later, according to www.fbi.gov, combined "the missions, capabilities, and resources of the counterterrorism, counterintelligence, and intelligence elements of the FBI" to strengthen "the integration of the FBI's intelligence and investigative missions. Information collected through FBI investigations is analyzed, not just to build a case for prosecution, but for its predictive value."

The attorney general and the FBI director had been on the job for a short time before 9/11. They did not use the FBI's experienced counterintelligence personnel or those agents most familiar with Arab American communities as well as they might have. Initially, the FBI made high-profile arrests, but the DOJ prosecuted only a few of them on terror charges. The DOJ also instituted a program of voluntary interviews with FBI agents of Middle-Eastern Arabs legally in this country that potentially alienated those who might have been most helpful. Nevertheless, some field agents reaching out to their Arab communities developed their trust. Community members in Lackawanna, New York, told the FBI about neighbors who had trained with al Qaeda. These suspected potential terrorists pleaded guilty. In a recent 8-year period covered by New York University's Center on Law and Security, the DOJ often succeeded with terrorism prosecutions, although only 11% involved al Qaeda. Yet, as

this is written, failed bombing attempts on a flight to Detroit and in Times Square caused Congress and the media once again to question the FBI's ability to prevent terrorism in this latest war.

While the military remains in Afghanistan, the FBI plays its part in the war against terrorism. It lends its expertise wherever terrorism takes place, like Mumbai, India (2008). So many of its personnel now work overseas that the bureau gives a predeployment training class. Domestically, the FBI continues to tread the fine line between surveillance for national security purposes and protecting civil liberties. Since the FBI began in 1908, wars have challenged this dual role. That challenge has never been as great as it is in the 21st century.

FINANCE, PERSONAL

Successfully managing personal finances is an essential skill for every service member. Personal financial readiness is considered an important part of the mobilization process for deploying troops, and the administrative mobilization process specifically ensures that dependents register for direct deposit and that all of their legal documents are updated. Both the deploying members and their spouses are generally required to attend lectures that explain the military pay process and “personal financial readiness.” Financial planning services and low-cost or free legal representation for service members engaged in disputes with financial institutions or merchants are available on most bases, and military spouses are encouraged to take advantage of them. This entry examines the pitfalls of managing finances for service members and provides an overview of federal laws in place to protect service members’ personal finances.

There are a variety of resources available on base, like the Navy-Marine Corps Relief, that specialize in getting families through temporary financial crises and providing interest-free loans and other services for military families in financial distress. Other resources provided by the military include the Marine Corps’ courses in personal financial management and the programs of the Army Community Service. There are other grassroots community organizations that provide services and protections, including the Consumer Financial Protection Bureau and volunteers who provide financial advice, coupons, and other assistance at the commissary.

Unfortunately, even with all these safeguards at hand, managing personal finances is fraught with difficulty. First, military pay is based on a variety of factors, and for those without financial savvy, it can be hard to manage. While members can count on getting two paychecks every month, pay dates fluctuate from month to month depending on holidays and weekends. Additionally, pay is calculated in two categories: base pay and allowances. Base pay is based on rank and longevity, while allowances consist of housing, subsistence special pays, like combat or hazardous duty, as well as location and other factors. As a service member relocates and changes duty, his or her pay is also subject to change. Entry-level positions tend to pay well.

It can be the first time many service members have been responsible for their own finances; that responsibility can also fall in the hands of their non-military partner. Many enlisted servicemen and servicewomen are young (under 21) and have little, if any, experience in managing money. In many cases, this may be the best paying job they have held, or it may be the first time they have been responsible for managing their finances. After a deployment without the ability to spend money, many find themselves with fistfuls of cash, more than they have ever had.

For others, managing their income poses numerous pitfalls as well as additional stress for their families—especially for individuals called up from the Reserves. For a reservist, military pay often represents a pay cut. When deployed, reservists can find themselves maintaining multiple households, and they may not have an active role in the disbursement of their funds to pay bills. Virtually all military personnel have to deal with military bases surrounded by used car dealerships, furniture rental operations, paycheck loan operations and other financial services, pawn shops, jewelry stores, and so on. Enticed by new technologies and consumer goods and services with promises of easy financing, many fall prey to unsavory sales practices. Individuals managing more money than before are often tempted to spend it and can fall prey to a host of predatory proprietors and lenders. If they are unskilled at financial management, managing income can be extremely difficult and many fall victim to “payday loan” operations and others looking to assist them. These predatory lenders also tempt the reservist trying to keep up with expenses that current salaries cannot support. In addition, deployment literally makes it physically impossible for reservists to both receive and pay their bills on time, even if funds are not an issue.

Federal laws do exist to protect the military from financial usury and unsavory financial practices. For example, American soldiers and sailors and their families are protected by law from foreclosures on their homes while on active duty. One of the most important laws protecting soldiers is the Servicemembers Civil Relief Act (formerly the Soldiers and Sailors Civil Relief Act). Under the Servicemembers Civil Relief Act, active service members can receive a 6% cap on all debt, except student loans, while they are in active duty. The 6% cap includes any service charges or fees. Furthermore,

rates in excess of 6% are forgiven, and a creditor cannot by law accelerate the payment of the principal. Other provisions include protection for their dependents from eviction if they have difficulty paying their rent. Additionally, civil litigation can be postponed until a soldier returns from active service so that he or she can properly represent himself or herself in court proceedings.

Despite these legal protections, unsavory institutions, including many large national companies, have violated the rights of military personnel. JPMorgan Chase & Co. illegally foreclosed on American soldiers and was called to testify before the Veterans' Affairs Committee. Many of the same lending agencies have been forced to refund usurious overcharges and cease their foreclosure and repossession actions. The Justice Department settled suits against a subsidiary of Bank of America (Countrywide Home Loans Services) and a subsidiary of Morgan Stanley (Saxon Mortgage Services) after these companies knowingly and repeatedly violated the Servicemembers Civil Relief Act by illegally foreclosing service members' mortgages.

American service members receive many financial incentives and benefits for their service, including access to education and a pension. Additionally, the U.S. Congress votes for regular pay raises. Service members who can navigate their fluctuating pay, avoid the pitfalls awaiting their paychecks at the edges of their base, and avail themselves of the services and protections of the U.S. government can find themselves enjoying the rewards of a solid middle-class income, access to the G.I. Bill and its many financial rewards, a good pension, and a stable income.

FOOD

In his 1970 memoir, *Khrushchev Remembers*, the former premier of the Soviet Union declared that “without Spam, we wouldn’t have been able to feed our army.” The feeding of armed forces has greatly improved since the days of World War II lend-lease aid. The practice of providing food to military forces has changed over history with the evolution of the knowledge and technology of each age. U.S. military services operate today in an increasingly collaborative joint environment and yet still retain unique cultural differences in meeting their obligation of providing nutritional food in garrison and field environments. To have the right personnel with the proper equipment preparing the best rations available, each service has embraced modern technology and business practices to ensure the most effective and efficient food support for all military personnel, especially those serving in austere locations. This entry discusses the history of food service systems for feeding troops, types of rations, and

differences and similarities in food service among the U.S. armed services.

History

Humans are recognized throughout history as the ultimate primary war machine. The soldier, sailor, airman, or marine must be fueled (fed) as certainly as a tank, ship, or aircraft. Napoleon Bonaparte's maxim that an army marches on its stomach remains valid to this day. He recognized that good food was essential to maintaining his army's morale, health, and fighting efficiency. With few exceptions, early armies carried very little provisions and foraged off the land as they moved, thus limiting campaigns to near harvest time or at a fixed distance from a magazine. Soldiers at the small unit level appointed one of their own as a cook, and the quality of meals was dictated by that individual's culinary skill. Sailors aboard ship followed a similar system and fared no better. Both the U.S. Navy and Army finally recognized that specialized food service personnel were important to the proper preparation of food and formalized the cook as a military specialty. The navy, in particular, recognized the criticality of cooks and rewarded them accordingly on the pay scales of the early 1900s.

The health of soldiers, sailors, and marines suffered from the poor food preservation techniques of the time, namely, salting and smoking, and from the inevitable infestation of insects. The recognized need for fresh food and nutritious meals frequently clashed with government frugality over the price of the soldier's and sailor's daily ration. Civilian contractors often took advantage of the pricing situation and provided substandard supplies that were barely edible.

Throughout the 19th and 20th centuries, medical and scientific knowledge increased concerning the value of nutrition. This coincided with the early use of rudimentary canning in glass bottles and sealing of food in tin-coated containers that served as somewhat effective methods to package and preserve rations. Dehydration of food (the "desecrated vegetables" of the American Civil War soldier) and refrigeration techniques were also developed, although extended deployments and tropical climates still revealed weaknesses in preservation technology.

The basic ration of the Revolutionary War soldier consisted of meat (1 pound beef, or $\frac{3}{4}$ pound pork, or 1 pound fish), bread (1 pound or the same of

flour), drink (1 pint milk and 1 quart cider or spruce beer), 3 pints of peas or beans, and 1.4 ounces of rice per man. It eventually evolved to the modern family of rations seen today. Designated as A rations (fresh, refrigerated, or frozen foods), B rations (group-sized canned or preserved food prepared by food service personnel), and C rations (prepackaged preserved meals for individual use), these three groups make up the military's version of the food pyramid. The A and B rations are designed to feed groups and for preparation in a garrison dining facility, aboard ship, or in a field kitchen. They do not differ substantially from food found in a commercial grocery store, though some are designed to have longer shelf lives and are prepared by heating in a hot water immersion system. It is the final group of rations that evokes the strongest love-hate emotions from service members. The C rations represent a whole family of lightweight individual meals designed to be carried by soldiers during extended combat operations. An evolution of names from C-rats to K-rats to the MREs (Meals, Ready-to-Eat) of today are mirrored in the change of packaging from tin cans to durable plastic with the purpose of lightening a service member's load. Varieties today include humanitarian MREs (including kosher and halal meals), cold weather meals, long-range patrol meals (lighter packaging to carry more food), and First Strike rations that can be eaten on the go. Extensive research goes into the delicate balancing act of developing these rations to ensure their portability, consumability, and longevity. The military continually searches for new combinations of menus and packaging to meet the food intake needs of military personnel.

Differences and Similarities Among the Military Services

Throughout the history of each military service, separate, but duplicate, food service systems were developed to support military personnel. A focus on consolidating similar functions into joint systems began in the 1980s; however, each service still retains unique functions due to the different missions.

As the largest ground force, the U.S. Army is designated as the executive agent for food in the Department of Defense. In a mature theater, this means that the army is responsible for coordinating the delivery or contracting of food for all the services.

Under the modular, brigade-centric organizations developed by the army in the early 21st century, food service personnel and equipment were assigned down to the battalion level. This gave tactical commanders greater control in providing food support during rapidly changing (combat) situations.

Many of the systems used by the U.S. Marines are similar to those of the army, but the marines' distinct mission of conducting amphibious operations means that they have some special considerations. Because of their amphibious heritage and traditional method of deployment into combat "over the shore," marine expeditionary forces carry up to 60 days of rations on board U.S. Navy supply ships. If the duration of the operation exceeds that time period, the marines tap into the largest service user in the theater, which has usually been the army in modern times.

Unlike the other services, the U.S. Air Force operates mainly from fixed-site air bases even when deployed. Unique among services, the air force treats its food service personnel as part of a hospitality industry. The art of cooking is just one of the several activities in which airmen in the services career field are expected to maintain proficiency.

While most consumers are familiar with the headaches and costs associated with weekly grocery shopping, all would blanch at the cost of a navy carrier's food bill. A carrier under way needs a ship-to-ship replenishment every 7 to 10 days at a cost of nearly \$2 million. A simple fried chicken meal aboard a carrier requires 3,000 pounds of chicken. Though much in the feeding of service personnel is becoming a joint effort, the navy is the original source of another military-wide tradition. The Armed Forces Recipe Service, consisting of more than 1,500 of the best recipes in the armed forces, evolved from the Navy Recipe System dating back to the first navy cookbook published in 1902.

In joint service terminology, rations are a common item of support. Regardless of whether army, navy, air force, or marines, each service sets a standard of providing three quality meals per day. All services provide food to their personnel either in a garrison or in a deployed setting, with the deployment being afloat, in a field exercise, or in combat. The guiding elements, or principles, of the feeding systems for each service focus on planning, personnel, equipment, and food.

Planning for food service support must occur in parallel to mission planning and must be tailored to

support the tactical commander's intent throughout the operation. A key planning factor might be that field rations, such as prepackaged MREs, will not be used as the sole ration for a duration greater than 21 days except in extreme conditions. Subsistence units and initial stocks of rations must deploy to a theater at the beginning of operations to establish resupply points and distribution activities to meet unit requirements. During deployments (to include combat), rations will be pushed to using units on a 2-day cycle using unit-end strength to determine quantity. As operations settle down or local sources are more defined, contracting for fresh food or providing actual food service operations (support) are established (to include ice and water).

Food service personnel must be recruited and trained. In 2009, as a result of the Base Realignment and Closure (BRAC) plans, the army was designated as the executive agent for basic food service training. The Joint Culinary Center of Excellence was established at Fort Lee, Virginia, to provide garrison, field, and culinary arts training to food service personnel from all services. The U.S. Army Culinary Arts Competition is an annual event that showcases the finest talents of military food service personnel throughout the Department of Defense. Teams from installations, regions, and ships compete not only on providing the best gourmet meals but also on providing the best meals in both field conditions and using packaged operational rations.

While much of the food purchased through the Department of Defense system is similar across the services, it is the equipment and methods for storage, transport, and distribution that differentiates them.

Modern Trends: Technology and Business Practices

Providing quality food to service members everywhere has evolved from yesterday's stove-piped, resource-wasting systems to the streamlined, efficient centralized system of today. The Defense Logistics Agency (DLA) is a subordinate organization to the Department of Defense and serves as the executive agent for subsistence across all military services. Thus, DLA manages everything from setting policy to purchasing and distribution of rations worldwide.

One of the DLA's best business practices is a program called "Subsistence Prime Vendor." This

supply chain management concept involves contracting with commercial vendors for the delivery of food to military facilities in the United States and overseas. DLA saves money and increases efficiency because the vendors are responsible for inventory, warehouse management, and distribution costs rather than a government storage facility.

Since the goal of all military food operations is to provide quality, nutritious meals that people will eat, it only makes sense to provide the food with the modern choices that service members have grown up expecting. Using concepts borrowed from the fast-food industry, military services established both an à la carte cafeteria system and a quick service area providing healthy food that military personnel find appealing. The air force expanded this system to a campus dining initiative covering all sources of food for airmen on a base from the traditional dining facility to clubs, snack bars, and community centers. Other initiatives include self-serving lines and uniform menus to increase efficiency.

Another modern trend is the increased use of contractors by all military services. Private contractors have always existed to provide food for American service members. From the sutlers of the American Revolution and Civil War selling fresh foodstuff and luxuries to soldiers near the battlefield to modern fast-food restaurant chains on military bases today, the goal has always been to provide good nutritional food and maintain service member morale—at the best possible price. The current 21st-century conflicts, however, set a new precedent for the size of contractor support. In World War II, there were an estimated 12 military personnel for every single contractor. By Vietnam, that ratio had shrunk to 5 to 1. At the height of Operation Iraqi Freedom, more than 190,000 contractors existed in theater, a troop-to-contractor ratio of 1:1. Under the provisions of the army's Logistics Civil Augmentation Program, over half of these contractors carried out base operations, including food support and housekeeping services. Operating under the assumption that the American service member deserved all the trappings of home even in a war zone, military personnel found themselves able to drink fresh milk with each meal and choose from multiple flavors of ice cream for dessert. While some military food service personnel were required to monitor operations, providing control and quality assurance, most cooks found

themselves pulling other onerous duties, such as security details, far removed from maintaining proficiency in the kitchen. Contractors provide critical support to military operations, and the decision to contract out a task is the correct one many times. However, these decisions are not without risk. Short-term cost savings must be weighed against the loss of food service capability.

Some long-term cost-saving technologies have worked to improve food service capabilities. The Joint Services Combat Feeding Technology Program, under the auspices of the army, works to research new ration types, reduce packaging material, and develop new equipment. Recent research has focused on such projects as increasing the productivity of galley equipment on navy ships while also reducing size. Analysis of radio frequency identification technology is ongoing to facilitate shelf-life management of rations stored at DLA depots. The joint nature of this program itself produces efficiencies, which means more money is available for providing quality food to military personnel.

Perhaps the most challenging task is providing quality food to service personnel stationed in the most austere environments ranging from submarines deep in the ocean, signal or intelligence personnel on mountaintop sites, and soldiers at combat outposts in remote valleys. Though the degree of difficulty is increased, the method for feeding servicemen and women at these locations is not that different from that previously discussed. All the required supplies for a mission may be carried and prepared on board as in the case of a submarine. Cooks assigned to remote units have food shipped in via military helicopter, ground convoy, or air-dropped using Global Positioning System-guided parachutes that can hit a football field-sized drop zone. Standards for remote site feeding are established in contracts that provide food service support with the method of supplying meals determined by the contractor.

Conclusion

Regardless of service, providing quality food and conducting food service operations require a detailed coordination between food suppliers at the Department of Defense, commodity managers, logistics staff personnel at all levels, and food service personnel. Flexibility is always the watchword

for food service personnel. They must continually provide quality meals to all military personnel under even the most adverse conditions and be prepared to react to the changing needs of the force as new situations arise.

FORCE RECONNAISSANCE, MARINE

Marine force reconnaissance refers to specialized units of the U.S. Marine Corps that are equipped, trained for, and doctrinally tasked with conducting amphibious deep reconnaissance missions for a Marine Expeditionary Force. For several decades, force reconnaissance units also trained for and carried out other types of special operations missions. More recently, with the creation of the Marine Corps Special Operations Command, force reconnaissance units have returned to their traditional emphasis on reconnaissance. This entry discusses the history and organization of Marine Corps force reconnaissance and the types of missions.

Missions

Marine Corps doctrine distinguishes among three basic types of reconnaissance missions: (1) close reconnaissance, (2) distant reconnaissance, and (3) deep reconnaissance. The primary mission

of force reconnaissance units has always been to conduct *deep amphibious reconnaissance* operations in support of the largest Marine Corps units: marine divisions, Marine Expeditionary Forces, Marine Expeditionary Units, and other major task forces. Close reconnaissance is conducted by forward-deployed conventional units focusing on the nearest portions of the area of operations and enemy forces that are already committed to the battle, while distant reconnaissance focuses on the farthest reaches of the area of operations, enemy supporting arms and enemy reserve forces, and is conducted by a marine division's specialized reconnaissance battalion.

Deep reconnaissance, the doctrinal responsibility of force reconnaissance units, can encompass any objective within the force commander's area of interest and focuses on enemy reinforcements rather than the enemy's committed forces or supporting arms. Deep reconnaissance missions place a marked emphasis on stealth and normally require extensive maneuver ashore. They are conducted outside the range of supporting arms and reinforcement by friendly forces and often require specialized insertion and extraction techniques.

Like other elite units, force reconnaissance units have been assigned missions that are not always in accordance with their doctrinal missions. In Vietnam, force reconnaissance units often conducted long-range reconnaissance patrols and frequently acted as forward observers for air and artillery strikes. More recently, in the Iraq and Afghanistan conflicts, force reconnaissance units have been tasked with motorized raids and foot patrols to capture high-ranking insurgent targets, as well as other types of conventional operations.

Selection and Training

Marines assigned to force reconnaissance units undergo an arduous selection and training process. Military occupational specialty training for all battalion and force reconnaissance Marines takes place at a basic reconnaissance course, which develops the candidates' skills in communications, supporting arms, amphibious reconnaissance, land navigation, and ground reconnaissance. This course also develops candidates' physical abilities, including long-distance swimming, to a high level. Force reconnaissance marines then go on to a series of

specialized schools, including schools for combatant diving, parachute training, and training in survival, evasion, resistance, and escape. They also train in a variety of insertion and extraction techniques, including free-fall parachuting, submarine insertion, and specialized helicopter extraction.

Organization and Units

Throughout much of their history, force reconnaissance marines have been organized into companies of approximately 100 marines. These force reconnaissance companies sometimes formed part of the divisions' reconnaissance battalions for administrative purposes, although the companies themselves supported the Fleet Marine Forces rather than the

division. Each company had a headquarters platoon, a support platoon, and a number of operational platoons (typically six). Each platoon was itself made up of three teams of four to seven men apiece. Each team generally operated independently of the other teams.

With the activation of the Marine Corps Special Operations Command, the organization of force reconnaissance units has changed considerably. Personnel from the former force reconnaissance companies of the First and Second Marine Divisions now form the core of the new Marine Corps Special Operations Command battalions. Each of the division reconnaissance battalions retains a force-level reconnaissance capability, which is now organized into a company of three operational platoons plus a

U.S. Marines board the guided missile destroyer USS *Barry* (DDG 52) from a rigid hull inflatable boat during an enhanced visit, board, search, and seizure training mission in the Mediterranean Sea, May 14, 2011. Raufmann (released).

headquarters platoon. The two traditionally organized force reconnaissance companies that remain active—the Third and Fourth Force Reconnaissance companies—are both reserve units.

History

The roots of Marine Corps force reconnaissance lie in the work of Major Dion Williams, who published the first formal statement of amphibious reconnaissance doctrine in 1906. His ideas saw practical application in 1920, when Lieutenant Colonel Earl Ellis was posted to the Pacific to collect information for use in possible future operations. (His work ultimately became the basis for the American campaign against Japan in World War II.) As the Marine Corps developed doctrines for amphibious landings, the need for long-range reconnaissance became clear, and the first amphibious reconnaissance units were formed in 1938. These units carried out missions in support of a variety of operations, notably the major landings at Tarawa, Tinian, Iwo Jima, and Okinawa, as well as the Solomon Islands and Bougainville.

These units were disbanded at the end of World War II but dedicated reconnaissance units were re-formed in 1950, seeing action in the Korean War and in Vietnam, where they worked with the Studies and Observations Group and carried out a variety of missions for the marine divisions. After Vietnam, force reconnaissance marines participated in various operations, including Lebanon (1983), Grenada (1983), Desert Storm/Desert Shield (1991), Operation Enduring Freedom (2002), and Operation Iraqi Freedom (2003).

In 2005, the secretary of defense authorized the formation of a Marine Corps component for the Special Operations Command. The new component, called Marine Corps Forces Special Operations Command, drew the bulk of its personnel from the existing reconnaissance community, including the force reconnaissance companies. However, each marine division continues to retain a somewhat smaller force reconnaissance company within its division's reconnaissance battalion.

FOREIGN RELATIONS COMMITTEE, HOUSE

The House Committee on Foreign Affairs, more commonly called the House Foreign Relations Committee, is among the weaker actors in the defense and foreign policy-making processes. Previously known as the House International Relations Committee, it was founded by a congressional resolution in 1822 and has played a role in pivotal moments in U.S. diplomatic history. Its primary roles are to provide oversight to the executive agencies that conduct diplomacy and to draft and pass legislation related to foreign policy. The chair and ranking member have considerable clout, however, and are consulted by the president and often participate in delegations to foreign countries. The House Foreign Relations Committee subsumes seven subcommittees organized by region or theme (e.g., trade, human rights, global environment) that manage the minutiae of the committee's responsibilities. One distinction that the House Foreign Relations Committee holds over other congressional actors is its unique ability to originate spending bills related to foreign policy. This entry discusses the powers and responsibilities of the House Foreign Relations Committee.

There are significant differences between the House Foreign Relations Committee and its complement in the Senate. First, all House members serve identical 2-year terms and are continually

campaigning for reelection. Unlike senators and their staggered 6-year terms, House members are thus more sensitive to current trends in public opinion and are more likely to represent the grass roots. The second substantial difference between the House and the Senate is the former's lesser constitutional authority to influence foreign policy. While the Senate Foreign Relations Committee has the power and responsibility to ratify treaties and confirm presidential appointees, the House Committee does not. One exception to the general trend of Senate superiority is the House Committee's prominent role in originating foreign policy–spending legislation, including foreign aid. A third difference between the House and Senate Committees rests on the fact that the House Committee has more members with niche expertise. Since House Committee members do not have to serve on as many committees as their Senate counterparts, they often develop a deep technical knowledge of foreign affairs relevant to their subcommittees.

The committee has two substantial powers and responsibilities. First, it oversees all of the executive agencies that conduct foreign policy. These include the Department of State, the Peace Corps, and the U.S. Agency for International Development. The committee's oversight takes one of two paths, depending on the context and the leadership of the chair and ranking member. The first style of oversight is the holding of regular meetings and soliciting testimony from key executive branch foreign policymakers, for example, the secretary of state. With these regular meetings, executives of key agencies report under oath on foreign policy–making activities. The second style of oversight is the creation of special investigations. The committee has the power to subpoena records, experts, and executive branch policymakers to either report on their activities or provide research and insight regarding matters of national security and foreign affairs. In recent years, the committee has routinely investigated the issue of nuclear weapons proliferation, the conduct of the wars in Iraq and Afghanistan, and the status of human development in the Southern Hemisphere. Both of these types of hearings can be public or closed, depending on the sensitivity of the matters discussed.

Second, the committee considers foreign policy legislation and approves it for consideration by the entire House. Historically, this legislation has varied in scope and authority. One of the most significant

actions taken by the committee was the approval of the Marshall Plan in 1947, which marked a monumental shift in American foreign policy toward engagement in Europe and is one of the most significant financial commitments the United States has ever made to foreign countries. The committee also took the first step in defunding the Vietnam War in 1973 and was the source of H.J. Res. 114, which in 2002 authorized President George W. Bush to use military force against Iraq. Other forms of legislation include nonbinding resolutions that make statements on world events, remarks on world events, and condemnation of violence against American allies, among others.

The rules of the committee provide for a chair from the majority party and a ranking member from the minority party. These leaders are highly visible, often make media statements on foreign policy, and are occasionally included in delegations to and negotiations with foreign countries. The committee has the ability to take actions that complicate presidential action and potentially contradict official U.S. policy. One notable example is the committee's approval of a resolution that acknowledges the 1915 Armenian Genocide in Turkey. The House Foreign Relations Committees of the 110th and 111th Congresses passed this resolution, potentially jeopardizing U.S.-Turkey relations and Turkish cooperation necessary to prosecute the wars in Afghanistan and Iraq. The House of Representatives has not considered these resolutions, but their mere passage in the committee provoked terse reactions from the Turkish government.

The role of the committee in the conduct of foreign policy today is best understood in its dual roles of oversight and legislation. Many of the pressing foreign policy issues (e.g., climate change, nuclear proliferation, terrorism, the War in Afghanistan) are topics of constant investigation by the committee. Such public hearings have the effect of shifting the agenda of the Congress, raising public awareness, and serving as a potential signal to other countries of American intentions. In recent years, the committee has reviewed foreign policy and the president's actions regarding the wars in Iraq and Afghanistan, the Copenhagen Conference on Climate Change, U.S.-Mexican cooperation on the transshipment of illegal narcotics, arms reduction talks, trade with the People's Republic of China, and the promotion of human rights in developing and newly developed countries.

The House Foreign Relations Committee is positioned to play a role in foreign policy making in the early 21st century, although it faces considerable limits to what it is able to accomplish. In an era of increased globalization and fast communication, the federal government requires expedient and effective foreign policy decision making that a committee of divergent interests and constituencies might struggle to provide. When coupled with the president's advantage in having access to privileged information, these trends curtail the committee's ability to be intimately involved in the daily management of American foreign policy. It is likely that the committee will continue its role as a periodic reviewer of the executive branch's actions, and it will retain the ability to fund and defund foreign policy initiatives. In other regards, however, the committee is an important but secondary player in the American foreign policy-making apparatus.

FOREIGN RELATIONS COMMITTEE, SENATE

The Senate Committee on Foreign Relations was established by an act of Congress in 1816 as one of its 10 original committees. It commands a special role in the creation of foreign policy as the first reviewer of policy-sensitive matters. The committee is composed of a variable number of senators, who are apportioned by party and led by a chair from the majority party and a ranking member from the minority party. The Senate Foreign Relations Committee is the first institution to consider the confirmation of presidential appointees critical to the conduct of foreign policy, including the secretary of state and U.S. ambassadors. Equally important, the committee is the first to consider foreign treaties for ratification. Senators and executive branch policymakers often

consult committee members, and their membership on subcommittees gives them a niche expertise on regions and critical foreign policy issues. The committee as a whole oversees all of the executive branch agencies and programs that relate to foreign policy. Furthermore, the chair and ranking members of the Senate Foreign Relations Committee are prominent in negotiations with foreign missions, consult the president on politically sensitive matters, and are routinely included on foreign delegations. This entry discusses the powers and responsibilities of the Senate Foreign Relations Committee.

The first major power and responsibility of the Senate Foreign Relations Committee is treaty ratification. According to Article I of the U.S. Constitution, the Senate retains the sole power to ratify treaties with foreign countries. After the adoption of the committee system in 1816, the Senate Foreign Relations Committee has had the responsibility to conduct the first review of treaties before they are forwarded to the entire Senate for ratification.

The process of considering a treaty for ratification is a labor- and time-intensive process for the committee. Members of the committee, many of whom have developed areas of foreign policy expertise over years of service, often consider the technical details of the treaties before voting. This is not to say that party or individual interests do not influence treaty consideration or other functions of the committee. Members do tend, however, to approach the matter of ratification from a more practical aspect than senators who do not sit on the committee. Notable treaties considered by the committee include the Alaska Purchase (1867), the Treaty of Versailles (1919), the United Nations Charter (1945), the Nuclear Non-Proliferation Treaty (1968), the Convention on the Law of the Sea (1994), and the Kyoto Protocol (1998).

The second aspect of the committee's role in making foreign policy is its initial review of all diplomatic and foreign policy personnel. Executives of agencies that conduct foreign policy as well as U.S. ambassadors must undergo a confirmation process that commences with the committee. The committee vets each candidate carefully and in a manner that is occasionally linked to political agendas. While many diplomatic posts are filled by career diplomats and are not heavily politicized or scrutinized, other candidates can be political appointees and have little or no diplomatic experience. In such instances, the

committee tries to ensure that nominees are worthy of full consideration. Perhaps more impactful on the making and conduct of foreign policy is the vetting of the president's nominees for secretary of state and ambassador to the United Nations. Once approved by a simple vote in the committee, presidential nominees are now considered by the entire Senate.

The Senate Foreign Relations Committee also oversees the agencies that conduct foreign policy, which is the third set of powers and responsibilities it has regarding foreign relations. On a routine basis, the secretary of state reports to the committee on the status of foreign policy and international affairs. Other executive branch officials also report to the committee. The committee also occasionally investigates particular foreign policy issues in either an open or a closed forum. Oversight extends beyond diplomatic issues to include budgetary, legal, personnel, and operational issues. Some of the agencies and institutions that the committee oversees include the Department of State, the Peace Corps, and the U.S. Agency for International Development.

While oversight of foreign affairs has been a cornerstone of the Senate Foreign Relations Committee, recent trends indicate an increase in the president's use of executive prerogatives to avoid supervision. While some oversight panels are highly effective in influencing the president's foreign policy agenda, the frequency and intensity of oversight in foreign affairs has decreased over the past decade.

Prominent leaders in the foreign policy-making apparatus have served on the Senate Foreign Relations Committee. Historically, some of the most notable foreign policy leaders and foreign policy decisions have originated in the committee. Most notably, the Senate's refusal to ratify the Treaty of Versailles originated in the committee with its chair, Henry Cabot Lodge. Lodge, who descended from a family of diplomats, was well versed in foreign affairs and was highly respected among his colleagues. His criticism of the treaty gained traction among the committee and the remainder of the Senate, effectively suspending American involvement in European politics and weakening the League of Nations, which was greatly favored by President Woodrow Wilson.

Strong committee chairs have made their mark on foreign policy in the post-Cold War era as well. As chair in 1996, Senator Jesse Helms (R-NC) used his position and influence to gain congressional

approval of the Helms-Burton Act, which tightened sanctions on Cuba against the wishes of the Clinton administration, which preferred a less coercive approach. In recent years, Senator Joe Biden (D-DE) was the most vocal critic of the Bush administration's neoconservative foreign policy and laid the groundwork for a new realist grand strategy.

In recent years, committee members from both parties have taken an active role in foreign policy by inserting themselves in key negotiations. John Kerry (D-MA) was particularly active as chair. He held high-profile meetings with the leaders of Syria, negotiated sanctions on Iran with the Russian Federation, and mediated a dispute between the Afghan government of Hamid Karzai and the Obama administration.

Due to changes in the committee membership, the beginning of the 113th Congress brought a new chair (Robert Menendez, D-NJ) and a new ranking member (Bob Corker, R-TN). Both of these leaders came to their positions with less foreign policy experience than their predecessors. Menendez has indicated a willingness to work closely with the Obama administration, while Corker has focused his early attention on finding cost savings in the foreign policy bureaucracy and foreign aid budgets.

Among the congressional committees relevant to foreign policy, the Senate Foreign Relations Committee is the most influential. There are limits to its influence, however, in an era of presidential preponderance in foreign policy making. Still, due to provisions written in the Constitution, the committee is poised to continue its central role in the creation and maintenance of American foreign policy.

FRANCE

France is a western European country of 65,500,000 people and 212,814 square miles (640,053 square kilometers), including territories in the Caribbean

Sea (French Guiana, Guadelupe, and Martinique), the Pacific Ocean (New Caledonia, French Polynesia), and the southern Indian Ocean (Reunion and Mayotte). Paris is the country's capital, principal city, and economic and cultural center. France is the world's fifth largest economy with a 2009 nominal gross domestic product (GDP) of \$2,635,000,000. Its defense budget takes up 2.3% of the GDP, which makes it the third largest in the world and represents 4.2% of global military spending. France is one of the strongest military powers in the world, though it lags far behind the United States, which spends 43% of all global spending. French forces are deployed throughout the world, including 20,800 French troops outside French territory in the Central African Republic (200), Chad (1,000), Côte d'Ivoire (4,000), Djibouti (2,900), Gabon (800), Senegal (1,100), Democratic Republic of the Congo (20), Bosnia (510), Kosovo (2,400), Afghanistan (1,870), Lebanon (2,000), and Mali (4,000). Over the past 15 years, the French military has undergone a major reorganization to adapt itself to the post-Cold War world just as the government and economy have also experienced major structural changes. This entry explores the evolution of French military, diplomatic, and economic policies over the past 20 years in response to domestic and international pressures.

French Government

Founded in 1958 by Charles de Gaulle following a military revolt during the Algerian War (1954–1962), the French Fifth Republic combines a strong presidential system with a parliamentary democracy. The president is elected to a 5-year term by universal suffrage using a 2-round system in which the two candidates with the most votes in the first round advance to the second round, unless one has an absolute majority. The bicameral parliament consists of a lower house, the National Assembly, which is elected to a maximum 5-year term, and a Senate, which is elected indirectly. The president appoints a prime minister whose cabinet requires majority support in the National Assembly. Presidents have sometimes shared power with a hostile prime minister and cabinet in a situation known as cohabitation, but that likelihood was reduced after a referendum in 2000 cut the president's term from 7 to 5 years. In May 2012, the Socialist François Hollande was elected president of the French Republic after defeating

incumbent President Nicolas Sarkozy of the conservative *Union pour un mouvement populaire* in a close election. Sarkozy's popularity had waned as a result of his support for austerity measures designed to strengthen the euro and the widespread perception that his high media profile had reduced public respect for his office. Hollande's *Parti socialiste* won the subsequent legislative elections, but it required support from its allies the *Parti radical de gauche* and the Greens to command a majority in the National Assembly. Hollande appointed Jean-Marc Ayrault as his prime minister, and Ayrault, in turn, formed a coalition government dominated by the *Parti socialiste*.

French Economy

The French economy is approximately 18.7% the size of American economy, making it the world's fifth largest economy and the second largest, after Germany, in the European Union (EU). Subsidies from the EU's Common Agricultural Policy have allowed France to retain a larger small-plot farming sector than is typical in advanced countries. Since the mid-1980s, the government has privatized many companies, and the economy is increasingly market oriented. The French unemployment rate has remained stubbornly high, ranging from 10% in 2000 to a low of 7.4% in 2008 before rising back to 10% during 2010. Seventy-five percent of France's electricity comes from nuclear power, and despite opposition from environmentalists, the first examples of a new generation of nuclear power plants are under construction. France's largest trading partners are other EU nations, but the United States accounts for 4.3% of French imports and 5.8% of exports, making it France's sixth largest trading partner.

France and the Euro Crisis

The euro crisis grew out of the rise in eurozone (countries that have adopted the euro as their currency) government debt following the 2008 global financial crisis and the 2009 Dubai sovereign debt crisis. In January 2010, it accelerated when an EU report revealed that the Greek budget deficit was much larger than the Greek government had admitted. By April, estimates of the Greek budget deficit grew from 3.7% to 13.9% of GDP. It soon became clear that Greece would struggle to pay its debts, which exceeded 140% of GDP. The Greek crisis

triggered market speculation about which other euro members would be next. Initial speculation centered on Ireland, Portugal, and Spain, but it soon included Italy as well. The French deficit was 7.7% of GDP, and it was able to easily service its public sector debt, but by the middle of 2011, capital markets feared that French banks were too exposed to Greek and Italian debt. Money market managers worried that if weaker governments defaulted, either the French banking system would collapse or the French government would have to assume so much debt to support the banking system that it could not safely service the debt. That combined with increasing market concern about the ability of the euro to survive a default by a major member state drove up bond yields, pulled the French into the crisis, and caused France to lose its AAA credit rating in January 2012. Fears over the stability of French banks were one of the major factors that pushed President Sarkozy and the German chancellor Angela Merkel to agree to create the European Stabilization Mechanism and allow the European Central Bank to act as a lender of last resort for French banks, helping them retain access to credit, despite fears over the amount of potentially bad debt they held.

President Sarkozy's policies tried to calm the markets without forcing any eurozone members to abandon the euro while entrenching French influence within strengthened EU institutions. Sarkozy argued that the best way to end the crisis was by enhancing fiscal integration within the EU either through stronger EU powers over national budgets or through the creation of bonds that would pool national debts. However, Sarkozy faced opposition from Germany and Britain. Germany's Angela Merkel opposed European bonds because she feared that Germany would be forced to pay the debts of less financially stable euro members, and Britain's David Cameron opposed giving the EU the power to supervise national budgets or to tax financial transactions. The conflict ultimately led Cameron to veto the proposed EU treaty in December 2011, and Sarkozy and Merkel had to arrange a separate treaty. Sarkozy based his gambit on the assumption that France would remain powerful enough within the EU to insulate itself from outside control of its budgetary decision making and that the new supervisory powers would calm the markets.

As the summer of 2012 began, the eurozone crisis remained acute. The crisis led to the collapse of the

Greek coalition and new elections in Greece, which called the terms of the bailout into question. Spain's economy was also under attack, and the new conservative *Partido Popular* government, which was elected in the fall of 2011, faced discontent over the scale of the budget cuts necessary to conform to the EU's austerity program. Even President Sarkozy's election defeat was influenced by the negative effects of the eurozone crisis on the French economy and his inability to increase spending or cut taxes before the election because of market and EU pressure to maintain austerity measures. President Hollande's accession to power raises the possibility of a shift in French policy because he campaigned on a promise to increase government spending to boost consumer demand in France. Such a policy would expand France's budget deficit and risk breaking the EU consensus that fiscal austerity is the only way to maintain the euro's damaged credibility.

French Society

The French state actively encourages gender equality and officially does not recognize racial or ethnic distinctions among citizens. Political parties are required to nominate equal numbers of men and women for parliamentary elections, but in practice, the major parties prefer to pay a fine to avoid complying with the law. The passage of the civil partnership law by the Socialist-led cabinet of Prime Minister Lionel Jospin in 1999 marked the growing acceptance of gay and lesbian rights in France, and marriage equality is now a significant political issue on the French left. During the 2012 presidential campaign, Hollande expressed his support for legalizing same-sex marriage.

Since the 1970s, France has attracted large number of immigrants from former French colonies in the Middle East and West Africa. Despite perceptions that France is experiencing mass migration, the current net-migration rate is barely one third that of the United States (1.48/1,000 vs. 4.31/1,000) and lower than that of Britain and Germany. Nevertheless, about 8% of the French population is foreign-born, and there are probably about 5,000,000 Muslims in France, mostly first- or second-generation immigrants. In 2002, fears about immigration and crime propelled Jean-Marie Le Pen, the leader of the extreme right-wing National Front, into the final round of the presidential

election before being decisively defeated by Jacques Chirac. Increasingly, conflicts over race and gender have displaced conflicts over class as the main fault lines in debates about the structure of French society. This is reflected in the long debate over Muslim girls wearing head scarves in public schools and President Sarkozy's call to ban women wearing the burqa in public. Before the 2012 presidential campaign, Jean-Marie Le Pen handed control of the National Front to his daughter Marine Le Pen, who finished third but won 17.90% of the vote in the first round, the party's best showing ever in a presidential election. The National Front's success in 2002 and 2012 has sparked concerns about why so many French voters are willing to support a party that contains members, including Jean-Marie Le Pen, who have denied the Holocaust and who are generally believed to be racists.

Recent French Military History

After the end of the Cold War, French defense policy was reoriented toward foreign interventions. Under United Nations and Western European Union auspices, French president François Mitterrand contributed 15,000 troops under General Michel Roquejeoffre to coalition forces during the Persian Gulf War, including the 12,500-man division Daguet, which was built around the *6e division légère blindée*. During the ground campaign, division Daguet, under General Bernard Janvier, formed part of U.S. General Norman Schwarzkopf's Left Hook strategy and operated as part of the U.S. XVII Airborne Corps (a unit designed for rapid deployment anywhere in the world). The French force included 44 AMX-30 tanks, 12 Mirage 2000s, and 24 Jaguar strike aircraft.

Although the French government attempted to stay out of the Balkan Wars, the growing humanitarian crisis in Bosnia led Mitterrand to deploy French forces as part of the UN Protection Force in February 1992. The two French generals, Bertrand de Sauville de La Presle and Bernard Janvier, commanded the UN Protection Force between March 1994 and its dissolution in January 1996, during the implementation of the Dayton Peace Accords.

In March 1999, the French president Jacques Chirac, who took office in May 1995, joined Operation Allied Force, the North Atlantic Treaty Organization campaign against Yugoslavia. The

French air force and navy Mirage 2000s and Super Etenards contributed to the North Atlantic Treaty Organization's bombing campaign. After the September 11, 2001, attacks, Chirac sent French naval, land, and air forces, including the newly operational aircraft carrier *Charles de Gaulle*, to support the U.S.-led coalition forces in the Afghanistan War, and French forces remained in Afghanistan as part of Operation Enduring Freedom throughout the decade.

Franco-American cooperation did not extend to the 2003 U.S.-led invasion of Iraq. The bitter Franco-American feud over George W. Bush's decision to invade Iraq was highlighted by the French foreign minister Dominique de Villpen's dramatic global shuttle diplomacy as he rallied global opposition to the U.S.-led invasion. Villpen's campaign highlighted French leaders' attachment to multinational institutions, though France itself sometimes acted unilaterally. This diplomatic confrontation stoked public anger in both countries and left a deep scar on Franco-American relations.

Although French opposition to the Iraq War created the impression in the United States that the French were pacifists, French forces continued to fight in Afghanistan, and President Chirac continued to intervene in conflicts throughout the world. In September 2002, French troops intervened in Côte d'Ivoire to end that country's civil war. The intervention occurred without the approval of the UN Security Council but was later sanctioned by that body. Despite the hostile relationship between Bush and Chirac, the French and American governments cooperated closely during the 2004 Haitian crisis. Franco-American pressure forced the Haitian president Jean-Bertrand Aristide to resign in February 2004 in order to stop the Haitian Civil War. Between 2007 and 2009, French forces intervened in the Central African Republic with air strikes and ground forces to stabilize the rule of Françoise Bozizé and to prevent the spread of unrest from neighboring Darfur as part of an EU mandate.

President Nicolas Sarkozy's election in May 2007 improved Franco-American relations. In 2009, France rejoined the North Atlantic Treaty Organization's integrated command structure after an absence of 42 years. Sarkozy's move signaled the French government's interest in repairing the Franco-American diplomatic and security relationship. Sarkozy's June 2008 White Book laid out France's future defense strategy. It promised to retain

a smaller nuclear deterrent and make the conventional force more efficient by cutting 54,000 military personnel by 2015 to reduce the proportion of the defense budget spent on logistics and support from 60% to 40%. In the wake of the White Book, Sarkozy approved funding to build a *de Gaulle*-class aircraft carrier but promised that it would not be nuclear powered. The future of this project, however, remains in doubt. The Sarkozy government never began construction of the vessel and changed its design several times before leaving office. François Hollande's election will certainly lead to changes in French defense policy, and his commitment to extensive domestic social spending might affect plans to build a second aircraft carrier.

Despite Hollande's stated intention to abandon France's postcolonial role as the guarantor of many of the regimes in its former colonies in Africa, the Malian Civil War led him to order French troops to intervene. In January 2013, he ordered 4,000 French troops to assist the Malian government in its struggle against the Tuareg nationalists of the *Mouvement national pour la libération de l'Azawad* and Islamist groups, including *Ansar Dine*. Between January and March 2012, the rebels had overrun most of northern Mali, and *Ansar Dine* had begun destroying parts of Timbuktu. Their advance had triggered a military coup that overthrew President Amadou Toumani Touré in March 2012. Following international sanctions and a partial return to civilian rule in Mali, the battle lines stabilized as the *Mouvement national pour la libération de l'Azawad* and *Ansar Dine* fell into a conflict, which *Ansar Dine* exploited to take control of most of Mali's northern cities.

President Hollande authorized Operation Serval in January 2013, following a new offensive by *Ansar Dine* against government positions that resulted in the fall of Konna and which threatened to open the way for the conquest of southern Mali. Utilizing its own transport aircraft together with planes from the United States and Britain, the French military airlifted 4,000 men and their equipment to Mali and opened an offensive against *Ansar Dine* within days of the decision being taken to intervene. The French force included soldiers from the *6e Brigade légère blindée*, *11e brigade parachutiste*, *9e Brigade légère blindée de marine*, and the *3e Brigade mécanisée*. These included elements of units with a long colonial-era connection to Africa, including the *1er Régiment étranger de cavalerie*.

In late January and early February 2013, French forces routed Islamist fighters with help from the Malian army, other African states, and *Mouvement national pour la libération de l'Azawad*, which defected to the government side after France intervened. By mid-February, all of Mali's major cities were back in government hands. French forces are set to remain in Mali for the foreseeable future to help the government deal with ongoing terrorist and guerrilla violence, but as of the writing of this entry, it is too early to tell whether *Ansar Dine* and other Islamist groups will be able to sustain an insurgency against French and Malian forces.

French Armed Forces

French Army (Armée de Terre)

The French army consists of 112,800 soldiers and has been an all-volunteer force since 2001. The end of conscription reduced the force by 50% but made it more deployable by eliminating the political difficulties attached to sending conscripts abroad. To compensate for the loss of its conscripts, the army has shifted many functions to civilian workers and increased its recruitment of women. During the 1990s, the French army abandoned divisional organization. The previous five-battalion light divisions were abolished and replaced by independent brigades. The brigades deploy three battalion-sized regiments as well as artillery and support forces. The new organization recognized that the French army was unlikely to face large-scale conventional fighting without help from allies. The brigades can act as self-sufficient intervention forces in the Third World and function as part of larger coalitions.

The French army's equipment is largely of domestic or European manufacture. The increasingly competitive arms export market has strained the French arms industry, but cooperative ventures with other western European countries have allowed France to retain its position as one of the top five arms-exporting countries in the world. The army's major weapons systems include the Leclerc main battle tank, the new VBCI infantry-fighting vehicles, the AMX 30 AuF1 self-propelled gun, and the new CAESAR 155-millimeter truck-mounted cannon. The striking differences between the armored AMX 30 AuF1 and the unarmored but highly mobile CAESAR reflects the French army's increasing focus on operations in the Third World.

French Navy (Marine Nationale)

The French navy consists of 77 combatant vessels, 37,000 military personnel, and 6,000 civilian workers. The 38,000-ton aircraft carrier *Charles de Gaulle* is the centerpiece of the fleet. Entering service in 2001, the *de Gaulle* served three tours supporting the War in Afghanistan in 2001–2002, 2005, and 2006. It is a modern and highly effective naval combatant and the first nuclear-power surface warship built in western Europe. The *de Gaulle* can deploy up to 40 fixed-wing aircraft using catapults, including state-of-the-art Rafale M naval fighter-bombers, Super Etendard strike aircraft, and American-designed E-2C Hawkeye air early-warning aircraft.

The four *Le Triomphant*-class SSBNs (nuclear powered submarines capable of carrying nuclear-armed ballistic missiles), which entered service between 1997 and 2010, carry the intermediate-range M45 missile, which became France's primary

means of delivering nuclear weapons after intermediate-range ballistic missile bases on the Plateau d'Albion were closed in 1999. The six active *Rubis*-class nuclear-powered attack submarines began building in the late-1970s and are showing their age, though they remain effective against most opponents they are likely to face. Although the *Cassard*-class guided missile frigates (often credited as a destroyer outside France) are obsolete by American standards, they are equipped with the SM-1 MR as well as the Mistral surface-to-air missile and are effective against most threats. The *Lafayette*- and *Horizon*-class frigates showcase the high technological standard of the French fleet and its superb antisubmarine capacity. The French also maintain a group of inexpensive and lightly armed vessels, such as the *Floréal* class, to use as patrol ships in the Third World.

The combination of the *de Gaulle*'s large complement of modern fixed-wing aircraft, the fleet's excellent antisubmarine warfare vessels, and the presence

A French Super Etendard aircraft from the nuclear-powered aircraft carrier French navy ship *Charles de Gaulle* (R 91) performs a touch-and-go landing on April 12, 2007, on the flight deck of the *Nimitz*-class aircraft carrier USS *John C. Stennis* (CVN 74). *Stennis*, as part of the John C. Stennis Carrier Strike Group, and *Charles de Gaulle*, the flagship of Commander, Task Force 473, are operating in the northern Arabian Sea.

of several modern amphibious warfare ships makes the French navy one of the most capable naval forces in the world. President Sarkozy's decision to build a second carrier similar to the *de Gaulle* secured France's status as a major naval power, and at least until the British *Queen Elizabeth*-class aircraft carriers enter service sometime after 2016, the *de Gaulle* gives France a naval power-projection capacity second only to the United States.

Air Force (Armée de l'Air)

The French air force includes 44,400 military personnel and 6,500 civilian workers and deploys more than 800 aircraft, including 368 fighter and strike aircraft. Between 2006 and 2011, the French air force reduced its inventory of active combat aircraft from 305 to 225. Although some Mirage F-1s remain in service and the air force retains a large fleet of Mirage 2000s, the future combat power of the French air force is based on its growing fleet of Rafale fighter-bombers. The Rafale has a technological advantage over all the best fighters in the world, although it is not equivalent to the American F-35 or F-22. The French also deploy the Boeing E-3 Sentry AEW aircraft and a large fleet of transport aircraft.

Civil-Military Relations

Despite a history replete with civil-military crises between 1890 and 1962, today's French military is solidly under civilian control. The president has primary responsibility for national defense, though he must share power with the prime minister and the minister of defense. When the president and the cabinet are from different parties, as happened during the 1986–1988 and 1997–2002 cohabitations, the presidents clashed with the cabinet over defense policy, making it harder to plan for the future. The cuts announced in the 2008 White Book produced some complaints by senior officers, but discontent did not lead to a major political intervention by military leaders or a civil-military crisis.

The French public has generally supported foreign military operations, in part because the government usually obtains approval from international organizations and emphasizes humanitarian justifications for intervention. However, the development of international and humanitarian law has created challenges for France because of the legacy of decolonization. During the Algerian War, French forces routinely

used torture and extrajudicial executions to combat the *Front de libération nationale*, and debates about the legacy of the war have created controversy when human rights groups have attempted to force the prosecution of retired French servicemen.

FREDERICK II OF PRUSSIA

Frederick II (1712–1786) stands alongside Alexander, Hannibal, and Napoleon as one of the most distinguished commanders in the history of warfare. This entry examines the rise to prominence of Frederick II, his writings, and his military principles.

Biography

Born in 1712 as the son of Frederick William I of Prussia and Sophia Dorothea of Hanover, his youth

was affected by an enduring conflict with his father, later called the “soldier king,” culminating in a disastrous attempt to escape to France in 1730. The plot failed and Frederick was imprisoned in Küstrin, where he watched his confidant Hans Hermann von Katte executed. After being pardoned by his father, the crown prince was trained for governing the military and the state. In 1733, Frederick married Elisabeth Christine of Brunswick-Bevern but kept an enduring distance from her as well as from most other women for the rest of his life. After his accession to the throne in 1740, the young monarch immediately started the war against Austria, conquering Silesia to achieve a Europe-wide reputation and to consolidate his “kingdom of borders.” Successfully keeping control over Silesia during the First and the Second Silesian Wars (1740–1742 and 1744–1745), he finally entered into the Third Silesian or Seven Years’ War (1756–1763). Prussia survived the war, maintaining the status quo ante bellum and establishing itself as the fifth greatest power in Europe. In 1772, Frederick extended Prussian territory through the first partition of Poland with the help of Austria and Russia, while in 1778–1779 he fought the War of the Bavarian Succession to prevent Austria from annexing Bavaria. The later years of the Prussian monarch saw continuing modernizing reforms of the economy, the bureaucracy, and agriculture, combined with a policy of religious toleration.

Military Writings and Principles

Until the mid-1730s, there was little evidence that Frederick would become an acclaimed military thinker. His military ambitions started in 1734 when he accompanied Prince Eugene of Savoy on a campaign against France. Two years later, he moved to Rheinsberg, where he celebrated the arts and started studying classical military writers like Caesar. But not until the end of the first two Silesian wars did he start reading the works of military thinkers like Turenne, Feuquière, or Folard in a systematic way. Developing his own ideals of military leadership in his *Anti-Machiavel* (1740), Frederick produced a respectable oeuvre of military literature over the following years. His military writings, nevertheless, do not contain abstract maxims and principles on the art of war that are applicable to any historical context in the way Carl von Clausewitz did later. Instead of a general system, we find numerous

regulations and instructions for infantry, cavalry, and artillery with a strong focus on every possible detail. It was the practical aim of his writings that made them a reflection of his actual experiences of war. Between his *Military Instructions* (1747/1748) and the *Elements of Castrametation and Tactics* (1770) lies a significant development that reflects the increasing importance of artillery during the Seven Years’ War. At first, the text of *Military Instructions* was secretly addressed to his officers only, but during the war, it fell into the hands of the Austrians and hence was published and translated into many languages. *Military Instructions* can be considered his main theoretical work. In 31 articles, the *Instructions* covers topics such as logistics, encampment, spies, ruses, and battle tactics. Frederick also wrote a well-acclaimed didactic poem titled *The Art of War* (1752). Other important thoughts on military strategy are contained in his *Political Testament* (1752), further developed on a tactical level in *Elements of Castrametation and Tactics* (1770). In his later years, he followed with some elaborations on campaigning and a range of smaller dispositions and instructions.

His writings matched with key concepts of the Enlightenment, namely, that the art of war has to be based on a professional education and solid knowledge, that war could be theoretically conceived with certain key principles, and that these abstract rules could be successfully applied to individual cases by the experienced commander. On the one hand, Frederick’s military thinking is deeply rooted in the military mentality of his time with its strong tendency to maneuver and to avoid major battles; on the other hand, it tends to promote quick and determining moves, including decisive battles, due to the special historical situation he found himself in with only a small country and limited resources. His historical and military writings also show a strong sense for contingency and hazards, phenomena that Clausewitz would later call frictions. But after all, his fame as a military genius owes more to his practical rather than to his theoretical moves.

One of Frederick’s main military principles was that his wars had to be short and decisive. This was based on the assumption that a small state like Prussia would not have the economic resources to continue a war; therefore, the enemy needed to be persuaded to make peace soon. The cultural background that determined the Prussian military

system to act the way it did was formed by pietism, paternalism, and an enlightened rationalism. Ideas of duty and service for their sovereign and the institutions of the state gave Frederick's enlightened despotism the proper authority and governmental foundation. As Frederick became a symbol for self-discipline, the Prussian army became a symbol for military discipline. Phrases like the common soldiers should "dread their own officers more than the enemy" (Luvaas, 1966, p. 16) won dubious fame. The enormous cohesion of the Prussian army was achieved not only by force but also through a system of material as well as symbolic gratifications and a paternalistic and personalized leadership that helped produce a strong identification with "the king's army." The army was the main nerve of the Prussian state. While most other European monarchies of the time invested 20% to 30% of their national budget on the military, Prussia spent almost three fourths of its economic resources on its armed forces. Frederick was no great military reformer, but he steadily increased the number of his troops and eagerly controlled their machine-like drill to improve their fire power and mobility.

Much of the success and the effectiveness of his military leadership resulted from his role as a *roi-connétable* (i.e., the king as military commander). In the 18th century, active command in the field had become a rare phenomenon among European monarchs. Karl XII of Sweden, on whom Frederick wrote a critical essay (1759–1760), had been one of the last and Frederick was only followed by Napoleon. The *roi-connétable* combined political, economic, and tactical decision making and only owed responsibility to himself. He could take risky decisions without fearing a court-martial, and his personal presence among the troops had a special charisma that motivated his men more than anyone else could. He was able to reward his soldiers immediately for brave behavior as well as to penalize and to discipline them. At a time when it was the prevailing opinion of most military thinkers and practicing generals to avoid battle by all means, Frederick went for battles again and again. His amateur-like decision making and a spirit of breaking all the rules of the traditional art of war added up to his image of an unpredictable military genius. Being short of troops in most of his important battles, he surprised the enemy with maneuvers nobody had expected.

The use of the famed oblique order in the battle of Hohenfriedberg (1745) and most famously Leuthen (1757) (and unsuccessfully tried earlier that year in the Battle of Prague and at Kolin) was not Frederick's invention. He just reemployed the antique tactic, requiring highly disciplined troops on a battleground his soldiers already knew from earlier maneuvers and in an inferior position from which the Austrians would not expect an attack. With a concentration of troops on one flank, even a weaker force could gain a local superiority. Leuthen became a myth of Frederick's tactical skill but was never repeated. At Torgau (1760), Frederick operated innovatively with two independent units but won the battle only with heavy losses. His men were heavily outnumbered by the enemy in famous victories like Rossbach (1757) as well as defeats as Hochkirch (1758) or Kunersdorf (1759), a fact that in retrospect helped fabricate the myth of tactical superiority and unrivalled discipline. Despite some remarkable victories, Frederick made lots of mistakes. He mistrusted most of his own generals and had a low opinion of enemy generals. And his behavior after some battles demonstrates anything but a disciplined commander. At Mollwitz (1741) and Lobositz (1756), he suddenly left the battlefield; after Kolin (1757), he showed strong signs of resignation only outmatched by his behavior after Kunersdorf (1759), where he desperately resigned from his command. In his *History of the Seven Years War* (1788), written in 1763–1764 but published only posthumously, Frederick established his own historical account of the war.

Views on Frederick II

After severe criticism during the wars of the revolution, when many reformers regarded him as the symbol of an outdated ancien régime mentality, Frederick found many admirers among later military leaders and thinkers, such as Napoleon and Clausewitz. Napoleon wrote comments about the wars of Caesar, Turenne, and Frederick during his stay on St. Helena. Clausewitz especially appreciated Frederick for "pursuing a great object with very limited means." In Imperial Germany, discussions about his strategy during the Seven Years' War caused a major scholarly debate between the civilian military historian Hans Delbrück and the German

General Staff. Apart from the quarrel between civil and military historiography, the main issue debated was the question of whether Frederick followed a *Niederwerfungsstrategie* (the strategy of annihilation) or an *Ermattungsstrategie* (the strategy of exhaustion). While Delbrück counted Frederick as the strategist of exhaustion, this brought him angry criticism from the members of the General Staff, who saw Frederick in one line with strategists of annihilation like Caesar or Napoleon. But even in his theoretical writings, Frederick never advocated the search for battle; his actual way of facing the enemy during the Seven Years' War owed much more to the limited options he had facing overwhelming enemy forces. The inclusion of Frederick's strategy in the so-called Schlieffen Plan had a far-reaching practical impact on the German strategic doctrine at the beginning of World War I. In the minds of the generals, Saxony turned into Belgium as they proposed to follow the Frederician example of a fast and decisive move on the right flank. Hitler and the German Wehrmacht (the name of the German military forces from 1935 to 1945) used Frederick as an example for their operations, and Hitler even hoped for a second miracle of the House of Brandenburg after Roosevelt's death in April 1945, paralleling it to Czarina Elisabeth Petrovna's death in 1762. After being ideologically exploited by Nazi propaganda during World War II, Frederick's public image faced severe damage after the war. Nevertheless, military strategists around the world, from the German Federal Armed Forces to the U.S. Army, continue to use the famous battles of Frederick II as tactical examples.

As there are few military commanders who have received such differing interpretations and appropriations over time, one of the most important tasks remains to historicize his life and his writings in the context of the 18th-century world. While the rule of Frederick II in its entirety has been described as a kingship of contradiction, the same is true for his military leadership. Charismatic guidance and intellectual competence as well as institutionalized structures, individual ambition, or contempt toward the fate of the common soldier were not mutually exclusive characteristics but two sides of the same coin. The Prussian king started with the personal intention to achieve greatness through military success and ended as a collective projection screen for

the aspirations, longings, and myths of soldiers and subjects alike who labeled him Frederick the Great.

FRIENDLY FIRE

Whether called friendly fire, fratricide, or amicide, the problem of engaging one's own forces on the battlefield is an old one. Long familiar to soldiers and students of military affairs, friendly fire became a hot public issue only during the Persian Gulf War of 1991, when 35 U.S. soldiers and marines were killed and 72 were wounded in 28 friendly fire incidents. Just more than 23% of all U.S. personnel casualties and about 77% of all U.S. combat vehicle losses in the Gulf were due to friendly fire, and other coalition forces suffered similar losses. This entry discusses aspects of friendly fire such as accountability, costs, causes, and prevention.

Accountability

Most military personnel understand that friendly fire is an unfortunate but natural part of warfare, but the media has a tendency to blow such incidents out of proportion, and an ill-informed public, increasingly isolated from the realities of war, reacts with distrust, demanding retribution and proposing remedies that may be counterproductive. The families of the victims of friendly fire display excusable anguish

and suspicion that is often translated into demands for explanations that cannot be provided with any degree of speed or accuracy and thus often provoke unwarranted charges of cover-up and malfeasance.

During the Persian Gulf War, an exception to the usual practice of not bringing formal charges against personnel involved in committing friendly fire incidents was the case of Lieutenant Colonel Ralph Hayles, an AH-64 Apache helicopter pilot who fired a missile that hit a Bradley infantry fighting vehicle on February 17, 1991, killing two and wounding six. Hayles was charged with disobeying an order and subsequently retired from the army. The public identification and punishment of a soldier responsible for a friendly fire incident was very rare. The only previous case arose from the bombing of Zurich, Switzerland, by six U.S. Eighth Air Force B-24s on March 4, 1945, that killed five civilians, wounded 12, and left 22 families homeless. The pilot and navigator of the lead plane were subsequently acquitted in a June 1945 court-martial presided over by Colonel James M. (Jimmy) Stewart, the famous movie actor.

Costs

While fratricide often extracts a high price in terms of death, suffering, and bereavement, the direct effects of friendly fire incidents on the outcome of military operations is usually negligible. Even in the worst case in World War II, the July 1944 Operation Cobra bombings that resulted in 111 killed and 647 wounded, the operation was delayed only by 2 days and was ultimately successful. From a purely operational standpoint, the psychological effects of friendly fire incidents are perhaps more important than the physical effects. Troops under friendly fire are almost certain to lose confidence in their supporting units, and overall cohesion is likely to be reduced. The current emphasis on accountability and punishment also raises the question of whether or not infantrymen, gunners, and pilots will delay employing their weapons out of fear of hitting friendly troops. In an intense combat situation, getting off the first shot may be the key to survival and victory.

Until quite recently, there were no clear reporting requirements nor any common definition of what actually constituted a friendly fire incident, and such incidents were not commonly highlighted in official reports or historical accounts. Commanders often

elected not to report combat deaths as being caused by friendly fire in order to protect what they believed to be the best interests of the victim and any survivors or to preserve morale and relationships with supporting units. Consequently, the available data on friendly fire incidents are so poor that it is simply impossible to determine the true number of such incidents with any accuracy, but a figure of around 15% to 20% of total casualties is probably "in the ballpark."

Causes

Friendly fire incidents may be caused by a variety of factors and often by more than one factor at a time. High on the list of causes are environmental factors, such as the difficulties posed by terrain, climate, and weather; poor visibility; the type of operation being conducted; and the size and pace of operations. The increased lethality, range, remote operation, and speed of modern weapons are also major contributory factors. In many respects, modern weapons have outstripped the ability of their human users to control them, and the employment of sophisticated camouflage, electronic deception, and other modern defensive technology further compounds the problem. Mechanical failures may also add to the toll from friendly fire. However, when traced to their core, most incidents of friendly fire are found to be the result of human error. Such errors take many forms on the battlefield. They include carelessness, the stress of combat (and its companion, the oft-cited "fog of war"), lack of proper training and seasoning, lack of discipline, poor fire control, poor tactical planning, and lack of coordination in and among units.

Prevention

Since the Persian Gulf War, there has been a sustained effort to identify technological solutions to the problem of friendly fire. But new technology cannot solve the problem entirely, and in view of its probable high cost-to-benefit ratio, any technological solution may prove fiscally impractical. War is a human endeavor, and the solutions to the problem of friendly fire are more likely to be human rather than technological. Increased emphasis on hard, realistic training, combat conditioning, fire discipline, good planning, and thorough coordination of operations is likely to produce better results than any expensive technological innovation.

Conclusion

Despite the focus on preventing friendly fire, since 2001, U.S. and coalition forces in both Iraq and Afghanistan have had their share of friendly fire incidents. Those incidents, which remain to be tallied and classified, have included the typical range of air-to-ground incidents and both direct and indirect fire ground incidents. The best known and most controversial case was the death of Army Ranger Patrick D. Tillman, a well-known former professional football player, in Afghanistan on April 22, 2004. The Tillman incident displayed characteristics common to many friendly fire incidents: confusion as to what actually happened; alleged misrepresentation and cover up of the incident by the army; anguish, disbelief, and criticism on the part of the bereaved family; media hype and error; and even speculation that the incident might have been murder.

and antiair warfare. Prior to 1975, frigates were ships of various sizes with the common characteristic of being smaller than a ship of the line (a warship of the 17th-19th centuries that mounted anywhere between 60 and 110 guns). Frigates have been part of the U.S. Navy since the Maritime Committee of the Continental Congress first authorized the construction of 13 such vessels in 1775 and have occupied a justified position of prominence within the U.S. Navy ever since. As of 2012, only 23 frigates remain on duty, and the U.S. Navy intends to replace all of them with the new LCS (littoral combat ship) within a decade. This entry discusses the history and classes of frigates and their features and capabilities.

Frigates, 1775-1945

While the 13 frigates of the Revolution were vastly outmatched by the Royal Navy, Congress saw the need for a permanent navy and in 1794 appropriated funds for an additional six frigates ranging in size from the 44-gun USS *Constitution* (popularly known today as "Old Ironsides") to the 36-gun USS *Constellation*. These six frigates saw extensive service against the Barbary Pirates and during the War of 1812. Newer generations of frigates, including the USS *Congress*, a 1,800-ton sailing frigate, served in both the Mexican-American and Civil Wars. While foreign navies continued to utilize frigates in the ironclad age, the U.S. Navy did not. During the Second World War, however, frigates reappeared in the American arsenal. While a handful were built by Great Britain, the majority, belonging to the *Tacoma* class, were British-designed and American-built warships that displaced 1,430 tons and were used primarily in an antisubmarine role.

Frigates and the Cold War

After World War II, the U.S. Navy continued to deploy numerous frigates, primarily to combat the rising threat from the Soviet Union's burgeoning submarine fleet. Over time, the differences in design, size, armament, and raison d'être between frigates, cruisers, and destroyers began to blur, and so in 1975, the U.S. Navy reclassified many ships with the result that the number of frigates in service dramatically declined. Most frigates were reclassified as either destroyers or cruisers, while destroyer escorts built as antisubmarine vessels were reclassified as frigates.

In 1960, Congress authorized the construction of the new *Bronstein*-class destroyer escort, designed to combat Soviet submarines worldwide. At just over

FRIGATES

For the contemporary U.S. Navy, a frigate denotes an escort ship whose primary focus is antisubmarine

2,700 tons, the *Bronstein* class carried advanced sonar, antisubmarine rockets, and 3-inch guns. In 1964, the U.S. Navy commissioned the first of the new larger and faster *Garcia*-class destroyer escorts. With 5-inch guns and built to handle both manned and unmanned helicopters, the *Garcia* represented a demonstrable improvement over the *Bronstein* class, especially after the addition of the lightweight Tartar surface-to-air missile (*Garcia*-class destroyer escorts equipped with the Tartar were known as *Brooke*-class vessels). In 1965, construction began on the first of the 4,200-ton *Knox*-class destroyer escorts. The 41 ships of the *Knox* class, which enjoyed periodic sonar upgrades as well as the eventual introduction of the Sea Sparrow and Phalanx weapons systems—both of which protect ships against incoming missiles—remained stalwart escort and antisubmarine vessels until the 1990s.

The remaining frigates on active service with the U.S. Navy belong to the *Oliver Hazard Perry* class. Commissioned beginning in the late 1970s and designed primarily as an antisubmarine warship, the 51 American built *Perry*-class vessels top out at just over 4,000 tons, have a maximum cruising speed of 29 knots, and carry an assorted weapons package that includes helicopters, torpedoes, surface-to-air missiles, and the Phalanx weapons system. The *Perry*-class proved its durability in combat when the USS *Stark* suffered major damage in 1987 after an Iraqi warplane fired on and struck the vessel with two Exocet missiles. A year later, an Iranian mine damaged the USS *Samuel Roberts*. Both vessels survived their attacks and returned to service.

Frigates Since the Cold War

In 1986, just as the number of frigates in service with the U.S. Navy peaked at 115, the office of the Deputy Chief of Naval Operation for Surface Warfare cancelled plans to replace the *Knox* class with a new, advanced frigate. Today, the U.S. Navy is developing a new combat ship designed to replace its aging frigates. The new vessel, the LCS, comes in two classes, the *Freedom* and *Independence*, and tops out at 3,000 tons. Although smaller than the *Knox*, the LCS has a maximum speed in excess of 40 knots and is equipped with the navy's new flexible mission packages, which allow for the quick addition or substitution of specialized equipment to counter various threats, as well as an enhanced, primarily defensive,

missile capability. Both classes of LCS are faster and more versatile than frigates and will counteract submarines, fast moving small surface craft, and mines. The U.S. Navy had deployed one vessel from each class as of 2012.

Frigates in Service With Foreign Navies

While frigates are fast disappearing from the U.S. Navy, other fleets still rely on the versatile and relatively cost-effective warship. Allied navies, including Japan and Great Britain, widely employ frigates. Numerically, Japan's 36 frigates (the Japanese did not reclassify their ships as the Americans did, and therefore, frigates are still referred to as destroyers or destroyer escorts) dominate the Maritime Defense Force (the 1946 constitution prohibits Japan from maintaining an army, navy, or air force). Britain, however, much like the United States, is steadily reducing the number of frigates in service as part of its Future Surface Combat Program. The British frigate replacement, the Type 26 combat ship, is similar in many respects to the new U.S. LCS.

As of 2012, the Chinese navy had the largest number of frigates with 47. Of these, nearly half belong to the two classes of Chinese built *Jiangwei* and *Jiangkai* frigates. The *Jiangwei* top out at just over 2,200 tons and carry, depending on class, a complement of surface-to-air missiles, Gatling guns, and depth charges, but on the whole lack torpedoes, helicopters, or a modern combat information center. The newer and larger *Jiangkai* class surpasses 4,000 tons and employs many advances over older Chinese models, including stealth technology.

The Legacy of Frigates

A stalwart ship of the seas, frigates have historically served roles almost as versatile as their myriad designs. In the U.S. Navy, frigates served primarily as antisubmarine vessels since World War II, and though the threat from submarines has not entirely dissipated, new threats, especially from mines and small fast attack ships, have made the frigate less vital with the effect that, while still in use in dozens of fleets, they should, by 2020, all but disappear from the register of active-duty vessels in the U.S. Navy.

GATES, ROBERT

In November 2006, President George W. Bush nominated Robert M. Gates to fill the role of secretary of defense. He replaced the outgoing defense secretary, Donald Rumsfeld, who resigned in the wake of the Democratic Party regaining control of both houses of Congress and thrusting the ongoing Global War on Terrorism to the forefront of national debate. Gates faced the enormous task of turning the wars around and modernizing the Department of Defense on a budget targeted for cuts after excessive growth over the past decade. This entry looks at the career of Gates, focusing on his accomplishments as secretary of defense in the Bush and Obama administrations.

Early Career

Gates studied history in college and earned a doctorate in Russian and Soviet history from Georgetown University. In 1966, he began what became a 27-year career with the Central Intelligence Agency that was briefly interrupted by service in the U.S. Air Force and a later career on the staff of the National Security Council and as deputy national security advisor to President George H. W. Bush. After an arduous Senate confirmation that revolved around his involvement in Iran Contra, Gates became the first entry-level employee to rise to the level of director of the Central Intelligence Agency under George H. W. Bush in 1991. In the course of his career, Gates also spent 9 years at the National Security Council, where he gained a reputation for consensus building

with both political parties. He followed his 1993 retirement from the Central Intelligence Agency with a career in education at Texas A&M University, where he later became president of the institution.

Reinventing the Pentagon

It quickly became obvious that Gates signaled a drastic change in Washington and at the Pentagon. During his nomination hearing, Gates soberly admitted that the United States was not winning the war in Iraq, a stark contrast to the previous administration's upbeat outlook. Rather than fire any aides on his arrival, Gates set out to repair relationships frayed by what critics called Rumsfeld's top-down, confrontational style. He set out to fix the friction that existed during the Bush administration between the State and Defense departments and understood that such tensions had troubled many administrations in the past. Furthermore, he proved willing to listen to and work with the new Democratic majority in Congress where his bipartisan appeal was evident through continued support for defense spending despite enormous pressures. He also made strides to meet commanders and soldiers in the field, on their turf, where he listened carefully and adjusted as necessary. He had learned many years earlier that to achieve change in resistant bureaucracies, one must start from the bottom up.

One of the largest tasks Gates needed to address concerned the institutional reorganization necessary to approach the half-decade-old wars with a new perspective. The first change occurred in February 2007, when the Walter Reed Medical Center

controversy led Gates to decisively fire army commanders responsible for the poor conditions in the hospital. Later that August, Gates removed air force leadership after controversy surrounding lost nuclear weapons and a failure to provide resources like unmanned aerial vehicle drones in Afghanistan and Iraq. Over the next year, he focused on army leadership and promoted officers, like General David Petraeus, whose innovative counterinsurgency strategies were more relevant to asymmetric warfare faced in Iraq and Afghanistan. Gates chose to empower commanders with bottom-up strategy reform where leaders owned the implementation and results of new tactics. Later, in 2010, Gates joined Joint Chiefs of Staff chairman Admiral Mike Mullen in condemnation of Don't Ask, Don't Tell (the 1993–2011 U.S. government policy toward gays and lesbians in the military), but he allowed the U.S. Congress to decide on the repeal, while he consulted the different branches of the armed forces about policies for implementation.

In January 2007, Gates agreed with the Bush administration on a troop surge to reverse the growing sectarian violence in Iraq. He had worked on the policy that introduced 30,000 new troops and extended tours during his time with the Iraq Study Group. The commanders also implemented their counterinsurgency strategy, which sought to provide breathing room for Iraqi politicians to repair fractured relationships, pass legislation, rebuild infrastructure, and train national security forces. Gates then shifted to repair relationships with regional allies and the North Atlantic Treaty Organization (NATO) as well as transfer responsibilities that fell on the military to better equipped civilians within the State Department. As secretary of defense, Gates consistently promoted the State Department and the important role he felt it should play in finding solutions to conflict abroad.

Throughout 2008, glimmers of success in Iraq were replaced with deterioration of the situation in Afghanistan. The Iraq surge appeared to work and provided time for the Iraqi parliament to make progress toward withdrawal objectives for U.S. forces. When asked to stay on as secretary of defense for the incoming Obama administration, Gates set out plans for a 2009 troop surge in Afghanistan. Together Gates and the White House implemented a surge model similar to Iraq but struggled with Pakistan's Taliban sanctuaries and Iran's interference in both wars. The following year, the United States withdrew

combat forces in Iraq and reduced the troop count to 50,000 troops set to leave in December 2011. While progress in Afghanistan teetered, Gates remained focused on preparing the Pentagon to deal with troublesome situations in Iran, North Korea, and Pakistan under renewed budget scrutiny after the global economic crisis of 2008.

Gates responded to increased concerns over the Pentagon's budgets in 2010 when he unveiled plans to reel in defense spending and optimize existing funds. Gates made a point to strike a balance between hawkish representatives concerned about a weakened military and their dove counterparts who called for deeper cuts. Initial cuts eliminated expensive conventional weapons systems, including F-22 fighter jets, navy destroyers, and marine amphibious assault vehicles totaling an estimated savings of \$330 billion over the programs' life span. He also eliminated the Virginia-based Joint Forces Command and planned cuts to the massive use of expensive defense contractors that swelled to 30% of the defense department's employees. Later in 2010, the White House demanded further cuts, and Gates produced \$78 billion more in reductions through a policy to reduce troop counts to 2007 levels and curb increased costs of the Pentagon's TRICARE health program. Although he initiated many of the cuts, Gates argued the need for defense investment and suggested that the nation's fiscal crisis could not be resolved by defense cuts alone.

While budgetary arguments loomed, the Pentagon under Gates made significant headway toward modernizing weapon systems and strategy for future asymmetrical conflicts. In his first year, Gates replaced seriously vulnerable Humvees with mine resistant ambush protected armored vehicles to protect soldiers from roadside bombs and improvised explosive devices. He also pushed for expanded implementation and funding that tripled the number of unmanned aerial vehicle drones. Additionally, many of his planned cuts will reinvest savings in new, less expensive weapons systems to help troops fight future wars. Gates has steadily promoted diplomacy, especially with China, but many new programs will seek to augment the U.S. military's edge as new countries rise to challenge American military superiority. Two projects that Gates began in 2011 included long-range bomber development and technology to combat antiship missiles that threaten the nation's carrier fleets.

Final Year and Departure of a Statesman

In February 2011, the Arab Spring of revolution that swept through Tunisia and Egypt finally reached Libya and its longtime dictator Muammar Qaddafi. After Qaddafi's air force bombed civilians, the United States, NATO members, and allies intervened with sanctions and a no-fly zone. While Gates initially fought against a politically unpopular intervention in a new war, the Obama administration decided to intervene. Gates's very close working relationship with Secretary of State Hillary Clinton showed in the days that followed as they worked together to support NATO operation Unified Protector.

Later, on May 1, the Obama administration announced the death of al Qaeda leader Osama bin Laden. American defense and intelligence organizations learned of bin Laden's location the previous year, and Obama approved a special operations raid that killed bin Laden in a compound located in Abbottabad, Pakistan. The operation was conducted in near-complete secrecy as the U.S. government did not notify the Pakistani authorities of the mission

conducted inside Pakistan's borders. Ever careful of his words, Gates tiptoed around implications of Pakistan harboring America's most wanted criminal and troubles in Afghanistan that worsened an increasingly strained relationship between the two countries.

After numerous successes, Gates decided to retire in July 2011, his legacy as secretary of defense shining with accolades. He had firmly supported a reinvention of the Department of Defense, forged strong civil-military relationships, and helped lead America's military through some of the toughest conflicts in recent history. As he left, the consensus builder warned the nation of dysfunction in America's political system. To allies in NATO, Gates appealed for improved sharing of the global security burden as the U.S. debt crisis signaled potential for a diminished presence in future global conflicts.

GAYS AND LESBIANS

The subject of lesbians and gays in the military is a highly contentious one; many people have strong opinions, though a much smaller number fully understand the history of lesbian and gay service. The U.S. military has a long record of homosexual service members, but it has often overlooked (frequently intentionally) or disparaged their presence. Legal challenges to exclusion and separation of lesbian and gay personnel arose by the early 1980s, and in 1993, the military inaugurated the policy known as Don't Ask, Don't Tell (DADT). After thousands of discharges under various policies and the repeal of DADT (which was equally contentious), the status of gays and lesbians in the military is still in limbo. The historical debate has been driven by stereotypes, misconceptions, and strongly held beliefs, but the fact remains that gays and lesbians have served and continue to serve in the armed forces. This entry discusses the history of gays and lesbians in the U.S. military and the attempts to screen for and regulate homosexual behavior.

History

Sodomy, usually defined as anal and sometimes oral sex between men, and now including between a man and a woman, was considered a criminal offense as early as 1778, when the first soldier was drummed out of the Continental Army. Many of the most

pertinent paradigms and official policies concerning military homosexuals have only occurred within the past 100 years, however. Since World War I, gays and lesbians have been prohibited from serving in the armed forces through either personnel regulations or the application of the sodomy provisions of military law. Early attempts to regulate homosexual behavior within the military were sporadic and amorphous, probably in large part because the cultural climate of the time inhibited discussion of sexual or "perverse" matters as indelicate. Margot Canaday points out, however, that a great number of army and navy records produced both during and after the First World War, reveal a military establishment well acquainted with homosexuality within its ranks. The Articles of War of 1916 went into effect on March 1, 1917, the first complete revision of military law in more than 100 years and the first legal document to address the incidence of "sodomy" within the military population. Its first mention of sodomy in military law occurred in Article 93, which prohibited assault with the intent to commit sodomy. A 1920 revision of the Articles of War treated sodomy as a separate offense, which did not change until 1951.

Between the two world wars, the military tried to screen and exclude homosexual men from service by using contemporary biological theories about the causes and manifestations of homosexuality. Army regulations produced in 1921 included "stigmata of degeneration," which attempted to describe "overly feminine" men as having sloping shoulders, broad hips, and an absence of secondary sex characteristics, including facial and body hair. Criteria for exclusion of individuals for service also incorporated the "degenerative characteristic" of "sexual psychopathy," which included sexual relations between men. Although there was official policy during the interwar period that homosexuals required court-martial under the Articles of War, the military more frequently discharged them administratively under a "Section VIII" discharge for unsuitability. Theoretically, while these could be honorable discharges, discharges in case of psychopathic behavior usually fell under the category of "less than honorable," or "blue," discharges, due to the paper on which these discharge forms were printed. Until World War II, however, there was no explicit bar against homosexuals in the service.

With World War II, the prewar practice of separating gay men from service became part of army

regulations, although with great debate: There were 24 separate revisions of regulations concerning homosexuality between 1941 and 1945. Treatment of individual cases of homosexuality varied widely in the military, and military authorities began to consult with psychiatrists and other medical personnel to develop evaluation procedures for the 18 million men examined for induction during the course of the war. The army and navy, however, had already determined that overtly homosexual behavior disqualified entry into the military. *Homosexual* replaced *sodomist* as the term of choice in discussing both legal and criminal aspects of same-sex behaviors, though the military had not yet defined or clarified these aspects. Even if a service member had not engaged in sexual activity, a growing body of policy maintained the view that evaluators could identify homosexual personalities, either to deny these men induction or to seek their separation on discovery. Service members who engaged in same-sex behaviors could further separate from the service through their resignation or by administrative discharge. The pioneer sex researcher Dr. Alfred Kinsey's wartime surveys suggest that at least 650,000 and as many as 1.6 million male soldiers were homosexual.

After the war, a 2-year liberalization of policies concerning lesbian and gay personnel, increasing the likelihood of honorable discharge, was reversed in 1948. In 1949, the Department of Defense (DOD) issued a memorandum unifying military policy toward homosexual behavior, which prohibited lesbians and gay men from service in any branch of the armed forces in any capacity. The memorandum also made prompt separation of "known homosexuals" mandatory; this policy foreshadowed President Dwight D. Eisenhower's 1953 Executive Order 10450, which codified "sexual perversion" as grounds for dismissal from federal employment. Although the armed forces did not keep consistently reliable statistics on reasons for discharge, the numbers of dismissals from both the military and from federal service rose to 10 times their wartime rate, despite the vastly smaller postwar army.

In the late 1950s and early 1960s, the military continued to separate lesbians and gays. The DOD revised policy in 1959, issuing a directive that among the reasons for administrative discharge for "unfitness" was "sexual perversion," including homosexual acts and sodomy. This remained DOD policy throughout the 1960s (changed in 1975 to

include "homosexual acts or other aberrant sexual tendencies"). In 1965, however, a directive allowed personnel facing less-than-honorable discharge to present their cases before administrative discharge boards and to have legal representation. Prior to the directive, most service members accused of homosexuality cooperated without protest to avoid more severe punishment and/or to protect others, as accused members were often pressed for the names of sexual partners or other gay or lesbian acquaintances in the military. Moreover, as need for troops in Vietnam increased, DOD paradigms concerning draftees required those seeking deferment for homosexuality to submit "proof"—signed affidavits from sex partners or the sworn statement of a psychiatrist—as many men sought to avoid the draft by making such claims. The journalist Randy Shilts notes, however, that at that time, in 49 of the 50 states, confessing to a homosexual act was to confess to a felony, sometimes punishable by up to 20 years in prison. Inconsistency in standards, required documentation, and administrative procedures thus prompted a review of discharge policy and procedures during the Carter administration.

New DOD directives in 1981 reflected the results of the review, outlining that any service member who had "engaged in, has attempted to engage in, or has solicited another to engage in a homosexual act" (National Defense Research Institute, 1993, p. 40) was subject to mandatory discharge. It regulated for the first time that "homosexuality is incompatible with military service" (National Defense Research Institute, 1993, p. 40) and explicitly maintained that the presence of homosexuals adversely affected order, discipline, morale, and trust among the troops. It also asserted that homosexuality in the military impinged on recruitment and retention of new members, public acceptability of armed service, and national security. Despite increasing legal challenges, this policy remained in place until January 1993, resulting in more than 1,400 discharges per year.

The armed forces have also used the sodomy provisions of the Uniform Code of Military Justice to discharge lesbians and gay men from the service. The use of the Uniform Code of Military Justice in this manner evolved despite observations from many quarters, military and civilian, that noted that human sexuality falls along a scale created by Dr. Kinsey in his highly regarded sex research. This 0 to 6 scale measured homosexual behavior, with

0 indicating complete heterosexuality and 6 indicating complete homosexuality; many people who identify as heterosexual participate in behavior that could be classified as homosexual. Furthermore, Kinsey's research on the human male (1948) and female (1953) provided a highly complex view of sexuality in the postwar era that the public had not encountered prior to that time.

Additionally, the military has historically applied sodomy laws and regulations unequally to homosexual and heterosexual service members, although both groups widely practice the prohibited behaviors. According to a study produced at the direction of Defense Secretary Les Aspin, under military law the act itself is forbidden, regardless of the participants; heterosexual as well as homosexual sodomy has been banned but continues in both populations.

The Palm Center, a think tank concentrating on issues of gender, sexuality, and the military, summarizes the results of 20 studies, articles, and papers, many produced by government sources. These studies have concluded that sexual orientation alone is "not germane" in determining who should serve and that unit cohesion, morale, and organizational effectiveness would not be affected if gays and lesbians served openly. Studies also found no evidence showing that gays were unsuitable for military service and suggested that policy requiring their exclusion or separation from the armed forces was unnecessary and damaging. One report pointed to growing tolerance of homosexuality and concluded that "the military cannot indefinitely isolate itself from the changes occurring in the wider society, of which it is an integral part" (Sarbin & Karols, 1988). Another report found that "the preponderance of the evidence presented indicates that homosexuals show preservice suitability-related adjustment that is as good or better than the average heterosexual," a result that appeared to "conflict with conceptions of homosexuals as unstable, maladjusted persons" (McDaniel, 1989, pp. 24, 26).

In examining analogous foreign militaries, the Government Accountability Office studied 25 countries, with special focus on Israel, Canada, Germany, and Sweden, and related the opinion of government officials that the presence of homosexuals in the military is not an issue and has not created problems in the functioning of military units. A study by the RAND group also examined other countries, including Canada; none of the militaries of other countries

studied for the report believe that their effectiveness as an organization has been impaired or reduced as a result of the inclusion of homosexuals, despite the fact that homosexuality was still not widely accepted in those countries.

The Palm Center further conducted its own studies of openly gay service in Britain, Israel, Canada, and Australia and concluded that not one person had observed any impact or any effect at all that undermined military performance, readiness, or cohesion; led to increased difficulties in recruiting or retention; or increased the rate of HIV infection among the troops. It further found that although many heterosexual soldiers objected to homosexuality, the military's emphasis on conduct and equal standards was sufficient for encouraging teamwork without undermining cohesion. In July 2008, a bipartisan panel of retired generals and admirals, which studied the issue for more than a year, released "The Report of the General/Flag Officers' Study Group." The officers found that lifting the ban on gay/lesbian service is "unlikely to pose any significant risk to morale, good order, discipline, or cohesion" (Flaherty, 2008).

Current Debate

Current debate about lesbians and gays in the military, generally within the context of the lifting of the DADT policy, centers in part on whether the "political correctness" of allowing homosexual people to serve trumps the rights of heterosexual military members to serve in what they perceive as an unmolested environment. Additionally, even though DADT has been repealed, in order for gay/lesbian service members to escape legal punishment, the Uniform Code of Military Justice would also have to be altered to reflect changes in definitions of sodomy. Moreover, current policy against lesbian/gay service is somewhat abstract, as even a statement that one is homosexual is construed as a "homosexual act" under that policy, interpreted to mean that the person making the statement intends to commit other homosexual acts of a bodily nature. Gender figures into the discussion, as well, with a larger percentage of lesbians than gay men being discharged.

The debate about lesbians, bisexuals, and gay men in the military continues, with many younger heterosexual servicemen and servicewomen at far greater ease with their homosexual and bisexual counterparts than might have been believed even at

the start of DADT. The advent of repeal and certification of the repeal of this policy indicate the government's implementation of the next stage of equality for military personnel in the United States.

GENERAL DYNAMICS

General Dynamics is, as of Fiscal Year 2011, the fourth largest American defense contractor. Formed by the 1952 merger of Electric Boat shipbuilding and Consolidated Vultee aircraft, General Dynamics produces or has produced the M-1 tank, the F-111 and F-16 aircraft, and many of the *Los Angeles*-, *Ohio*-, *Seawolf*-, and *Virginia*-class submarines. Currently, General Dynamics' portfolio includes four major divisions: (1) aerospace, (2) combat systems, (3) information systems and technology, and (4) marine systems. The firm remains a leader in land, air, and information-based technology. This entry examines the history of General Dynamics and discusses current products.

History

General Dynamics emerged from the union of two powerful defense contractors: Electric Boat and Consolidated Vultee aircraft. Electric Boat traced its origins to the last years of the 19th century, coming

to prominence through the company's development of submersibles. Electric Boat grew and prospered on that basis through the early decades of the 20th century, producing submarines for the U.S. Navy through World War II. Consolidated Vultee (also known as Convair) emerged from the union of two influential aircraft producers in 1943. Consolidated Aircraft had produced a number of influential aircraft, including the B-24 Liberator of World War II fame, while Vultee produces trainers for the U.S. Air Force, among other designs.

After the merger, General Dynamics continued to expand its portfolio, producing submarines and aircraft that played a crucial role in the Cold War, including the B-36 Peacemaker bomber, the F-102 and F-106 interceptors, the Atlas missile, and the USS *Nautilus*, the navy's first nuclear submarine.

One of General Dynamics' controversial products, however, was the F-111. The F-111 arose out of the air force's desire for a fast low-level tactical bomber and the navy's desire for a supersonic high-altitude long-range patrol aircraft in the late 1950s. In February 1961, Secretary of Defense Robert McNamara ordered the two services to create a single set of requirements to fill the two disparate roles and solicit bids for a single design to fill the need—the TFX (Tactical Fighter Experimental). By January 1962, the two main contenders were Boeing and General Dynamics. The Boeing design was innovative and their bid lower, but after several delays, revisions to the requirements, and interservice disagreements, McNamara overruled the Pentagon and awarded the contract to General Dynamics. Citing concerns about the usefulness of the final design to carrier aviation, the navy backed away and turned to Grumman, a move that eventually produced the F-14. General Dynamics' decision to locate their plant manufacturing the F-111 in Vice President Lyndon B. Johnson's home state of Texas also allowed Johnson to claim credit for the jobs thereby created. Ultimately, the F-11 proved a versatile and useful airframe, serving in a variety of roles for the air force throughout the last decades of the Cold War.

Following the mixed success of the F-111, General Dynamics' next major aerial success was the F-16 Fighting Falcon. General Dynamics won a 1972 competition for a new lightweight fighter, and subsequently it put the F-16 into production in 1975. Eventually, more than 4,000 F-16s would be produced, making it one of the most successful aircraft

of the post-World War II era. In recent years, General Dynamics has broadened its portfolio to include landing systems and Gulfstream commercial aircraft.

Today, General Dynamics also produces a variety of land-based systems, including the M-1 Abrams main battle tank, the Stryker LAV (light armored vehicle), and MRAP (mine resistant ambush protected) wheeled vehicles. Ordnance has also become a focus, with the corporation producing a variety of bomb bodies; small, medium, and large caliber munitions; propellants; and nonlethal products.

Submarines also continue to form a large part of General Dynamics' portfolio. Designers in the Electric Boat shipyards played a pivotal role in designing and building the first American nuclear submarine, the *Nautilus*, placing them ahead of rival Newport News Shipbuilding to build the nuclear navy. In the early 1970s, Admiral Hyman Rickover expressed concern over the immense number of new Soviet attack submarines in production, and he pushed for a new American design to counterbalance them. Rickover, apparently hoping to control General Dynamics by reminding it that it was not indispensable, pressured Newport News Shipbuilding to bid on the contract. Newport News designed the 688- or *Los Angeles*-class submarine, but since Electric Boat was the only other shipyard able to build nuclear submarines, General Dynamics was awarded a large share of the fixed-price contract.

The shipyards were also suffering from the problems of major expansion, in the form of an influx of unskilled workers, as well as the general unrest in the American economy, and production difficulties mounted while profits fell. Based on the need to project costs far into the future under Total Package Procurement (a U.S. government policy whereby the development, production, and support of a system were contracted for as a total package, with price commitments), Electric Boat's cost overruns led to a 1977 contract claim for \$544 million. Political fallout for such a large payout to a major contractor dovetailed with Rickover's claim that civilian shipyards placed profit over quality and led to an investigation of fraud against General Dynamics. Eventually, P. Takis Veliotis took over and revitalized Electric Boat, but this caused another major scandal in 1980 when the navy found substandard steel being used in the construction of the USS *Bremerton*. Veliotis defended himself in congressional hearings, but he resigned suddenly in 1982 and returned to

his native Greece just ahead of a fraud indictment in 1983. Veliotis then produced documents alleging widespread fraud at General Dynamics, leading to another inconclusive investigation.

In recent years, however, Electric Boat has enjoyed considerably more success. The firm produced the *Ohio*-class ballistic missile submarine and the more recent *Seawolf*- and *Virginia*-class attack subs. Electric Boat continues to be the leading submarine manufacturer for the U.S. Navy.

The Future

The end of the Cold War meant uncertainty for General Dynamics as for all military contractors. While the American focus on technology as the cornerstone of defense remained largely intact, the scale of the military establishment declined as fears of Soviet aircraft, submarines, and tanks declined. General Dynamics adapted by emphasizing battlefield information systems as part of the overall push to make the small volunteer force as efficient as possible. In December 2008, General Dynamics was contracted to build 14 of the third block of the *Virginia*-class attack submarines. The company press release portrayed the contract as a way to create jobs in troubled economic times, suggesting the crucial role defense contractors still play in American political, military, and economic life.

GENEVA CONVENTIONS

In popular usage, *Geneva Conventions* refers to a body of agreements aimed at setting international standards of warfare. Begun in 1864 as a mutual

accord regarding treatment of the wounded and medical personnel, the convention grew in complexity by the early 21st century, addressing new technologies, prisoners of war, broader issues of human rights, and noninternational conflicts. International bodies, most notably the International Committee of the Red Cross (ICRC) and the United Nations, have been instrumental in shaping the convention. From the beginning, a tension has existed between enforcement of the convention's provisions and respect for the sovereignty of individual states. This entry discusses the background of the Geneva Conventions and the content of the conventions and agreements from 1864 to the present, including applications to the Global War on Terrorism.

Development

Background

In the mid-19th century, a rising concern for humanitarianism in warfare spread among the publics of Europe. Much of this interest stemmed from Florence Nightingale's well-publicized experiences as a nurse in the Crimean War, combined with the efforts of the Swiss philanthropist Jean-Henri Dunant, whose observations of the Italian war for unification convinced him of the need to codify international norms. As Nightingale called for improving conditions in military hospitals, Dunant emphasized the need to ensure the safety of those transporting the wounded from the battlefield. Public interest sparked the creation of national societies—which became the Red Cross organizations—as well as a Geneva-based movement that became the International Committee of the Red Cross. The latter opened the dialogue through a preliminary meeting in Geneva, Switzerland, in 1863. A year later, the Swiss Federal Council invited states from Europe and the Americas to participate in a larger conference.

The 1864 Conference

The conference convened in Geneva on August 8, 1864, with representatives from 15 European countries. On August 22, it produced the Convention for the Amelioration of the Condition of the Wounded in Armies on the Field. Key stipulations were the care of wounded, regardless of nationality; the neutrality of hospital and ambulance personnel; and the

visual display of a “red cross on a white ground” to designate such personnel. A second conference in October 1868 adapted existing agreements to maritime warfare, although it was never ratified. The First Geneva Convention was ultimately ratified by 57 states, including the United States, in 1882.

Early Adaptations

The Franco-Prussian War of 1870 exposed several flaws in the First Convention, including the abuse of the Red Cross designation by scavengers. The Swiss government convened another conference in 1906, attended by 35 states, to revise and expand the Geneva agreements of 1864. The revised document placed voluntary aid societies within the frame of military regulations. New provisions also required victors to provide lists of the dead, as well as their personal effects, to other belligerents. Notably, the delegates qualified their revisions by creating reasonable allowances for military necessity. Their final product, the Second Convention for the Amelioration of the Condition of the Wounded and Sick in Armies in the Field, was signed in July 1906, taking effect in August 1907.

The Second Hague Peace Conference, held in October 1907, adapted the Geneva Convention to maritime warfare. It also created provisions on new technologies and prisoners of war. It became effective in January 1910. In 1925, a meeting was convened in Geneva to solidify international rules on new weapons, including those employed in the First World War. The Geneva Protocol for the Prohibition of the Use in War of Asphyxiating, Poisonous or Other Gases, and of Bacteriological Methods of Warfare took effect in February 1928, providing a basis for all subsequent restrictions on weaponry.

The 1929 Conference

While the Second Convention required enemy sick and wounded to be treated as prisoners of war, no articles covered captives as a whole. A conference took place in Geneva in July 1929 to create a third Convention relative to the Treatment of Prisoners of War, building on the provisions of the Hague Conference of 1907. It called for prisoners’ humane treatment and their swift evacuation from the battle area, and it created guidelines for work, discipline, and repatriation.

The delegates also revised the Convention for the Amelioration of the Condition of the Wounded and Sick in Armies in the Field. It now recognized the red crescent, and the red lion and sun as designations for medical personnel, as well as providing for the use of medical aircraft. The new convention gained 61 signatories between July 1929 and its revision in 1949. The ICRC proposed a conference in 1940 to address issues of medical aircraft and the treatment of enemy civilians, but the Second World War precluded it.

The 1949 Conference

Sixty-three nations sent delegates to Geneva in April 1949 to combine the existing Geneva and The Hague agreements and adapt the convention to the experiences of the Russian Civil War, the Spanish Civil War, and the Second World War. A commitment to fundamental rights was evident in the wake of the Nuremberg Trials, which prosecuted German war criminals after World War II. Additional impetus came from the UN Universal Declaration of Human Rights, adopted in 1948. Reflecting on the experiences of partisans in occupied Europe, the delegates set out to guarantee new guidelines for the treatment of civilian populations, including resistance forces. They also sketched preliminary provisions for “noninternational” conflicts taking place within a single state.

The convention now comprises four distinct agreements: (1) the First Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field; (2) the Second Geneva Convention for the Amelioration of the Condition of Wounded, Sick, and Shipwrecked Members of Armed Forces at Sea; (3) the Third Geneva Convention relative to the Treatment of Prisoners of War; and (4) the Fourth Geneva Convention relative to the Protection of Civilian Persons in Time of War.

Subsequent Protocols

Events in the 1960s, including the Vietnam War and the Arab-Israeli conflict, spurred the ICRC to call for additional conventions. Its 1973 proposals evolved into two protocols, signed on June 8, 1977. Article 1 of the Protocol relating to the Protection of Victims of International Armed Conflicts expanded the definition of international warfare to include

wars against “colonial domination and alien occupation” and violence perpetrated by racist regimes. Article 60 included “zones under special protection” from attack and included provisions for noncombatants. The Protocol relating to the Protection of Victims of Non-International Armed Conflicts significantly expanded the application of international law to internal warfare, although concerns over state sovereignty limited its scope. It required basic protections for civilians, the sick, and the wounded. Protocol III, signed in 2005, allowed the use of the red crystal, a diamond shape, as a designation for medical personnel. The purpose was to extend protections to Magen David Adom, Israel’s emergency medical service.

Enforcement and Sovereignty

The initial basis for enforcing the laws of war was reciprocity. It reflected a pragmatic focus on conflict between sovereign states. The assumption was that a signatory nation would act appropriately because if it did not, it opened itself to reprisals from the enemy. The inherent problem with such a concept was a lack of consistency in determining appropriate reprisals. In addition, the ICRC opposed reprisals because they punished one group of individuals for the deeds of another. Convention signatories could not agree on appropriate provisions, however, citing military necessity. As a result, no such stipulation entered the Geneva Conventions before the 1929 Convention on Prisoners of War, which forbade reprisals against captives. That year’s meeting also introduced a new means of enforcement, a “protecting power” to represent a belligerent by observing its soldiers in captivity and issuing complaints on its behalf. This structure allowed for better communication, although its effectiveness was dubious in that it required the consent of three sovereign states: (1) the protecting power, (2) the captive’s state, and (3) the captor’s state.

The widespread infliction of reprisals on civilians in the first half of the 20th century, including aerial bombings and punishment of enemy populations, bolstered the case for broader protections. The 1949 Convention relative to the Treatment of Civilians banned reprisals against noncombatants, including collective punishment, taking hostages, and pillaging. The 1977 protocols extended prohibitions further to reprisals against “civilian objects.” Critics

argued that these protections for resistance fighters infringed the occupier’s right to act out of military necessity. In practice, belligerent states after 1949 tended to define conflicts in ways that skirted these restrictions.

After 1949, Articles 146 and 147 of the Fourth Convention used the power of signatory states to punish “grave breaches” of its provisions: “willful killing, torture or inhuman treatment, including biological experiments, willfully causing great suffering or serious injury . . . and extensive destruction and appropriation of property, not justified by military necessity and carried out unlawfully and wantonly.” The convention called for belligerent parties to prohibit grave breaches by law and, in wartime, to agree on an umpire who would oversee procedures for prosecution. In 1977, Protocol I added to the number of grave breaches and required signatories to participate in extradition procedures and fact-finding commissions. Individuals committing breaches were subject to trial, as were their superiors, and their governments were liable to pay compensation. Enforcement had thus evolved to address both states and the individuals within them.

Terrorism

Terrorism, which usually involves violence committed by a nonstate actor on citizens of a state, has presented an additional problem for the Geneva Conventions. Beyond Protocols I and II, which prohibit acts of terror “at any time and in any place whatsoever,” there is no explicit language dealing with terrorism or appropriate responses to it. In what has been called the Global War on Terrorism, the complexity is evident. Those fighting on behalf of the Taliban in Afghanistan were attached to a state and were therefore covered under the Third Geneva Convention relating to prisoners of war. For members of al Qaeda, the lack of state affiliation suggested that they would be subject to criminal proceedings. Both the Third Convention and Protocol I do stipulate, however, that a prisoner whose status is unclear should be treated as a prisoner of war until a ruling by a tribunal.

Within the United States, the status of detainees as part of the Global War on Terrorism has brought much attention to this problem. The George W. Bush administration classified suspected

terrorists as “unlawful enemy combatants,” thereby declaring them to be unprotected by the Geneva Conventions. Under this designation, it held detainees for indefinite periods of time and used military commissions to try their cases. The administration’s supporters argued that both the convention and regular criminal procedures were inadequate to address the problem of a sustained campaign of violence against the United States and other countries by nonstate actors. Opponents of this approach argued that it contained inherent contradictions, such as the disregard of Afghan fighters’ attachment to a belligerent nation during a professed state of war. In *Hamdan v. Rumsfeld* (2006), the U.S. Supreme Court sided against the administration, arguing that the military commissions violated both the Uniform Code of Military Justice and Common Article 3 of the Geneva Conventions, which required regular judicial procedures in all cases of noninternational conflict. In response, Congress passed the Military Commissions Act of 2006 to authorize the administration’s practices. Two years later, the Supreme Court declared a portion of this law to be unconstitutional in that it suspended the writ of habeas corpus, but it left the remainder of the law in place. The controversy of the Global War on Terrorism well illustrates the ongoing challenge of adapting the laws of war in an increasingly complex global setting.

GENOCIDE

Without question, the 20th century has been permanently scarred by genocides. That is not to say that genocides have not occurred in earlier times; one need only to look at Imperial Rome during the Jewish uprising in ancient Palestine to find government-sponsored violence against a particular group of people. The extensive killing of Armenians at the hands of the Ottoman Turkish government was the first “modern genocide” of the 20th century, and showed how thorough, systematic, and widespread mass exterminations could be when a government was behind the planning. This entry provides an overview of 20th-century genocide and discusses the UN Genocide Convention.

It was the knowledge of Enver Pasha’s Ottoman Turkish Empire’s attempt to wipe out the Armenian population that inspired a Polish-Jewish jurist, Raphael Lemkin, to try to formulate a concept that would explain what he believed the National Socialist regime was attempting to do to the Jewish population of Europe. To Lemkin, the word *genocide* came closest to what he saw happening during World War II. Taking the root *genos* from the Greek term for family, tribe, or race and combining it with *cide*, from the Latin *occidere*, to kill, he coined the term *genocide* in 1944 in his work *Axis Rule in Occupied Europe*. After the war, Lemkin went on to campaign for a set of international laws that would provide a legal framework for the crime of genocide. In 1948, Lemkin was the leading advocate for the creation of the UN Convention on the Prevention and Punishment of Genocide, generally called the Genocide Convention. Although Lemkin’s original definition of genocide included the political and/or cultural destruction of a people, the Genocide Convention produced a narrower legal framework and was made the UN Genocide Convention on December 9, 1948.

Under the UN Genocide Convention, genocide is considered to include “any acts committed with the intent to destroy, in whole or in part, a national, ethnical, racial or religious group.” The convention specifically covers infliction of physical or mental harm to members of the group, forcible removal of children to another group, the creation of conditions that will bring about the physical destruction of the whole or part of the group, and murder. The most disputed portion of the UN Genocide Convention is with the phrase “the intent to destroy.” “Intention” is often quite difficult to prove, since even in many modern cases of genocide, no written, direct orders were given. Instead, it falls to the historian to make connections within the chain of command, tracing the interplay between the actual killers and those in powerful positions issuing the actual orders to destroy.

To many legal and academic scholars (and to Lemkin at the time), the UN Genocide Convention falls short in that it fails to consider members of social or political classes marked for eradication, such as the Kulaks under Stalin’s Soviet Union. In other cases, the framework does not allow for the destruction of a culture, such as the Tibetan peoples of China. Despite its perceived deficiencies, the UN Genocide Convention does provide a working definition of genocide, and all 140 countries that have signed the convention are required by international law to prevent and to punish acts of genocide. In addition, the UN Genocide Convention has been put into place in the International Criminal Court, created in 2002, and ratified in 2007 by 104 states. Although these statistics seem impressive, it was 1988 before the United States agreed to the convention, and to date, the United States refuses to recognize the jurisdiction of the International Criminal Court. Despite these drawbacks, in 1998 the International Criminal Tribunal for Rwanda found the country’s former Prime Minister, Jean Kambanda, guilty of genocide, marking him as the first person to be found guilty under the UN Genocide Convention’s terms.

Many nonacademics tend to believe that National Socialist leaders tried at the International Military Tribunal at Nuremberg were convicted of planning and carrying out genocide, but they were not. The legal language of the Genocide Convention clearly stated that crimes committed before the convention was ratified (in 1951) could not be prosecuted, and

therefore, no Nazis were ever convicted of the crime of genocide, despite there being very little question that the regime practiced a planned policy of genocide. To Adolf Hitler and his Nazi colleagues, racial theories “proved” that the Jews represented the gravest threat to German racial purity and to the creation of a *Volksgemeinschaft* or “people’s community.” It is also important to note that Nazi racial thinking was flexible enough to target other groups of people for annihilation if they were perceived to pose a potential threat to the Aryan people’s ideal community. Those also not included in the *Volksgemeinschaft* were physically and mentally handicapped people, the “work shy,” prostitutes, the Roma and the Sinti, and even some political prisoners. Although genocide was directed from the central leadership in Berlin, the process involved thousands of people who had accepted the need to classify individuals according to categories of race and racial health. In many respects, the Nazi regime’s actions most clearly correspond to the definition of genocide, whereby a government clearly demonstrated its intent to physically and culturally destroy a defined group of people, but of course, it would not be the last attempt by a government to commit genocide.

In 1975, Cambodia, ravaged by war and seething with a discontented population, experienced the Khmer Rouge revolution. Spurred on by a quick victory, Khmer Rouge leaders, including Pol Pot, claimed that the Khmers were a superior race among Southeast Asians, and they began forced evacuations of urban people, collectivization drives in the agrarian sector, reclassifications of the population, and massive, deadly purges. By 1979, the leadership of the Khmer Rouge had killed approximately 20% of the Cambodian population in their drive to be ruthless and efficient, separating children from parents and killing any potential opponents of their regime. Much like the Nazi regime, not only were people physically destroyed, so too were thousands of years of cultural heritage obliterated in the destruction of Buddhist temples and Catholic churches.

In the 1980s and 1990s, the former Yugoslavia degenerated, not into revolution as had happened in Cambodia in 1975, but rather into war, “ethnic cleansing,” and ultimately, genocide. Like the Khmer Rouge and the Nazis, Serbian nationalists wanted to create a “pure” Serbian state and society. In 1987, Slobodan Milosevic encouraged Serbians to reclaim

their historical rights to land, and he tapped into a sense of nationalism filled with resentment over all past injustices supposedly carried out against Serbs by Croats, Slovenes, and Muslims. Serbia was largely portrayed as the victim of all victims in all of history. Like the Nazis and Khmer Rouge leaders, Serbian officials began their own process of classification to determine who would be eligible for privileges and who would be displaced and/or killed. Serb nationalists, led by Milosevic, did not bother with fine details. Muslims were marked for death; Croats were marked for violent mistreatment. Place names such as Srebrenica and Kosovo came to symbolize all of the genocidal violence that Milosevic's government could unleash. Sexual violence against Muslim women and girls was also used as a means of destroying Muslim identity, family, and community life as the ultimate humiliation. At The Hague Tribunal, Slobodan Milosevic and some of his coconspirators were found guilty of genocide due to the wording of the Genocide Convention, "the intent to kill, in whole or in part" a portion of the Muslim community.

Despite the threat of legal action, genocides continue to erupt in modern societies. Beginning in 1994, the world witnessed massacres of men, women, and children in the African nation of Rwanda. At first, journalists and members of the United Nations labeled the mass killings as "genocide in part"; however, with half a million Tutsis murdered, and the drive on the part of the government and the Hutu people to exterminate every last Tutsi, it soon became clear that Rwanda also fit the category of genocide in whole. Unlike many reports of the late 1990s that tended to interpret the violence as "age-old tribal enmity," scholars of Rwandan history point to European-created false categories between Tutsi and Hutu peoples. German and Belgian imperial colonizers labeled the tall, slim Tutsi as a foreign-born people who had conquered the shorter Hutu. This explanation became ingrained in Rwandan society as Belgian administrators chose to favor the Tutsi and use the Hutu as forced labor. This castelike system remained in place until the 1959 uprising of the Hutu, calling for an end to Tutsi domination. By 1961, Rwanda was officially declared a republic, but in reality, the Tutsi were now excluded from political positions and thousands of Tutsi fled to neighboring nations, marking them as potential traitors to the Rwandan nation.

The genocidal campaign of Hutu against Tutsi erupted in April 1994 when the plane of Rwanda's president Juvénal Habyarimana was shot down. As in the cases of the Khmer Rouge and the Turkish campaign against the Armenians, the Hutu-led government marked the Tutsi as a foreign, traitorous presence that needed to be eliminated. The elites of the government found the Hutu population willing to cooperate in the brutal murders using machetes, hoes, and other implements to kill their Tutsi neighbors. In this respect, the Hutu genocidal campaign differed from the Nazi Holocaust in that there appeared to be no end to willing Hutu participants in the murder of their neighbors.

Unfortunately, today scholars and legal experts alike can point to numerous cases of genocide such as the killings in Cambodia under the Khmer Rouge, the "ethnic cleansings" in Bosnia, and the cases of modern genocide in Rwanda and in the Darfur region of Sudan, to name but a few. Unfortunately, the mantra of "never again" that followed public awareness of Nazi crimes in the Holocaust has failed to prevent outbreaks of genocide in subsequent generations.

GERMANY

Germany is a country located in western Europe. It has a common border with nine countries: Austria, Belgium, the Czech Republic, Denmark, France, Luxembourg, the Netherlands, Poland, and Switzerland. Germany covers an area of 357,000 square kilometers and has 81.8 million inhabitants (2011), making it the second most populous state in Europe (after Russia) and the most populous member state of the European Union. The capital is Berlin.

Germany is a parliamentary democracy. The legislature consists of two chambers, the *Bundestag* and the *Bundesrat*. Members of the Bundestag are chosen every 4 years in general elections. The Bundesrat is made up of members of the 16 German states. The members of the Bundestag elect the head of government (chancellor). The head of state is the German president (*Bundespräsident*). In peacetime, the secretary of defense is the head of the armed forces (*Bundeswehr*). In time of war, the chancellor assumes that position (Art. 115a of the constitution).

With a gross domestic product of 2.6 trillion euros (2011), Germany has Europe's largest economy and is one of the world's leading exporters of manufactured goods. The German defense budget for 2012 was 31.7 billion euros. Germany has been a member of the North Atlantic Treaty Organization (NATO) since 1955, of the European Union since its inception in 1958, and of the United Nations since 1973.

This entry discusses Germany's history since World War II, with a focus on its security policy and military.

Historical Development: The German Security Policy During the Cold War

After the end of the Second World War, the victorious Allies failed to agree on a joint policy toward the defeated German Reich. In May 1949, the

American, British, and French zones of occupation became the Federal Republic of Germany (FRG, West Germany), a democratic state with a free market economy. The Soviet zone became the German Democratic Republic (GDR, East Germany), a socialist state.

During the Cold War, Germany was at the center of the East-West confrontation. The Federal Republic sought security through close cooperation with Western democracies, particularly the United States. The Western powers sought West German contributions in the confrontation with the Soviet Union. Immediately after the outbreak of the Korean War, American and West German officials discussed how West Germany could contribute to the common defense of the West. In August 1954, an attempt to create a European Defense Community failed after the French National Assembly voted against the proposal. Instead, the West German Bundeswehr came into being in November 1955 as part of NATO. During the height of the Cold War, the Bundeswehr had roughly 500,000 active soldiers.

The West German constitution (*Grundgesetz*) of 1949, which initially had not made any references to the military, was amended to provide a legal basis for creating the defense forces (Article 87a of the constitution). The amended constitution forbade unilateral West German military actions; the integration of German forces into NATO made any German aggression against its neighbors impossible (*strukturelle Nichtangriffsfähigkeit*).

The Bundeswehr's task during the Cold War was to repel a Soviet attack along NATO's eastern border. While there were nuclear warheads stationed on the territories of East and West Germany during the Cold War years, those weapons were not part of the German military arsenal but belonged to the United States or to the Soviet Union. Most nuclear weapons have been withdrawn from German territory after the end of the Cold War.

The Bundeswehr considered itself from the beginning a military in a democratic society. This referred both to the task of protecting a democratic society from external threats and to its internal structure (*Innere Führung*, leadership development and civic education). The Bundeswehr considers the soldiers "citizens in uniform." Their basic rights are limited during the time of service only to the extent that these restrictions are necessary for the military tasks they perform. Soldiers maintain active and passive voting

rights. The goal of the concept of *Innere Führung* was to make the Bundeswehr part of German society and to avoid mistakes of earlier periods when the military considered itself an elite within society or even became an exclusive “state within the state.” The *Wehrbeauftragte* (ombudsman for the military forces) investigates human rights abuses in the military and reports directly to parliament.

The German Democratic Republic was created in October 1949 and became a member of the Warsaw Treaty organization when it was founded in 1955. The strength of East Germany’s National People’s Army was roughly 170,000 men. The National People’s Army was considered one of the premier armies in the Eastern bloc.

One of the most important aspects of German reunification in 1990 was the security question. The Bonn government and the Western World War II Allies agreed that a unified Germany should not seek security outside the established institutions but as part of NATO. U.S. president George H. W. Bush discussed this question with Soviet secretary general Mikhail Gorbachev at the Malta summit in December 1989. They reached an agreement that Germany should stay a member of the Western defense alliance. The Two-plus-Four treaty of 1990 governing German unification also mandated a reduction in troop levels to 370,000. The East German National People’s Army was dissolved immediately after unification. Roughly 20,000 officers and noncommissioned officers were integrated into the Bundeswehr.

The end of the Cold War and the unification of Germany marked the beginning of new tasks for German security policy and for the Bundeswehr. Germany is now surrounded by friendly neighbors; the task of the Bundeswehr is no longer primarily to provide security for the homeland. Instead, the Bundeswehr took over responsibilities in peace-keeping missions on the Balkans, in Africa, and after 2001 in combating international terrorism. This required a change in the German population’s thinking about the military and modifications in the Bundeswehr’s structure.

New Challenges: Current Security Issues and the Structure of the Bundeswehr

Since the end of the Cold War, the Bundeswehr has undergone numerous changes. The number of active

service members has been reduced from half a million to less than 200,000 personnel.

During the Cold War, the Bundeswehr’s task was the defense of the national borders. In July 1994, at the height of the Balkan civil war, the German Constitutional Court (*Bundesverfassungsgericht*) declared that the term *defense* did not only refer to the protection of the immediate borders but also included crisis reaction and conflict prevention. This allowed the Bundeswehr to take part in UN-led operations outside the territory of NATO member states (“out of area”). The court also mandated *Parlamentsvorbehalt* (parliament approval). The Bundestag has to agree to every military intervention abroad. Since then, the Bundeswehr has participated in a number of out-of-area missions, including the International Security Assistance Force in Afghanistan.

Women have served in the Bundeswehr’s medical service since 1975. In 2000, the European Court of Justice ruled that women had the right to serve in all military functions. There are currently around 18,000 women on active duty.

Traditionally, both the West German Bundeswehr and the East German Volkarmee relied on conscripts. However, on July 1, 2011, conscription to the Bundeswehr was abolished. It is an all-volunteer force now.

GIAP, VO NGUYEN

Vo Nguyen Giap rose to prominence as the most important military figure in 20th-century Vietnam. His career encompassed World War II, the war for National Liberation from the French (1946–1954), and the war for national reunification (1960–1975), dominated by the conflict with the United States from 1965 to 1972. As founder and frequent head of the People's Army of Viet Nam (PAVN), Giap's leadership skills and strategic thinking led to military victories that, though costly, in the end brought Vietnam independence and reunification. His later literary works highlighted the importance of the military as an instrument of the Indochinese Communist Party (ICP, later the Vietnamese Communist Party) and as a powerful force behind "the revolution." This entry discusses Vo Nguyen Giap's rise to power and the struggle for Vietnamese independence.

Early Years: A Nationalist Identity

Giap was born in 1911 (Giap's birth year remains disputed and it is also listed as 1910 and 1912) in central Vietnam, then French Indochina, and being from a respected family, he attended one of the most progressive schools in Vietnam, the Quoc Huc school in Hue. As a teenager, he joined an underground Nationalist group and became one of a growing number of students to protest French colonial policies, even serving time in prison for anti-government activities in 1930. On his release, he continued his studies in history and law, worked as a journalist, and taught at a private school in Saigon. But it was as a Marxist and Vietnamese nationalist that Giap found his true calling. Joining the ICP in the 1930s, he was among the first generation of Vietnamese communists who found themselves caught squarely in the jaws of history when, in 1940, the Japanese invaded French Indochina. With the Japanese move into northern Vietnam, and eventually into all of French Indochina, the Vietnamese became, as Ho Chi Minh stated, "the slaves of slaves," as the heavy burden of French colonialism was increased by the demands of Japanese overlordship. Fearing arrest for his nationalist activities, Giap left French Indochina for China where he met up with Ho Chi Minh and other members of the ICP and helped found the Vietminh—the League for the

Independence of Vietnam—which would be Giap's political home in one incarnation or another for the rest of his career. For the Vietminh, nationalism and the "people's war" were openly identified as the means to drive the Japanese out of the country, end French imperialism in Vietnam, and finally achieve national independence. An ardent nationalist since his teens, Giap was an acknowledged proponent of Vietnamese independence, but it was with the people's war that he would make his name.

People's War

"People's war," Giap wrote, was "to educate, mobilize, organize and arm the whole people" (1961, p. 29) to participate in a combined political and military struggle (known in Vietnamese as *dau tranh*) needed for victory. Although Giap was always politically active, it was with the military aspect of *dau tranh*, or people's war, that he became widely known. Military *dau tranh* was based on the three-stage Maoist model of revolutionary warfare, which in Stage 1 called for the establishment of a popular base. The Vietminh base area was located in the mountainous areas of northern Vietnam; from there, members recruited, trained, and spread their political message among the rural population. With Stage 1 more or less accomplished, Giap's Armed Propaganda Detachments, formed in December 1944, moved into Stage 2 and utilized the surrounding countryside and a sympathetic populace to engage in low-level guerrilla activities against the Japanese.

After the Japanese coup de main against the French colonial government in March 1945, Giap's detachments began training with American soldiers of the Office of Strategic Services as part of the American effort to gain intelligence on Japanese activities in Vietnam and recruit Vietnamese agents to harass their common enemy. As it turned out, military *dau tranh* meshed well with the needs of the Office of Strategic Services, and most members of the American group formed very favorable impressions of Giap and other Vietminh with whom they worked. In April, the Armed Propaganda Detachments were absorbed into Giap's new People's Liberation Army, which would eventually become the People's Army of Viet Nam.

Although the People's Liberation Army saw very limited action, it was extremely well placed to

capitalize on the political vacuum caused by Japan's rapid surrender in August 1945. Giap and his forces left their northern bases and marched southeast to Hanoi to join in the "liberation" of that famous city from Japanese control. As relative peace and stability were reestablished, Giap paraded his best forces before the citizens of Hanoi and the American Office of Strategic Services delegation sent to oversee the Japanese surrender. In the newly established Provisional Government, Giap's duties expanded as he assumed a key post as minister of the interior. In later years, he would be North Vietnam's defense minister and commander in chief of the People's Liberation Army.

Unfortunately for Vietnam, the new peace of 1945 was not to last. The refusal of the French to accept Vietnam's independence led to a war that would continue for the next 8 years (1946–1954). During this time, Vo Nguyen Giap further honed the military skills for which he was already well known within the ICP. His advantageous use of the terrain and populace, including appeals to the people to aid the war effort in the name of the nation, combined with an emphasis on timing, planning, and carefully utilizing often meager resources, prevailed in the end against larger and wealthier enemies. Also key to Giap's successes was his ability to analyze the strategic situation, predict his enemy's moves, and plan his own accordingly. As he became the master of warfare in Vietnam, Giap concluded that maintaining well-established base areas, training troops, honing the popular revolutionary message (Stage 1), and continuing low-level guerrilla actions (Stage 2) alone could not win the war against the French. To accomplish the goals of military *dau tranh*, he contended that the Vietminh needed at least a few large, well-equipped regular units capable of engaging in both conventional and unconventional warfare, which constituted the third and final stage of Maoist revolutionary warfare.

Although Giap's new divisions did well against the French along the Chinese border in 1950, his regular forces were mauled by French forces at both Vinh Yen and along the Day River in 1951. As allowed for in a people's war, Giap took full advantage of the fluidity among stages and withdrew to his northern bases to rebuild, train, and plan. While the Vietnamese forces enjoyed some success in the final months of 1951, it was Giap's stunning success at Dien Bien Phu in 1954 that solidified his military

prowess. In that valley, which Bernard Fall called "hell in a very small place," Giap capitalized on the French failure to understand the flexibility of military *dau tranh* and the power of their political mobilization (political *dau tranh*), which made incredible sacrifices possible with a people's war. He mobilized both guerrilla and regular units to cut off French supply routes, built up artillery emplacements on what the French had assumed was impassable mountain terrain, assembled combat troops that outnumbered the French 5 to 1, and devastated French morale in what became an overwhelming battle of attrition. The victory coincided perfectly with the French-Vietnamese negotiations at Geneva, leading to an armistice that once again brought Vietnam a brief peace.

The 1954 agreement at Geneva, however, led to the creation of two nations. In the north, Giap, the minister of defense in the newly inaugurated Democratic Republic of Vietnam, would soon lead North Vietnamese forces in another prolonged war. What had become the hallmarks of Giap's style of warfare to achieve independence would be used again in an effort to reunify the country by defeating the anticommunist government of South Vietnam and its American ally.

Between 1965 and 1972, the United States and South Vietnam fought South Vietnamese communist guerrillas, guerrilla operatives from the Democratic Republic of Vietnam, and, later, People's Army of Viet Nam regulars. Giap's name became famous in the United States in conjunction with people's war in the South, the strategic success of the Tet Offensive in 1968, the diversionary siege of Khe Sanh in the months leading up to Tet, and a protracted war of attrition that sapped American public support for the war much as French public support had been depleted in the 1950s. Giap's use of people's war, based on the principles of building a solid base of popular support committed to an ideal, whether for overthrowing the colonial regime or for kicking out the foreign support of an unpopular government, would prove decisive in this conflict as well. Giap's ability to recruit and train from among a popular base and then engage the enemy on his own terms, and demonstrate clearly in engagements large and small the ability and will to fight for as long as necessary, made him a role model for other insurgents, especially in Asia. Although no subsequent revolutionaries managed to achieve Giap's levels of

success, his legend looms large. Vo Nguyen Giap is perhaps more famous in the Western world than Mao Zedong, the developer of Maoist strategy, for it is Vo Nguyen Giap who is the embodiment of victorious *dau tranh*, Vietnamese people's war, over large and powerful Western enemies.

Giap authored both books and articles addressing the art of people's war and revolution, as well as memoirs focusing on the victory at Dien Bien Phu, the Vietnamese Communist path to victory, and the war against the United States. Among the most famous are *People's War*, *People's Army*, and *Unforgettable Days*.

GLOBAL POSITIONING SYSTEM

The NAVSTAR Global Positioning System (GPS) is a one-way, space-based radio source for the world's most accurate time and location information. GPS employs an artificial constellation of at least 24 earth-orbiting satellites. With four satellites in view, it is possible to know continuously one's altitude, latitude, and longitude to within a few meters and the time of day exact to within a few nanoseconds. This entry discusses the development of GPS and its users.

GPS has become the U.S. military's foremost, indispensable asset for fighting wars. Planning for the system began in 1973, and its public debut came during the Persian Gulf War. Since then, troops from all the military services have come to rely on GPS precision to synchronize operations, provide fundamental navigation information, pinpoint hostile targets, and locate each other.

Like the integrated circuit, the Internet, and other technologies with strong military connections, GPS time and location are responsible for major transformations in civilian life. GPS signals are now available continuously, globally, and at no charge to just about everyone with a receiver, with civilian users far outnumbering military users. Innovations combining GPS coordinates with portable computing power, communications, and map data have led to an explosion of new civilian applications—from time-stamping financial transactions to managing vehicle fleets to location-based advertising on cell phones. The system's federal overseers characterize GPS as a technological success story and deem GPS an indispensable but vulnerable utility.

Components

The GPS consists of components in space and on the ground. Unmanned launch vehicles deliver the satellites into space, into circular orbits 18,000 kilometers (11,000 miles) above the earth, and the satellites orbit once every 12 hours. From the constellation, accurate time and position information, derived from atomic clocks on board and from data sent from the ground, are transmitted to receivers on earth. A network of ground stations tracks the satellites, monitors their health and orbits, and sends information to them to ensure that the data the satellites transmit are accurate. User equipment can range from a sophisticated system in a military aircraft to an inexpensive receiver in a rental car or a handheld receiver carried by a hiker.

How It Works

Each GPS satellite transmits signals to indicate its location in current time. All the satellites are synchronized to transmit at the same instant. The signals, moving at the speed of light, arrive at a receiver at slightly different times because each satellite is at a different distance. The GPS receiver calculates the distance to each satellite by comparing the arrival times of each signal.

GPS depends on precise atomic frequency standards (also known as “atomic clocks”) and distributes Coordinated Universal Time, an international time scale closely synchronized with international civilian scientific bodies and shared with civilian users. The atomic clocks in the GPS system are so accurate that they can take into account Albert

Einstein's understanding of time, space, and relativity. Because GPS satellites experience less gravity and move at high velocity, their clocks appear to operate at a different rate than those on earth. Since all the clocks in the system must be synchronized, a net correction of 38 millionths of a second per day must be added to the satellite clocks' time signals. Without this tiny correction, the system could not work properly.

History

Research for a satellite-based radionavigation system began in the wake of the satellite *Sputnik* in 1957. In the years that followed, competing satellite navigation systems emerged in the Department of Defense—most notably Transit at Johns Hopkins University Applied Physics Laboratory, Timation at the U.S. Naval Research Laboratory, and Project 621B at the Aerospace Corporation for the U.S. Air Force. GPS formally began in 1973 when the Department of Defense consolidated the efforts and established the Joint Program Office under the U.S. Air Force to procure, run, and maintain the system.

GPS required the development, testing, and refinement of receivers, space-qualified atomic clocks, and other components. As designs evolved, positioning and navigation accuracy improved. Rockwell International (now a division of Boeing) was the prime contractor for building the first 40 GPS satellites, the first of which launched in 1978. By 1986, 18 satellites were in orbit, making the system usable for many applications. The full constellation of 24 satellites needed for global coverage was in orbit by early 1995. More than 30 satellites were operational after 2010.

In the opening salvos of the Persian Gulf War, the first U.S. GPS-guided weapons were delivered against eight targets in Iraq in 1991. This and subsequent conflicts in the former Yugoslavia, Iraq, and Afghanistan have demonstrated the effectiveness of the system for U.S. and allied military purposes. GPS now forms the core navigation system for U.S. military aircraft, vessels, vehicles, and personnel. It has changed the nature of weapons targeting, search and rescue, supply delivery on the battlefield, and command and control. Autonomous vehicles dependent on GPS for navigation have become increasingly important as well. Dependence on GPS is now so great that military planners are strengthening

present system vulnerabilities and developing whole new alternatives. Providing aid for forces in the air and on the ground, GPS has contributed to the use of space as a platform for war.

Civilian use of GPS grew haltingly. GPS military planners in the 1970s had foreseen eventual civilian use of the satellite signals, but at less than full accuracy. They incorporated a design feature, termed *selective availability*, that deliberately introduced timing errors into civilian transmissions. This was also intended to thwart enemy access to the higher precision military signal. Manufacturers of large GPS receivers for military users—Texas Instruments, Rockwell Collins, Magnavox, and Interstate Electronic—were the first to offer them to civilians, especially scientists and surveyors interested in precise geodetic data. The Magellan Systems Corporation marketed the first commercial handheld GPS receiver in 1989; other firms soon followed with devices aimed at hikers, boaters, and other recreational users. GPS burst into public awareness during the Persian Gulf War in 1990 and 1991. In the trackless desert, troops used GPS so extensively that there were too few military receivers. To satisfy demand, the Department of Defense acquired civilian units and temporarily suspended selective availability to allow everyone access to the more precise military signals. Eliminating selective availability in 2000 helped boost the civilian market for GPS. An explosion of applications ensued.

There are still two levels of service from GPS: (1) the Precise Positioning Service for U.S. and allied military users that is encrypted and jam resistant and (2) the Standard Positioning Service that is for civilian users.

Having access to crucial time and positioning information has long been an important goal for nations with ambitions for worldwide influence. Other nations began developing their own satellite navigation systems as alternatives to the U.S. military-controlled GPS. During the Cold War, the Soviet Union developed GLONASS (Global Orbiting Navigation Satellite System), which Russia continues to operate. After 2000, a consortium of European nations developed Galileo. Initially intended as a commercial service, it has changed to a free service similar to GPS. China and India have independent systems of their own in development, and Japan is launching satellites designed to enhance GPS. The extent to which the operators of

these systems will compete or collaborate as global navigation satellite systems proliferate remains an unanswered question.

GLOBAL WAR ON TERRORISM

The September 11, 2001, attacks on the United States focused the country and its leadership on the nature of terrorism and its real threat to American interests. The very label “Global War on Terrorism” became an embedded element of U.S. policy and the common lexicon for years. Subsequent large-scale terrorism against Spain, the United Kingdom, India, and a host of other nations reinforced a common understanding of the threat over the next decade. This entry discusses global terrorism from the Cold War era to the present, including the September 11, 2001, attacks, with a focus on U.S. policy.

Often lost in the immediate aftermath of September 11, 2001, is the lengthy history of terrorism in the modern age, particularly after World War II. Although relatively rare in the Soviet Union and many Western nations during the Cold War,

terrorist violence flourished in what was known as the Third World. Scholars have focused on the various cultural, economic, and political origins of this violence. Many revisited similar sources after the collapse of the Soviet Union and the breakdown of order in the many failed states inhabiting the post-Cold War globe.

Despite their distance from upheaval, Europe and America were not untouched by terrorism in the past 40 years. By the early 1970s, the cushion separating affluent, industrialized nations from deliberate acts of violence began to dissipate. The resurgence of the “Troubles” in Ireland, the hostage crisis at the 1972 Munich Olympics, and an increasing drumbeat of assassinations, airline hijackings, and kidnappings quickly brought home the realization that no part of the world was truly safe.

Terrorism in the Modern Era

After 1945, terrorism became an unfortunate by-product of the Cold War. Without recourse to conventional methods of power, unconventional violence became standard operating procedure for the United States, the Soviet Union, and their respective proxies. Car bombings, assassinations, as well as terror attacks against civilian and military targets were all common devices. Reliable studies of U.S. activity in Iran, Guatemala, and Cuba describe an array of methods utilized to intimidate and terrorize both real and perceived threats to American security.

By the 1970s, the growth of international terrorism accelerated even beyond Cold War standards. The attack on Israeli athletes at the Munich summer Olympics captivated and horrified a global audience. Similarly, when a civilian airliner was hijacked and diverted to Entebbe, Uganda, in 1976, the world again held its breath and celebrated when a daring Israeli mission succeeded in rescuing the hostages. Overall, terrorist incidents rose alarmingly between 1968 and 1982. Attacks focused on individuals and facilities in western Europe, the Middle East, and Latin America.

American policy during this period largely treated terrorism as a crime subject to civilian authority. At home, the Federal Bureau of Investigation and Federal Aviation Administration assumed primary responsibility for policy. Abroad, the State Department was the lead agency. By the time Gerald Ford became president, American officials increased

airport security measures in major terminals throughout the country. Precautions included an embryonic electronic system created to check passenger luggage as well as tighter visa, immigration, and customs procedures.

From 1979 onward, the Iranian Revolution and the subsequent hostage crisis defined America's particular approach to terrorism. The Carter administration's initial responses to the crisis were consistent with established precedent. With the State Department taking charge, the United States attempted a regimen of diplomatic initiatives and, when these failed, a series of economic sanctions designed to successfully resolve the standoff with Tehran. The 1980 military rescue mission was invoked only as a last resort and with great reluctance. The schism it caused with Carter's cabinet, which led to the eventual resignation of Secretary of State Cyrus Vance, represented the depths of disagreement over a military response to the hostage crisis.

Apart from the Iran situation, Carter's term ended on a bleak note regarding global terrorism. A 1979 report by the Central Intelligence Agency's National Foreign Assessment Center marked that year as the worst in terms of casualties since the agency began keeping records in 1968. In sum, what the Tehran hostage crisis represented was a mere glimmer of the future, one in which American policy and capabilities were wholly inadequate to the task of addressing terrorism.

Ronald Reagan became president in part because of the Iran hostage crisis. It allowed him to portray Carter as a weak, vacillating leader and provided the former California governor with a chance to make a clean break with what the public perceived as failed policy. Once in office, Reagan was true to his campaign rhetoric. After 1981, official U.S. policy framed terrorism under the category of "low-intensity conflict," placing it in the same category as insurgency and illegal drug trafficking. While it did not pose a direct threat to the United States by definition, the administration saw the primary danger of terrorism in the potential "cumulative nature" of problems it could cause, specifically the isolation it might create between America and its political allies and major trading partners.

From the White House's perspective, terrorism was a component of the larger Cold War conflict with the Soviet Union. Consequently, when it identified the sources of terrorism, the administration

focused specifically on state-sponsored terrorism and concentrated its efforts on host governments known to be supporting terrorist groups. American policy responses thus applied to the Soviet Union, which policymakers believed was using terrorists as Cold War proxies. They also applied to other nations, such as Libya, a country that openly sponsored terrorist attacks against the West.

Throughout the 1980s, a multiplying series of attacks against the United States and its citizens placed terrorism in the forefront of American policy. The bombing of the U.S. Marine barracks in Beirut in October 1983, killing 241 service members, sent a shockwave through the country. Smaller scale terrorist attacks continued against U.S. military personnel stationed overseas in West Germany and West Berlin. The brief period between June 1985 and December 1988 witnessed the hijacking of TWA Flight 847 to Beirut, terrorist assaults on airports in Rome and Vienna, the capture of the passenger liner *Achille Lauro* as it cruised the Mediterranean, and the midair explosion that destroyed Pan Am Flight 103 over Lockerbie, Scotland. Leon Klinghofer, a disabled passenger murdered by terrorists on the *Achille Lauro*, and Robert Stethem, a U.S. Navy diver tortured and killed during the Flight 847 standoff, came to represent the increasing furor over terrorism.

As the frequency of attacks grew, the American public became increasingly critical of policy considered too lenient toward terrorist groups. Congressional pressure to enhance U.S. counter-terrorist capability grew in concert with this discontent. In 1984, Senator Arlen Specter (R-PA) proposed changes to U.S. policy that would permit the "forcible apprehension" of terrorists. Public officials also ratcheted up U.S. rhetoric regarding terrorism and stronger countermeasures. Secretary of State George Shultz endorsed the idea of an "active defense" against the threat and called for a "preemptive capacity" to "deter terrorism by way of raising the price or 'ante' of terrorism activities" (Memorandum for the Vice President from C. Boyden Gray, 1985, p. 1).

The search for a more aggressive methodology inevitably led policymakers to the U.S. armed forces. In January 1984, the U.S. Navy authorized OP-06D, the "Red Cell" unit whose mission was to identify security vulnerabilities on American ships and installations. The Red Cell was the institutional

counterpoint to SEAL Team Six, which served as the navy's primary antiterrorist unit after 1981. The U.S. Army eventually developed Delta Group in 1977, which served as that service's equivalent of a SEAL Team. All of these actions were unified when Congress created the Special Operations Command in 1986, mandating that American special forces were responsible for the "immediate and primary capability to respond to terrorism" (Bruner, Bolkcom, & O'Rourke, 2001, p. 1).

Despite the improvements in military counterterrorism capability, American officials were reluctant to commit forces to this new mission. When the National Security Council discussed potential responses to five Americans taken hostage in Lebanon in 1985, the military option was restricted to retaliation by naval air power. At no point did senior officials seriously consider a hostage rescue mission utilizing Delta or SEAL Team Six.

The post-Cold War environment of the 1990s served as a new context for terrorism. In terms of the sheer number of terrorist attacks, the 1990s were a dangerous time. According to the Central Intelligence Agency, by 1997, American citizens and facilities worldwide made up 40% of terrorist targets, up from 25% the preceding year. The period was punctuated by a series of devastating attacks against American targets abroad, as was the case when 19 American military personnel died during the 1996 Khobar Towers bombing in Saudi Arabia. Nor was the home front immune. The first attempt to destroy the World Trade Center in 1993 shocked the country. Perhaps more disturbing was the Oklahoma City bombing in 1995, which revealed the real threat of right-wing fanaticism from within the United States itself. In the wake of nearly 1,000 dead and injured, Timothy McVeigh became the new face of domestic terrorism.

The Clinton administration's approach to this threat was mirrored by its predecessors. For the most part, the president and his national security team treated terrorism as a diplomatic and legal problem, a standard expressed in the June 1995 Presidential Decision Directive 39 *U.S. Policy on Counterterrorism*. The document made it clear that America would "deter and preempt, apprehend and prosecute, or assist other governments to prosecute, individuals who perpetrate or plan to perpetrate such attacks" (p. 1). The lead agency for policy was again the State Department. One of its first actions

was sponsoring the "Summit of Peacemakers" at Sharm al-Sheikh in 1996, which produced a pledge from 29 countries to commit greater resources to fight terrorism.

This approach produced what could be best described as mixed results. When the Federal Bureau of Investigation attempted to investigate the Khobar Towers bombing, local authorities refused to grant it equal jurisdiction, seriously impeding any progress. However, in some instances, American officials were able to win cooperation overseas. Between 1993 and 1998, 10 suspected terrorists were extradited back to the United States for trial.

The 1998 African embassy bombings were a clear turning point for U.S. counterterrorism policy. The massive explosions, which struck the American embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania, on August 7, 1998, killed 224 people (12 U.S. citizens) and wounded nearly 4,500. The Islamic Army for the Liberation of Holy Sites, a group led by Saudi millionaire Osama bin Laden, claimed credit for the attacks. In response, President Bill Clinton quickly signed an executive order freezing assets owned by bin Laden. The Federal Bureau of Investigation launched a massive investigation of the two attacks. More than 900 special agents were deployed overseas, the largest operation of that type in bureau history. By the end of 1998, 11 indictments were handed down in federal court and four suspected terrorists were taken into custody.

After the 1998 embassy attacks, the administration launched a series of military operations against known and suspected terrorist facilities in Afghanistan and a "pharmaceutical" plant in Sudan. The attacks were made against terrorist organizations rather than specific individuals. Moreover, they were intended not only to be retaliatory for the embassy bombing but also preemptive to the extent that they would disrupt terrorist activity, at least over the short term.

The September 11 Attacks and Afterward

The first months of George W. Bush's presidency were replete with warnings of an impending terrorist attack. As declassified documents later proved, clear danger signs were present throughout his first months in office. However, the same claims regarding a serious threat to American security also appeared as early as June 2000 in a report by

the bipartisan National Commission on Terrorism. It was a remarkably candid document, which suggested that the United States was drifting away from combating state-supported terrorism. The report's authors believed that U.S. policy was generally too passive and overly focused on defeating the bin Laden network. Among its recommended reforms were removing existing limitations on the recruitment of Central Intelligence Agency counterterrorism informants and, importantly, that the Defense Department become the lead agency in the event of a "catastrophic attack on U.S. soil."

The September 11, 2001, attacks permanently removed the issue from the realm of speculation. For its own part, the Bush administration depicted the immediate post-9/11 period as a sea change in the American understanding of war and national security. Vice President Dick Cheney asserted this point of view in 2003:

The strategy of deterrence, which served us so well during the decades of the Cold War, will no longer do. Our terrorist enemy has no country to defend, no assets to destroy in order to discourage an attack. Strategies of containment will not assure our security either. There is no containing terrorists who will commit suicide for the purposes of mass slaughter. (p. 2)

However, as much as the administration portrayed the situation in 2001 as a clear point of demarcation, it was, in reality, the culmination of a generational war against terrorism. In this context, the attacks on New York and the Pentagon were part of the inheritance of Munich, Entebbe, the *Achille Lauro*, the USS *Cole*, and the embassy bombings in Africa.

When it was finally published by the National Security Council in 2002, *The National Security Strategy of the United States of America* established a new template for the Global War on Terrorism:

It has taken almost a decade for us to comprehend the true nature of this threat. Given the goals of rogue states and terrorists, the United States can no longer solely rely on a reactive posture as we have in the past. The inability to deter a potential attacker, the immediacy of today's threats, and the magnitude of potential harm that could be caused by our adversaries' choice of weapons, do not permit that option. We cannot let our enemies strike first. (p. 15)

Although the document indicated the importance of freedom, "human dignity," and regional alliances—allowing for a degree of continuity with Clinton—its core goal was the ultimate destruction of terrorism by military means. This basic standard defined American wars abroad for the remainder of the decade.

Military action proceeded before the new policy had an opportunity for much scrutiny. The respective invasions of Afghanistan and Iraq were, in part, justified as strikes against anti-American terrorist networks. Early operations seemed to indicate success. Once Operation Enduring Freedom unfolded in 2001, it appeared that a very small contingent of Americans, supplemented by precise tactical bombing and indigenous allies, had redefined the art of war. Many civilian leaders, most importantly Secretary of Defense Donald Rumsfeld, preached that the "revolution in military affairs" had finally arrived. Subsequent operations in Iraq, Afghanistan, Libya, and other locations have proven this assumption to be problematic at best.

Despite these significant difficulties, America's commitment to the Global War on Terrorism grew in the decade following the September 11 attacks. In Central Asia, the Pentagon solidified ties with numerous former Soviet republics by dispatching military advisory missions to them. Assistance included foreign military financing, training under IMET (International Military Education and Training), and nonproliferation, antiterrorism, and demining programs. One of the most important battlefields in the Global War on Terrorism was the Philippines. American special operations forces deployed as military trainers in November 2001 and remained in what U.S. officials called the "second front" in the Global War on Terrorism.

After September 11, 2001, American policy also focused on terrorism in Africa. Conditions within many parts of the continent—highlighted by widespread poverty, disease, and instability—made it almost an ideal ground for recruitment, even more so given the fact that 50% of the population is below the age of 15. In September 2005, the State Department named the Africa-based Salafist "Group for Call and Combat" a terrorist threat on a par with al Qaeda. In actual practice, African terrorism has extended far beyond the region. According to official U.S. estimates in 2006, as many as one quarter of the foreign fighters in Iraq

(5,000–8,000) were African. To address this challenge, the United States created a major military command (Africa Command) to eventually serve as a vehicle for military policy in the region. However, the initiative ran into widespread trouble when Nigeria, South Africa, Algeria, and Libya immediately opposed the measure, claiming that it had been made to counter growing Chinese influence in the hemisphere.

Conclusions

In some important respects, the current American Global War on Terrorism has been a victim of its own success. More than 10 years of operations have yielded a number of important victories. The American military and its allies around the world have successfully disrupted terrorist organizations and their sanctuaries. Neither countries (Afghanistan) nor particular regions (Mindanao, southern Somalia) offer terrorists the safety they once enjoyed before September 11, 2001.

But victory is incomplete and has resulted in a threat that is now more diffuse and difficult to combat. American military operations successfully disrupted al Qaeda and other groups to the point where they are no longer easily identifiable. A small-scale war against terrorism has thus become smaller. An increasingly decentralized enemy now finds sanctuary in great expanses of difficult geography—as is the case along the Afghanistan-Pakistan border and rural Indonesia—or within the crowded urban sprawl of the underdeveloped world.

The terrorist enemy has also proven to be adaptable. After the initial phase of “shock and awe,” terrorists are proving extremely resilient in the face of American efforts. Terrorist networks that survived the onslaught of 2001–2003 have adapted revised tactics to new locations to protect their viability. Ironically, many reappeared in the very Western nations that the Global War on Terrorism was originally supposed to protect. The increased incidents of militant Islamism in Europe, specifically in England, Spain, and Denmark, indicate a deliberate plan to attack vulnerable populations while enjoying a legal shield from direct military action or covert operations.

As the war against terror progresses, it also reveals the limits of direct military action. Over

the long term, the term *global war against terrorism* has proven to be a misnomer. In actual practice, this type of war obliges the United States to address the underlying causes of terrorism rather than simply its command structure or order of battle. Actual operations demand a patient approach focused on ideology, propaganda, and recruitment patterns, factors that have as much to do with socioeconomic and cultural challenges as military ones. Since 2001, the U.S. military has incorporated social science (e.g., “human terrain mapping”) into its arsenal of responses to terrorism. Counterterrorism has become a highly sophisticated form of counterinsurgency.

It is impossible to predict the future success of the Global War on Terrorism. It depends on a complex and fragile combination of factors, the least of which are the high degree of training necessary for military forces, the complex balance of civilian and military resources, and domestic political fortitude. Early indicators of the U.S. withdrawal from Iraq and the 2009 “surge” in Afghanistan are subject to much scrutiny and debate. It is likely that it will take many additional years to assess the true nature of success or failure in these key countries and other areas affected by the war.

GOLDWATER-NICHOLS DEPARTMENT OF DEFENSE REORGANIZATION ACT

Enacted after more than 4 years of intense debate, the Goldwater-Nichols Department of Defense Reorganization Act of 1986—named for its sponsors, Senator Barry Goldwater (R-AZ) and Representative Bill Nichols (D-AL)—was intended to reorganize America's armed forces to improve their interservice capabilities and eliminate inefficiencies, unify U.S. warfighting capabilities as a member of the allied and coalition forces, and harmonize Department of Defense (DOD) weapons and equipment acquisition and budgetary processes. This entry first examines the historical background out of which this legislation emerged and describes the seven main areas addressed by the act. It then discusses its most noteworthy provisions and their impact.

Background

To address perceived defects of World War II's bifurcated command structure (one for the U.S. Army and the Army Air Forces, the other for the U.S. Navy

and Marine Corps), Congress passed the National Security Act of 1947. This law placed the armed forces under a civilian secretary of defense. The chiefs of staff of the army and newly independent air force, the chief of naval operations, and the commandant of the Marine Corps comprised the Joint Chiefs of Staff (JCS), which elected a chairman who reported to the secretary of defense. Both the chairman of the Joint Chiefs and the secretary of defense report to the president, who holds the constitutional position of commander in chief of all U.S. armed forces and is the head of the National Command Authority for nuclear weapons control. The 1947 act required the JCS to provide for the unified strategic direction of the armed forces, for their operation under unified command, and for an integrated and efficient team of land, naval, and air forces.

Despite the 1947 restructuring, continuing disconnects created budgetary, training, and command-and-control issues and tactical and operational shortcomings. These included incidents during the Korean and Vietnam Wars, the retaking off Cambodia of the seized merchant vessel *Mayaguez* in 1974, and the abortive "Desert One" 1980 Iranian hostage rescue attempt. The lack of radio interoperability between army, marine, and air force units engaged on Grenada in 1983's Operation Urgent Fury (and fratricidal, aka friendly fire, incidents) was cited as an egregious example of the existing system's deficiencies. The impact of the AirLand Battle doctrine in the 1980s—focusing on "deep battle" and coordination of training, weapons, and systems required to achieve an in-depth defeat of Warsaw Pact forces in the event of a Central European war—underscored the need for greater unity of command among the services.

The Goldwater-Nichols Act's overarching emphasis was on restructuring the armed services to meet the demands of joint operations. While several senior military leaders supported the legislation, several members of the Joint Chiefs objected at the time. Their criticisms included whether the specialized attributes of the individual branches would be too subsumed into "jointness"; whether the armed services would lose budgetary and procurement power for service-specific needs; whether the emphasis on joint command would create additional bureaucracies and promote, not lessen, inefficiency; and whether shortcomings attributed by the act's sponsors to the armed services were more

properly due to a host of political issues. Over these objections, the legislation was enacted by President Ronald Reagan in 1986.

The Act's Essential Features

Congressional intent in enacting the act focused on seven broad areas:

1. To reorganize the DOD and strengthen civilian authority in the DOD
2. To improve military advice to the president, the National Security Council, and the secretary of defense and specified combatant commands (COCOMs) for the accomplishment of missions assigned to those commands
3. To ensure that the authority of the unified and specified commanders is fully commensurate with the responsibility of those commanders for the accomplishment of those missions assigned to their commands
4. To increase attention in the formulation of strategy and contingency planning.
5. To provide for the most efficient use of defense resources
6. To improve joint officer management policies
7. To enhance the effectiveness of military operations and improve the DOD's management and administration

Of these, the resulting changes were perhaps most noteworthy in four areas. The Goldwater-Nichols Act enhanced the role of the chairman of the JCS and lessened that of the individual services' chiefs and departments, expanded the roles of unified COCOMs that control U.S. forces both domestically and overseas, created a joint officer specialization for Joint Staff and JCS duties, and greatly affected appropriations, procurement, logistics, and other systems.

Enhanced Role of the JCS Chairman

Under the act, the chairman is "the principal military adviser" to the president, National Security Council, and secretary of defense. The act also established the position of vice chairman of the JCS. The chairman serves at the president's pleasure for a 2-year term and may be reappointed for up to two additional terms, and the position is rotated among the armed services. The chairman holds a four-star rank and outranks all other officers of the armed forces;

however, the chairman may not exercise military command over the JCS or any of the armed forces. To ensure that the service chiefs still retain significant voices in JCS decisions, any JCS member may submit to the chairman advice or an opinion in disagreement with or in addition to the chairman's advice being presented to the president, National Security Council, or secretary of defense; the act requires the chairman to present those views "at the same time he presents his own advice" to the civilian leadership.

Interservice Command Organization

Since Goldwater-Nichols, the individual military services and their respective chiefs no longer have primary operational control over warfighting. Instead, they are directed to organize, train, modernize, and equip forces for use by the COCOMs. The COCOMs are organized either functionally (e.g., Transportation Command) or geographically (e.g., European, Southern, Central). The COCOM's commanders—once called "commanders in chief" but since 2002 referred to as combatant commanders—exercise unified command and are empowered to use each branch of the military to achieve the COCOMs designated missions. Each combatant commander reports to the secretary of defense through the chairman of the JCS and, through the secretary, to the president. Hence, although the act increased the chairman's abilities, it also provides a greater measure of command authority to COCOM-level combatant commanders.

The role and prominence of special operations have been a long-standing area of debate among the services. The 1980 Desert One incident underscored the need for enhanced joint special operations capabilities, an area often viewed as being given short shrift by traditional military forces. Congress passed the Nunn-Cohen Amendment, creating a COCOM known as U.S. Special Operations Command commanded by a four-star officer and allocated separate funding to ensure that it has adequate, independent resources.

Officer Personnel Management

Goldwater-Nichols significantly affected officer personnel management, traditionally a matter left largely to individual services' discretion. Officers are routinely assigned to Joint Duty positions and must attend joint DOD training as part of their

professional development. This extends to general-level promotions: as a prerequisite for flag officer rank, O-6 level personnel (army, Marine Corps, and air force colonels and navy captains) must complete at least one Joint Duty assignment. Furthermore, the act specifies minimal requirements for officers to serve on the Joint Staff that assists the chairman and the other JCS members in carrying out their responsibilities. The members of the Joint Staff are selected by the chairman in approximately equal numbers from (a) the army, (b) the navy and the Marine Corps, and (c) the air force, and each officer's tour of duty on the Joint Staff is generally limited to 4 years (see Figure 1).

Procurement, Budgeting, Logistics, and the "Revolution in Military Affairs"

With respect to two chronic sources of much interservice friction—appropriations and

procurement—Goldwater-Nichols sought to curb prevailing “green-suit versus blue-suit” tensions by requiring such decisions to be made on a joint (“purple-suit”) basis. Servicewide weaponry initiatives—for example, smart weapons technology, proliferation of laser targeting designators to the small unit level, communications/information technology, and stealth systems—have benefited from the act's consequences. Joint procurement has led to substantial streamlining of procurement, supply, transportation, and budgetary processes.

Because the nature of joint warfighting and modern weapons means that the necessary training and doctrine must also be joint, some military theorists regard the Goldwater-Nichols Act as being the critical initial step required to bring about the so-called Revolution in Military Affairs, with its focus on enhanced, closely integrated C4ISR processes—command, control, communications, computers, intelligence, surveillance, and reconnaissance—and

Figure 1 Post-Goldwater-Nichols Organizational Structure, U.S. Department of Defense

Source: Chad Pelton, adapted from organizational chart originally prepared by ODA&M, Office of the Secretary of Defense, U.S. Department of Defense (January 2005).

substantial reliance on unified information technology systems across the battlespace. It is difficult to see how the Revolution in Military Affairs's emphasis on information technology-driven "team warfare," as in the army's Stryker brigade combat teams, could be fully implemented without Goldwater-Nichols's foundation.

Consequences, Criticisms, and Open Issues

The act's first combat test was Operation Just Cause, the 1989–1990 Panama operation that deposed Manuel Noriega's regime. Compared with Urgent Fury, Just Cause resulted in fewer friendly fire incidents and generally manifested better integration between the services. The Persian Gulf War of 1991 (Desert Shield/Desert Storm) was widely touted as having validated Goldwater-Nichols's goals as to the benefits of unified command and coordination between the U.S. military, as well as in the context of alliance/coalition warfare.

Even the act's reforms were unable to bring about the achievement of American goals in the next two operations—Restore Hope in Somalia (1992–1994) and Uphold Democracy in Haiti (1994–1995). While the Persian Gulf War was a classic AirLand Battle campaign involving essentially symmetric forces, both the Somali and Haitian operations were contingency operations requiring complex politico-military operations coupled with humanitarian missions usually handled by civilian/nongovernmental organizations. The rise of asymmetric warfare in the 21st century, as encountered in Iraq and Afghanistan, may pose challenges to Goldwater-Nichols's unitary model. In general, however, military operations since the act have gradually evolved from more of a deconfliction of roles between the services (as manifested during the Persian Gulf War) to greater interoperability and perhaps a growing interdependence among the branches.

Concerns linger as to whether joint oversight over budgetary and procurement matters hamstringing the individual branches' needs. Commentators posit that joint procurement makes it harder for those systems required for highly specific tasks to survive in an increasingly unified budgetary/acquisition process. Similarly, critics suggest that constant expectations for "jointness" in much operational planning have inevitably resulted in more layers of command and superimposed new bodies of doctrine and requirements over preexisting ones.

Some historians and political scientists have commented that the Goldwater-Nichols Act's enhancement of the role of the chairman has lessened, not strengthened, civilian control over the U.S. military. Despite its strictures that the chairman shall not exercise military command over the services' chiefs, by placing so much power in the hands of one officer, Goldwater-Nichols has essentially provided the chairman with a substantial level of authority and has reduced the number of sources for military decisions officially available to the president as the nation's commander in chief.

GUANTANAMO BAY PRISON

The prison at the U.S. naval station in Guantanamo Bay, Cuba (often abbreviated “Gitmo” or GTMO), is a detention facility for terror suspects, and has been in operation since its establishment by President George W. Bush in 2002. The legality of Guantanamo, particularly its military commissions and interrogation techniques, has been the major source of controversy surrounding the prison since its inception. While the Obama administration made a pledge to close Guantanamo within the president’s first year in office, there has been little change in the operations of the detention center. Guantanamo currently remains open and operational, and has held about 800 detainees since its establishment. This entry examines the history and controversies surrounding the Guantanamo Bay prison.

History

The naval station at Guantanamo, the only U.S. military base in a communist nation, has been under

U.S. control (through an indefinite lease) since the end of the Spanish-American War in 1898. Under the terms of Cuban-American treaty in 1903 (and reaffirmed in 1934), the United States had a right to maintain a naval station at Guantanamo in perpetuity. Although never formally annexed by the United States, the U.S. Navy has exercised full control over this territory. Although Fidel Castro after coming to power in 1959 had demanded that the United States vacate Guantanamo, even cutting off power and water at one point, he never militarily sought to challenge the base. Although primarily a naval base, Guantanamo had, prior to the attacks on September 11, 2001, been used to house Cuban and Haitian refugees in the 1990s. The naval station itself was historically surrounded by both Cuban and U.S. minefields until President Bill Clinton ordered the dismantling of U.S. mines at the station in 1996.

In 2002, President Bush established the detention center for prisoners taken during the War in Afghanistan. The inmates were housed at Camps Delta, Echo, Iguana, and X-Ray (now closed). Because of the complicated nature of U.S. control and Cuban sovereignty, the inmates at Guantanamo were not granted traditional prisoner of war allowances, leading many groups, including the American Civil Liberties Union and the International Red Cross, to protest the operations at Guantanamo.

The Bush administration sought a number of legal opinions on its operations there, especially regarding the “enhanced interrogation techniques” described in a 2003 memo to Deputy Attorney General John Yoo. This report concluded that degrading treatment did not necessarily constitute torture, as long as the pain caused to the prisoner did not constitute pain as severe as organ failure. In *Rasul v. Bush* (2004), the U.S. Supreme Court ruled that prisoners at Guantanamo had standing to bring habeas corpus claims in federal courts. The courts rejected the Bush administration arguments that presidential powers as commander in chief to hold detainees were above judicial review and that federal courts lacked jurisdiction over Guantanamo since it was legally part of Cuban soil. The legality of Guantanamo was further challenged in the U.S. Supreme Court in *Hamdan v. Rumsfeld* (2006). In a complex ruling, the Court declared that the protections of the Geneva Conventions applied to enemy combatants. It also found that the president as commander in chief did not have an inherent right to establish military tribunals but must seek congressional authorization.

In response to *Hamdan*, Congress in late 2006 provided formal authorization of military tribunals to try detainees at Guantanamo under procedures that deviated from those in civilian and military courts under the Uniform Code of Military Justice.

Current Issues

Cases like *Rasul* and *Hamdan* increased public debate over the legality of Guantanamo, and the issue spilled into the 2008 presidential election. As a candidate, Senator Barack Obama publicly committed to closing Guantanamo if elected, and immediately following his inauguration as president in 2009, he signed an executive order that mandated the closure of the prison within 1 calendar year. Shutting down the detention facility has proven to be a much more difficult task than initially anticipated, and while Obama attempted to create a system in which detainees would be tried by the federal court system, congressional action in the 2011 defense spending authorization prohibits the courts from being used to try Guantanamo detainees.

In April 2011, the WikiLeaks organization publicly released hundreds of files related to the detention center, a number of which reveal major flaws in the operations of Guantanamo. The documents show that innocent detainees were sometimes held for several months before their release, while others (including documented al Qaeda members), who may pose real threats to the United States, were sometimes released to foreign nations. In many cases, prisoners were also transferred to Central Intelligence Agency prisons on foreign soil, and the chaos and inefficiency of determining the guilt or innocence of the detainees was highlighted in the documents.

The debate over torture at Guantanamo was revived in the spring of 2011 with President Obama's executive order reinstating military commissions to try detainees. The debate was expanded in May 2011 with the killing of Osama bin Laden in Pakistan, which was aided by information obtained through Central Intelligence Agency's "enhanced interrogation techniques." However, the final word on whether these tactics were responsible for gathering vital information is yet to be determined, as the relevant Central Intelligence Agency documents are still classified.

There are about 166 prisoners remaining in Guantanamo today, and the prisoners fall into three categories: (1) enemy combatants, (2) prisoners with

pending criminal charges, and (3) prisoners not yet cleared for transfer to other countries because of U.S. concerns over their safety in those countries' prisons. Due to the congressional block (the Ike Skelton Defense Authorization Act for 2011) against using the federal court system to try detainees, the Obama administration reinstated military commissions at Guantanamo.

In April 2012, the United States authorized a military tribunal for Khalid Sheikh Mohammed at Guantanamo and four other men suspected of involvement in planning the September 11, 2001, attacks. The White House had initially planned to try Khalid Sheikh Mohammed in a New York City courtroom, but the reinstitution of military commissions caused the trial to be moved. The debate over the military commissions has continued to the present day, and while WikiLeaks increased public attention to the treatment of detainees at Guantanamo, the issue of enhanced interrogation techniques still remains at the forefront of the discussion on Guantanamo.

Conclusion

While Guantanamo remains open and an issue of contention in American policy, President Obama has banned the heavily debated "enhanced interrogation techniques" used during the Bush administration, and the number of prisoners at the detention center has steadily decreased since 2009. The promise to close Guantanamo represented an attempted break with the controversial and internationally unpopular policies of the Bush administration, but the debate over trying detainees by military commissions versus the federal court system will likely continue public debate over the legality of U.S. actions at Guantanamo.

GUERRILLA WARFARE

The term *guerrilla war* originated during the Spanish Peninsular War of 1808–1814. Throughout the 19th and early 20th centuries, it was used synonymously with *small war* and *la petite guerre* to describe a situation in which a great power's conventional army fought against an irregular indigenous armed force. After 1945, this was understood to mean an ethnic or national liberation struggle against a European colonial occupier or, later, the governing regime of a postcolonial "new nation." Either side in a guerrilla struggle could receive support from an external patron, as was the case in Vietnam, where the United States shouldered the primary burden of counterinsurgency operations. Guerrillas rely on rapid movement, ambush tactics, acts of terror, and support from local noncombatants to minimize their weaknesses and exploit the vulnerabilities of their stronger opponents. The outcome of most such struggles has hinged on the question of whose violence was better calibrated to secure and maintain control over the civilian population: the guerrillas attempting to establish a new political and social order or the government fighting to retain its legitimacy and authority.

This entry traces guerrilla warfare from the Napoleonic period through the colonial wars of the 19th century, the partisan struggles of the 1940s, the decolonization conflicts of the 1950s and 1960s, and the Indochinese Wars of 1946–1975. After the al Qaeda attacks of September 11, 2001, and the subsequent campaigns in Afghanistan and Iraq, the U.S. military abandoned the term *guerrilla warfare* for the more expansive concept of *counterinsurgency*, which emphasizes an integrated and

sustained civil-military effort to retain or regain control over populations mobilized by insurgent groups. Although guerrillas frequently employ terror, modern terrorism is a transnational phenomenon in which very small groups mount periodic high-visibility operations in pursuit of large, transformative goals, whereas guerrilla movements and modern insurgencies are protracted efforts attacking sovereign states from within.

American diplomats and soldiers committed two grave analytic errors when they began to confront guerrilla movements in the Third World during the 1960s. The first was an insistence that all liberation struggles were proxy wars in the Cold War confrontation between the United States and the Soviet Union, and not primarily responses to local histories and conditions. The second was an overinvestment in tactics and technologies to destroy the individual guerrilla *fighter*, and not the political initiatives required to neutralize the *organization* sustaining the guerrilla and the *grievances* motivating him to fight. In the most protracted struggles, the length and cost of the conflict eroded the legitimacy of the stronger power, and the guerrillas won. However, during some conflicts, guerrilla forces failed to establish, or later forfeited, broad support among the people, particularly in Latin America.

Historical Overview to 1960

Guerrilla is the diminutive of *guerra*, Spanish for war. However, in English, *guerrilla*, little or small war, came to mean an irregular *soldier*, and by extension the *type* of war he wages, rather than *guerrillero*, the original Spanish term for the individual soldier. The Spanish Peninsular War (1808–1814) marked the point where irregular warfare, as an adjunct to conventional maneuver warfare, first emerged. In Spain, nationalists and antiliberals took up arms to resist a French *diktat* against the Bourbon crown and an initially unopposed occupation of Madrid. *Guerrillero* bands, often led by Catholic priests, sprung up throughout Spain, conducting ambushes and counterambushes of small detachments and couriers, summary execution of prisoners, destruction of supply trains, and assassination of local Spanish liberals and collaborators. These bands provided timely and accurate intelligence to General Arthur Wellesley's Anglo-Portuguese force sheltering

behind, and later attacking out from, the defenses of Lisbon in exchange for materiel support in the common struggle against Napoleon. Recently, Thomas M. Huber developed the concept of “compound warfare” to refine our understanding of this type of conflict, which combines characteristics from both guerrilla and maneuver warfare. In Huber’s analysis, wars frequently occur between opponents of very unequal conventional capacities. To drive the stronger power out of its territory, the weaker opponent must secure the assistance of a third power, and then balance its effort between an internal guerrilla force practicing selective terror against occupying forces and collaborators, and a smaller conventional force-in-being, which must be able to retreat into and emerge from a sanctuary along its borders where its opponent cannot enter. Other compound wars include the American Revolution, 1775–1783; the Chinese Communist resistance to Japan and victory over the Kuomintang, 1937–1949; both Indochina Wars of 1946–1975; and the Russo-Afghan struggle of 1981–1989. In the American Revolution, the patriots’ sanctuary was the vast hinterland, into which the British army was loath to penetrate. The Chinese Communists had Yunnan Province, the Viet Minh the Ap Bac region adjacent to China, and the North Vietnamese their logistical bases in Cambodia and Laos, while the Afghan mujahideen could withdraw to and emerge from Pakistan. In each of these struggles, the guerrilla component was critical to the eventual defeat of the stronger opponent.

Between 1815 and 1914, the professional soldiers of Great Britain and the continental powers would see most of their active service in the pacification struggles that marked the expansion of their respective new empires in Asia and Africa. These “small wars” produced sophisticated discussions of both the operational and tactical arts against “native” or “savage” opponents. The classic compendium in English of the small warrior’s craft was Royal Engineer Colonel Charles E. Callwell’s *Small Wars* (1906, revised 1914). However, absent from all treatises on colonial warfare is any acknowledgment that indigenous forces could command enough political legitimacy to compel *political* negotiations with the colonizing power. For British, French, and Dutch soldiers, the central task was to coerce guerrillas into submission. Only then could modification of the European-colonial relationship be considered. Contemporaneously, American soldiers and marines

distilled the lessons of the Philippine-American War of 1899–1902 and the Caribbean “banana wars” of 1914–1934 into something that approximated later theories of counterinsurgency. This process was reflected in the U.S. Marine Corps’ *Small Wars Manual* (1935, revised 1940), which stated that the defeat of the guerrilla force in the field was an enabling event necessary to achieve the fundamental aim of the overall campaign: the social, economic, and political development of the people freed from the depredations of the guerrillas. However, lessons from the Philippines, Haiti, the Dominican Republic, and Nicaragua vanished from the American military’s institutional memory in the aftermath of the great amphibious and maneuver campaigns of the Second World War and the emerging demands of the Cold War.

Another category of irregular warrior emerged in the mid-20th century: the partisan. The German occupation of eastern and then western and southeastern Europe produced ferocious, if small-scale, struggles in rural France, Italy, Greece, and Yugoslavia, and the vast areas of the Soviet Union occupied for varying lengths of time by the German army before its eventual collapse, to which the various national partisan movements made significant contributions. While many partisans were uniformed soldiers who had evaded capture by the occupiers, others were armed civilians reminiscent of the 18th-century *levy en masse*: left-wing political militants, conservative patriots, and intellectuals. In East and Southeast Asia, the Japanese also faced partisan movements of varying degrees of size, tenacity, and allied support in Burma, French Indochina, Dutch Indonesia, the Philippines, and China. The Greek communist partisan movement transformed itself into an insurgency against the royalist restoration in Greece, while armed resistance in French Indochina and Dutch Indonesia became the nucleus of subsequent national liberation movements that sought to prevent the return of the former colonial occupiers in the aftermath of the sudden Japanese military collapse.

The most sophisticated, sustained, and successful insurgency of the 20th century was the “people’s war” of the Viet Minh and North Vietnamese, an extension of Mao Zedong’s earlier synthesis of *protracted warfare*. In protracted warfare (usually translated into English during the 1960s as *revolutionary warfare*), guerrilla warfare was one of

three forms of fighting, along with “positional” and “mobile” warfare, to be hierarchically employed as objective conditions dictated. The overall struggle could take decades to develop from initial establishment of a clandestine political organization to the final victory against the enemy’s conventional maneuver forces. In his 1930 exhortatory essay “A Single Spark Can Start a Prairie Fire,” Mao distilled the essence of guerrilla warfare as “the enemy advances, we retreat; the enemy camps, we harass; the enemy retreats, we pursue” (p. 124). Guerrilla warfare was understood as a temporary, transitional means of husbanding strength and allowing time for the development of progressively more sophisticated forms of military organization and technology. A protracted struggle would move through three successive stages: (1) Mobilization, (2) the Strategic Equilibrium, and (3) the Strategic Offensive, with the most critical political decisions being made at the temporal points of transition between stages. Both the Chinese and North Vietnamese communists progressed from “guerrilla” to “mobile” warfare as the waning strength of their opponents permitted. Thus, 1961’s “guerrilla in black pajamas” walking down the Ho Chi Minh trail with a captured French rifle and a few Chinese hand grenades foreshadowed the Soviet-supplied T-54 tank crashing onto the grounds of the South Vietnamese Presidential Palace in April 1975.

Vietnam and Beyond

The 1960s was the “decade of the guerrilla.” These years witnessed the Cuban Revolution, Soviet President Nikita Khrushchev’s January 1961 “Wars of National Liberation” speech, the final wave of decolonization struggles in Asia and Africa, the emergence of “flexible response” as the United States’ doctrine for deterring Soviet expansion in an era of nuclear parity, and an explosion of academic studies of “limited,” “unconventional,” and “guerrilla” warfare. Unfortunately, the understanding of guerrilla warfare within the national security community remained subordinated to the nation’s overall strategic posture: the global containment of the USSR. Neither scholars with influence in the corridors of power nor soldiers in positions of command grasped the implications of the term *protracted* in Mao’s doctrine of protracted war, or its North Vietnamese refinement.

The Kennedy administration conducted a much-publicized expansion of the American unconventional warfare capability: the U.S. Army Special Forces (Green Berets), the U.S. Navy SEALs, and the Air Force Air Commandos. However, this marginally increased level of attention to a third form of struggle neither nuclear nor conventional failed to solve the United States’ problem during the Vietnam War of 1965–1973. A fundamental assumption of U.S. policymakers was that the guerrilla, anywhere in the Third World, was either a misguided peasant resisting “modernization” or a tool of Soviet subversion led by indigenous Marxists. The possibility that he or she might have genuine grievances that must be addressed politically by the national leadership (the key insight of post-2006 U.S. counterinsurgency doctrine) was never seriously addressed. Second, the guerrilla was viewed as presenting novel and potentially difficult challenges *tactically*, but not at the operational or strategic levels of war. When the U.S. troop bases in South Vietnam expanded during 1965, the army tasked its Special Forces teams to organize Montagnard minority groups into anticommunist guerrilla forces, while the “big battalions” conducted airmobile operations along the Cambodian and Laotian borders. Internal pacification, the single most important mission, was left to the army of the Republic of Vietnam. Thus, the overall U.S. effort remained stalemated, as neither the senior military leadership nor two successive commanders in chief understood the struggle to require a protracted, integrated counterinsurgency campaign supported by a unified effort to build the institutional capacities of the Republic of Vietnam, as opposed to a counterinfiltration guerrilla-killing campaign, in the face of numerous obstacles to the implementation of that effort, including the profound limitations of the South Vietnamese government and military.

Another form of guerrilla struggle during the 1960s was the Cuban concept of the *foco*, or focal point, a form of vanguardism that succeeded only once, in Cuba, and which could not be replicated elsewhere in the hemisphere, as its chief proponent, Ernesto “Che” Guevara, discovered in Bolivia in 1967 at the cost of his life. Embrace of the *foco* hinged on a belief that a small band of dedicated and charismatic fighters could create the conditions for a successful insurrection simply by spectacular initial attacks on symbols of the hated regime.

However, the Cuban Revolution's "triumph" occurred because a corrupt ruling elite had already been delegitimized by the island's educated, U.S.-oriented middle class, the very elements who, ironically, were expropriated by the Revolution after its Leninist turn. The Maoist emphasis on long-term preparation of a deep-rooted political organization was replaced in *focoismo* by an existential leap of faith. Subsequent movements outside Cuba frequently collapsed into sterile terrorism, triggering ferocious repressive campaigns lasting years and ending with the death or capture of high-profile "urban guerrilla" leaders such as Carlos Marighella (Brazil, 1969), Raul Sendic (Uruguay, 1972), or Abimael Guzman (Peru, 1992). Attacks against revered symbols of the *patria*, or homeland, made political concessions unthinkable, while the eagerness of security forces to counterescalate indefinitely with extreme brutality, unrestrained by independent legal structures, inflicted widespread trauma on the populations so afflicted.

Conclusion

In fall 2006, the American effort to contain simultaneous Sunni and Shia insurgencies in Iraq seemed doomed to certain and immediate failure. However, the *possibility* of success was snatched from the jaws of *certain* failure with a revitalization of the U.S. counterinsurgency doctrine, as enshrined in Field Manual 3-24, *Counterinsurgency*, and the Iraq troop surge of 2007–2008, in both of which General David Petraeus assumed a directing role. Using Field Manual 3-24 as a "playbook" for his subordinate commanders, Petraeus directed the American effort away from the "kinetic" targeting of insurgent cells to the pursuit of population security and the suppression of interethnic violence and expanded efforts to achieve the political compromises necessary to assert the sovereignty of the Government of Iraq. Whatever the U.S. military achieved in Iraq resulted not from the killing of individual insurgents but on an understanding of the insurgency's internal contradictions and vulnerabilities, a lesson that the United States has taken a very long time to learn.

GULF WAR SYNDROME

The Persian Gulf War, also called the Gulf War or Gulf War I, began on August 2, 1990, when Iraq invaded neighboring Kuwait. On January 17, 1991, multinational forces led by the United States acted to circumvent Iraq's invasion and annexation of Kuwait, largely through air strikes. The ground war began on February 23, 1991, and ultimately ended on February 28, 1991.

In the months following their return to the United States, Gulf War veterans began to report various ailments. Ill veterans and the news media were at the forefront of the often controversial notion that there was a Gulf War syndrome that was linked to service in the Persian Gulf. While some viewed the syndrome as a new disease, others insisted the symptoms experienced by Gulf War veterans were

either unrelated to their service or were manifestations of posttraumatic stress disorder (PTSD). More than 20 years later, the military, government, and medical community have yet to reach a consensus, with disagreements ranging from identifying a list of symptoms, potential causes of illness, and the validity of Gulf War syndrome as a new disease. In 2008, the Research Advisory Committee on Gulf War Veterans' Illnesses determined that there was a serious multisystem illness, affecting approximately 25% of the 700,000 American veterans of the Persian Gulf War. Following this report, the Veterans Administration (VA) formally requested the Institute of Medicine (IOM), a not-for-profit organization under the National Academy of Sciences, to evaluate all available data. The resulting *2010 Gulf War and Health: Volume 8. Update on the Health Effects of Serving in the Gulf War* found that there is not sufficient evidence to support the establishment of Gulf War syndrome as a new disease. This entry examines the debate over whether Gulf War syndrome is a new disease or a manifestation of other disorders, and it discusses controversial findings.

Emergence of Gulf War Syndrome

In preparation for war against Saddam Hussein's army, all American military personnel were required to receive vaccines and oral medications. The aim was to safeguard troops from the potential use of nerve gasses, like sarin and mustard gas, and biological weapons, including anthrax and botulinum toxin. One of the oral medications used to protect soldiers from nerve gas exposure was pyridostigmine bromide. Soldiers began to feel the effects of the medication in-theater, with symptoms akin to low levels of nerve gas exposure. On returning home from the Persian Gulf, veterans began to report symptoms that were not in themselves indicative of any one disease. Symptoms included fatigue and sleep disturbances, skin rashes, rheumatologic disorders, headaches and memory loss, shortness of breath and respiratory problems, gastrointestinal disturbances, and sensitivity to common chemicals.

Numerous studies indicate that, in the years following their deployment to the Gulf region, Gulf War veterans reported generalized symptoms at rates two to three times higher than veterans of other foreign wars. While there was no official

acceptance of a new disorder, clinicians generally classified most of the symptoms as musculoskeletal or psychological. Many believed that veterans were experiencing PTSD manifested predominantly through physical rather than emotional complaints. Other mood disorders were also used to explain the increased somatic complaints among returning Gulf War veterans.

Clinicians and scientists sought other causes for the rise in illness among Gulf War veterans and the Gulf environment. Although environmental hazards varied by location throughout the war, scientists believed that this mysterious set of symptoms could be explained if there was a link between the vaccinations and oral medications soldiers took prior to and during the war with exposure to various toxins. In 1998, Congress established the Research Advisory Committee on Gulf War Veterans' Illnesses. By January 2002, the then secretary of veterans affairs Anthony J. Principi appointed members to the committee, which included physicians, pharmaceutical executives, and veteran's health advocates. Clinicians represented multiple fields, including neuroanatomy, neurobiology, rheumatology, neurogenetics, internal medicine, epidemiology, neurotoxicology, teratology, and immunology. The goal of the committee was to recommend necessary research related to the health of Gulf War veterans to the secretary of veterans affairs. In 2008, the committee presented its findings and recommendations, officially stating that there was scientifically based evidence supporting the earlier hypotheses that Gulf War syndrome was caused by the pretreatment medications and vaccines when the veteran was also exposed to pesticides and other chemicals.

Conflicting Reports, New Protocols

The official report of the Research Advisory Committee on Gulf War Veterans' Illnesses concluded that Gulf War syndrome is caused by conditions experienced while soldiers were serving in the conflict. The combination of the prophylactic nerve agent pyridostigmine bromide with pesticides used during the war is believed to cause this syndrome. Other interactions, including multiple vaccinations and exposure to additional environmental toxins, may also play a role. Environmental toxins include the petroleum smoke from more than 600 oil wells that were set ablaze. There is no evidence that

exposure to depleted uranium, the anthrax vaccination, or infectious diseases played a direct role in Gulf War syndrome. New research suggests that Gulf War veterans develop amyotrophic lateral sclerosis at higher rates than other veterans. Gulf War veterans potentially exposed to nerve gasses are developing and dying from brain cancer at rates higher than other veterans. Given the complex symptom profile and past assertions by clinicians, the report clearly differentiates Gulf War syndrome from PTSD and other psychological illnesses. Moreover, the rate of PTSD among Gulf War veterans is lower than veterans of other foreign wars.

After considering the Research Advisory Committee's findings, the VA looked to the IOM for additional research. Its report, *Gulf War and Health* (2010), offers views that were more favorable to the VA. It agreed that veterans deployed during the Gulf War often reported symptoms indicative of multi-system illnesses. However, the IOM concluded that Gulf War syndrome was not a new, unique disease, but accepted that there are multisymptom illnesses that are unexplained and believes they are linked to service in the Gulf War.

The study details the various health outcomes it believes are linked to service in the Gulf War. According to the IOM study, the only health outcome definitely linked to Gulf War deployment is PTSD. There is limited causation between deployment and amyotrophic lateral sclerosis, fibromyalgia, and other chronic pain disorders. The report found that there is insufficient data to conclusively link deployment to any specific cancers, blood disorders, multiple sclerosis, cardiovascular disease, and respiratory disorders.

After reviewing both the Research Advisory Committee and the IOM's findings, the VA made the decision not to classify Gulf War syndrome as a disease. However, the VA continues to treat the complex symptoms that plague a third of all deployed Gulf War veterans each year. While there is no known cure for the symptom profile, clinicians have had some success treating the symptoms. However, there is little evidence to suggest that the affected veterans' health improves with time. As veterans present with worsening symptoms, researchers continue to search for a successful treatment protocol. As indicated in the IOM study, new, larger research trials are being designed that are more representative of the deployed population, include deployed and

nondeployed soldiers during the Gulf War, create better classification systems for symptoms, and better incorporate each soldier's social history, including tobacco and alcohol use. As new studies are planned, the struggle between veterans groups and the VA continues. The VA is reluctant to give a name to the set of symptoms many Gulf War veterans face. Many affected soldiers believe that identifying Gulf War syndrome as a disease would be a positive step on the often uncertain path of treatment.

GUNS, MACHINE

Originally conceived and implemented in the late 19th century, the machine gun is an automatic weapon capable of sustained fire. From submachine guns to heavy automatic weapons, the caliber of ammunition rapid fired and the size of the gun bore determine the designation of the gun. Reflecting the birth of industrialized warfare and used in mass quantities during World War I, machine guns have inflicted millions of casualties and subsequently

changed the nature of warfare. They remain a permanent fixture on the contemporary battlefield. This entry discusses the development of machine guns and types of machine guns in use today.

Historical Development

Despite their widespread military appeal, the impetus for adopting machine guns began in the private sector. During the 19th century, newly formed corporate entities found particular utility in the concept of sustained automatic fire for the purposes of dissuading working-class protests. Though initially wary of employing them against each other, European colonial powers married the machine gun with their expansionist designs, depending on them as force multipliers to deter natives from resisting European colonial influence. This led to the famous adage of the historian Hilaire Belloc in *The Modern Traveller*, 1898: “Whatever happens, we have got The Maxim gun, and they have not” (p. 37).

Richard Gatling was the first to patent a modest-sized, reliably functioning machine gun in November 1862. Crank operated, it fired 200 rounds a minute. Gatling cited the American Civil War (1861–1865) as the inspiration for his invention; ironically, he believed the gun would obviate the need for massive mobilization because a single soldier could wield the firepower of hundreds with a single Gatling gun. Though the gun only saw service in the very last year of the war, it impressed other nations, including England, Japan, and Russia, which quickly placed orders for Gatling guns.

In 1884, Gatling’s hand-cranked version gave way to Hiram Maxim’s gun. It was a “true” machine gun, capable of continuous fire by harnessing recoil energy to eject and load cartridges. The user merely had to depress the trigger to sustain fire. Though at first Maxim had difficulty persuading militaries to adopt his creation in their service, eventually, by way of a competitive set of corporate mergers, his gun achieved moderate sales success and made it to European powers in the two decades following its invention. It was on the battlefields of World War I, however, that sales skyrocketed and the true potential of the Maxim gun was realized.

The machine gun came of age during World War I. At first, the major European powers failed to recognize the potential of Maxim’s gun, now 21 years old. Nevertheless, the weapon increased in

prominence as the war progressed until, eventually, it came to dominate the battlefield. As the Western Front settled into a stalemate, the combatants distributed machine guns more and more throughout their lines to resist massive waves of infantry assault. The power of industrialized warfare, replete with artillery, gas attacks, and machine guns, created a vast wasteland known as “no man’s land” between the opposing European forces. In this climate, warring powers threw away entire generations of men against skillfully placed machine guns.

World War I revealed the potency of sustained fire against infantry assault. Following that conflict, men such as John Browning, John Thompson, and Mikhail Kalashnikov began to develop and refine the machine gun into what would become its modern iteration. Their focus was to maintain the level of automatic fire while improving portability for use in offensive and defensive combat schemes.

Contemporary Utilization

In their contemporary designs, the submachine gun, light machine gun, recoilless automatic rifle, and vehicle mounted crew-served machine gun all developed from the desire to make the machine gun more compact and transportable. Following drastic increases in portability and compactness, the immense firepower the machine gun provides has spread throughout the modern battlefield, permitting greater flexibility and lethality for smaller units. In addition to its use within the infantry, machine guns are also found in varying forms on naval vessels, aircraft, and land vehicles serving in a variety of roles to include suppression, support, and anti-aircraft.

In the contemporary world, the machine gun remains a potent and flexible staple of warfare. Within the U.S. Army, three of the most common variants are (1) the M249 SAW (Squad Automatic Weapon) manufactured by Fabrique Nationale de Herstal, (2) the M240B (commonly referred to as the M240 Bravo) awarded to Colt manufacturing in Fall of 2009, and (3) the M2 .50-caliber machine gun manufactured by General Dynamics, U.S. Ordnance, and Fabrique Nationale de Herstal. The SAW, which can be fired from a bipod, the hip, or underarm, provides its squad great mobility as well as a high-sustained rate of fire capable of matching the firepower of 10 to 20 riflemen. Capable of

A U.S. soldier with the 3rd Squadron, 2nd Stryker Cavalry Regiment, looks down the sight of his M249 light machine gun in Azizullah, Afghanistan, January 4, 2011, in preparation for Operation Air Wolf.

Source: U.S. Army photo by Corporal Robert Thaler (released).

providing more accurate and stable firing than the lighter SAW at longer ranges, the M240B is a tripod-mounted, general-purpose machine gun effective for supporting and suppression fires, serving as an integral part of its unit fire direction plan. Categorized as a heavy machine gun, the M2 .50-caliber is one of the most storied machine guns with an equally versatile history. Standardized in 1933, the .50-caliber and its numerous iterations have served as tank, aircraft, and antiaircraft weapons. One of the reasons for the gun's flexibility derives from the interchangeability of its parts, permitting the weapon to be used in a variety of roles on the battlefield. All three machine guns—(1) the M2 .50-caliber, (2) the M249 SAW, and (3) M240B—reflect the exigencies of modern combat, which require both overwhelming

firepower and unmitigated mobility to maximize the offensive and defensive capabilities of the smallest military units in order to dominate a sector of the battlefield.

HAGUE CONVENTIONS

The Hague Conferences of 1899 and 1907, also known as the Hague Peace Conferences, are two extremely important events regarding international law and were held in The Hague, Netherlands. As of June 2007, the First Hague Convention had 73 signatories and the Second Hague Convention had 85. A third Hague conference was to take place in 1914, later rescheduled to 1915, but never materialized due to the inception of World War I. The initial conference was requested by Czar Nicholas II of Russia in 1898. Invitations to the conference were received with great excitement and optimism. The conference was set to focus largely on disarmament and obligatory arbitration. Several agreements and declarations regarding the rights and laws of war were created from the conference and later ratified by several states. Although the Hague Convention attempted to change the mentality that if one wanted peace one had to prepare for war, the goal of disarmament was largely a failure. One of the greatest accomplishments that came out of the conferences was the establishment of the Permanent Court of Arbitration, the oldest institution for international dispute resolutions. This achievement preceded and, in several ways, set the groundwork for the Permanent Court of International Justice, which was created in 1920 as a semiautonomous organ of the League of Nations. Thus, the conference may have failed regarding disarmament but was able to drastically improve the laws of war and, furthermore, was able to make advancements in the codification

of such laws. This entry describes the content of the Hague Conventions of 1899 and 1907.

The First Hague Convention (1899) was made up of four main sections and three separate declarations. The four sections included (1) the pacific settlement of international disputes, (2) the laws and customs of war on land, (3) the adaption to maritime warfare of principles of the Geneva Convention of 1864, and (4) the prohibition of launching projectiles and explosives from balloons. The declarations to the convention were on (1) the launching of projectiles and explosives from balloons; (2) the use of projectiles, the object of which is the diffusion of asphyxiating or deleterious gases; and (3) the use of bullets that expand or flatten easily in the human body.

The Second Hague Convention (1907) was largely an expansion of the previous with some modifications of and additions to previous agreements. There was also a greater focus on naval warfare. The convention was made up of 13 sections, 12 of which were ratified and later entered into force. These included (1) the pacific settlement of international disputes, (2) the limitation of employment of force for recovery of contract debts, (3) the opening of hostilities, (4) the laws and customs of war on land, (5) the rights and duties of neutral powers and persons in case of war on land, (6) the status of enemy merchant ships at the outbreak of hostilities, (7) the conversion of merchant ships into warships, (8) the laying of automatic submarine contact mines, (9) bombardment by naval forces in time of war, (10) adaption to maritime war of the principles of the Geneva Convention, (11) certain restrictions

with regard to the exercise of the right of capture in naval war, (12) the creation of an International Prize Court—this section was not ratified, and (13) the rights and duties of neutral powers in naval warfare.

There is no doubt that both Hague Conventions have clearly had a large impact on the laws of war and how states interpret them. In fact, both Hague Conventions as well as the Geneva Conventions make up the Laws of Armed Conflict and are, as such, an integral part of International Humanitarian Law. Reviewing the restrictions clearly stated in the proclamations of the conference helps illustrate their impact. For example, bullets that either expand or flatten easily within the human body on impact have been removed from any states' arsenals. Furthermore, the declaration has now become customary international law; the prohibition of such bullets applies to all states, including those that have not ratified the treaty. This means that the prohibition of such bullets has become such a fundamental law that no state dare violate it. If there is any violation of the conventions, it can be prosecuted by the International Criminal Court.

The U.S. government and its armed forces have especially been influenced by the conventions in both their interpretations and implementations of the laws of war presented in each conference. Examples of this influence can be seen in the U.S. armed forces' adherence to such laws as targeting only enemy combatants, the humane treatment of all individuals (both civilians and soldiers alike), and the prohibition of unlawful killing and torturing of detainees as well as medical personnel. Furthermore, the U.S. armed forces must always attempt to protect all enemies who have surrendered as well as cause no more damage than is needed to accomplish their mission. All of these policies have been implemented with stronger force, following the declarations made more than a century ago in The Hague, Netherlands.

HAITI

Haiti is a small Caribbean nation that shares the island of Hispaniola with the Dominican Republic. With its capital in Port-au-Prince, Haiti occupies the western third of Hispaniola, a total of 27,750 square kilometers (10,714 square miles), roughly equivalent to the size of the state of Maryland. Originally called Ayiti, “land of high mountains,” by the indigenous Taíno Amerindians, the island is rough and mountainous with a mix of tropical and semiarid climate. In 2011, Haiti’s estimated population numbered more than 9.7 million people.

The history of Haiti tells a story of unceasing decline, marked by revolutionary accomplishment and deterioration that has left the country in shambles. Once the richest colony in the world, Haiti is today the poorest nation in the Western Hemisphere. Glimmers of democracy in 1990 quickly faded as political instability, economic hardship, and natural disasters continually interrupted any chance of recovery and development. This entry discusses the history of Haiti dating back to its colonial period, paying particular attention to political and economic factors that have weighed so heavily on its people.

Early History

Haiti first encountered the West when Christopher Columbus discovered Hispaniola in 1492. The territory transferred to French rule in 1697 and flourished economically on the backs of African slaves in one of the world’s cruelest systems of colonial slavery. Influenced by the French Revolution, Haitian slaves

began a decade-long rebellion against the French colonial government in 1791. The famed slave general Toussaint l'Ouverture defeated French, English, and Spanish efforts, only to be kidnapped and left to die in a French prison. Haitians under the vicious leadership of Jean-Jacques Dessalines ultimately continued the war and won their freedom in 1804.

Despite independence, pervasive cultural divisions survived the collapse of the colonial system and remained in Haiti's culture. After the collapse of plantations, Creole-speaking Blacks returned to agricultural work while French-speaking mulattos gravitated to politics, cities, and agricultural export business. The division shaped Haiti's future for years to come and largely defined who acquired wealth and power. Faced with a French invasion and re-enslavement in 1825, Haiti's government agreed to pay 150 million gold francs to its extortioners; the debt consumed most of the young nation's wealth until 1947 and greatly hindered political and economic development.

Constant political turmoil and European interest in Haiti spurred the United States into a military intervention and subsequent occupation that lasted from 1915 to 1934. Occupation forces including marines and navy personnel took over Haiti's finances, rebuilt infrastructure, and established a professionalized Haitian military. In spite of improvements, forced labor, racism, and civilian deaths at the hands of marines turned Haitians against the occupation. Not long after the U.S. forces left in 1934, Haiti reverted to political instability as the imposed institutions quickly disintegrated.

After years of instability, the Duvalier family dictatorships consolidated power and ruled Haiti from 1957 until 1986. Led by father, François "Papa Doc" Duvalier, and, later, son, Jean-Claude "Baby Doc" Duvalier, the regime ruled with fear enforced by ruthless paramilitaries, including the carefully crafted Tontons Macoutes and Leopards. During their reign, the Duvaliers enjoyed enormous foreign aid and military support that built their security apparatuses while they embezzled millions intended for public infrastructure. Their legacy remained into the 2000s, as some Duvalierist Haitians preferred the stability of the dictatorship regardless of the violent repression and murder that accompanied it. Pressure from the Haitian people forced Jean-Claude into exile in 1986, when he absconded to France with hundreds of millions of dollars stolen from the Haitian people.

Despite the repressive grip of the Duvalier regime, Haiti witnessed the rise of social movements as Haitians increasingly demanded change during the 1980s. In rural areas, farming groups came together to improve farming infrastructure and form cooperatives, while urban groups focused on workers' and women's rights as well as fighting poverty. Haiti's poor fought an uphill battle and faced constant violent reprisals by post-Duvalier military regimes and former Tontons Macoutes. Father Jean-Bertrand Aristide, a charismatic Catholic priest from Port-au-Prince's La Saline slum, arose as a champion of liberation theology and Haiti's poor. In spite of efforts to silence him, Aristide pushed on in defiance to become a symbol of the social justice movement with staunch support from Haiti's poor.

Haitian Democracy and Economy

During Haiti's 1990 UN-observed election, Aristide won by a landslide 67% of the vote in a field of 12 candidates. His campaign arrived late but won over poor Haitians when Aristide criticized the hierarchy of the Catholic Church, the rich elite class, and the United States for obstructing Haitians from achieving true justice and equitable democracy. Many considered his populist agenda to raise the minimum wage, redistribute land, enforce taxes, stop drug trafficking, and separate the military from the police as a radical attack on established powers. Aristide became Haiti's first democratically elected president, but Haiti's legacy of instability returned only a few months later.

Eight months after Aristide's election, the Haitian military under General Raoul Cedras led a coup d'état in September 1991. Intrigue surrounded the coalescence of leaders including Cedras, who received U.S. training, and his associates, who had deep ties to drug trafficking. Between 1991 and 1993, the military government and various paramilitaries killed and jailed thousands of Haitians, particularly those associated with social movements and Aristide's Lavalas coalition. One prominent paramilitary led by Emmanuel Constant, the Front for the Advancement and Progress of Haiti, had significant ties with the U.S. Central Intelligence Agency. The violence forced thousands of poor Haitians and political refugees to flee to destinations including the United States, where the migrants sparked public concern over illegal immigration.

The international community levied UN sanctions against General Cedras's military regime, but U.S. presidents George H. W. Bush and Bill Clinton made exemptions for American companies to continue business as usual. Many argue that these exemptions helped the military regime and elite Haitian businessmen continue to profit from oil and exports, in addition to a resurgent illicit drug trade long associated with Haitian military and police forces. In Washington, D.C., President Aristide lobbied the U.S. government and the United Nations to restore his presidency. An initial effort during the 1993 UN Governor's Island Agreement fell through, but a UN Security Council resolution ensured Aristide's return.

With permission from UN Security Council Resolution 940, the United States began to train for a military intervention later named Operation Uphold Democracy. Pentagon planners prepared for both a forced and a permissive entry mission, but last-minute negotiations headed by the former president Jimmy Carter and accelerated by threats of military invasion led to a peaceful transition. Twenty thousand U.S. soldiers and 2,000 international personnel led an interim peacekeeping mission meant to secure Haiti, stabilize civil administration, and train police officers before Aristide's formal return. Before leaving office, Aristide disbanded the Haitian military with strong public support for a future free of military oppression. Aristide was replaced in 1995 by his prime minister, René Préval, who led a much less contentious but similar administration.

Once rich in agricultural resources, Haiti's agricultural sector had slowly wasted away. At its colonial height, Haiti produced two thirds of the tropical fruit imported by Europe. It continued to export coffee, sugar, and cotton, among other crops, until a serious decline during the Duvalier period. At the same time, deforestation left only 2% of Haiti's forests and worsened flooding, soil fertility, and erosion. Free market agreements and foreign aid also flooded Haiti with extremely low-cost, subsidized foodstuffs that crushed Haiti's small farmers. Unable to survive, rural Haitians migrated to sprawling urban slums with high hopes only to find little or no access to water, food, and health care.

Also during the 1980s and 1990s, Haiti witnessed the expansion of low-wage manufacturing. By 1984, Haitian factories ranked ninth in the production of U.S. assembled goods that ranged from baseballs to T-shirts. International trade partners and

financial institutions, including the U.S. Agency for International Development, touted manufacturing as Haiti's economic savior, but factory jobs only paid an average of \$1.60 per day. Low pay and antiunion provisions earned Haiti's sweatshops negative publicity in the United States. Both Aristide and Préval fought to raise the minimum wage, and Préval won significant improvement in unemployment despite privatization of government-owned corporations.

Aristide's Return and Coup

In 2000, Aristide swept back into the presidency with 92% of the vote in an election marred by widespread charges of fraud. President Préval left office in 2001 and peacefully transferred power to Aristide. During the final year of Préval's presidency, opposition parties fomented parliamentary gridlock that carried into the 2000 elections. Accusations of fraud in the parliamentary elections soon led to a U.S.-induced aid embargo that blocked \$500 million in Inter-American Development Bank loans despite remediation of the initial conflict. Without outside aid, Aristide stretched the meager Haitian budget to accomplish major infrastructural improvements before another coup removed him in 2004. As civil unrest spread through Haiti, the former Front for the Advancement and Progress of Haiti and military forces swept into the capital. Controversy over Aristide's flight from Haiti remains, pitting his assertion of kidnapping against the U.S. State Department's contention that he fled voluntarily with their assistance. The U.S. and international forces arrived a short time later with 3,000 soldiers under Operation Secure Tomorrow in February 2004. The U.S.-led effort attempted to quiet the unrest prior to the takeover by the UN Stabilization Mission in Haiti (MINUSTAH) that June.

Haiti After Aristide

Haiti's misfortune remained long after the coup with continued reprisals, political turmoil, and popular unrest. Shortly after Aristide left Haiti, reprisals against Fanmi Lavalas party supporters mounted as key criminals were allowed out of prison. The 2006 elections restored René Préval as president amid more disputed elections. In the following years, Préval confronted a food shortage crisis in 2008 that brought angry mobs into the streets. Making matters worse, UN occupation forces met widespread

Soldiers patrol a crowd of demonstrators during a protest in Port-au-Prince. On September 23, 1993, the UN Security Council authorized the establishment and immediate dispatch of the UN Mission in Haiti for a period of 6 months. In 1991, President Jean-Bertrand Aristide was ousted in a military coup, living in exile until September 1994, when a 28-nation multinational force, led by the United States, intervened and occupied Haiti until Aristide was allowed to safely return to office.

disapproval over slum raids that commonly wounded and killed civilians and a 2010 cholera outbreak that claimed 5,000 lives. Leaked U.S. diplomatic documents from WikiLeaks later detailed the troubled U.S.-Haiti relations between 2004 and 2010, including Préval's struggles over oil, minimum wage improvements, UN occupation forces, and the 2010 earthquake.

On January 12, 2010, an earthquake of magnitude 7 in Haiti killed between 200,000 and 250,000 Haitians and wrought damages estimated between \$8 and \$14 billion, primarily in Port-au-Prince. In response to the earthquake, the U.S. launched Operation Unified Response with 17,000 troops that provided much needed medical care, logistical support, and a ground security force despite existing

UN peacekeepers. Over the next year, the international community pledged \$4.6 billion, but 1 year later, less than half had been disbursed. International aid had appeared to promise a brighter future for Haiti, but the miserable status quo returned.

Haiti's Future

Moving on from the earthquake, Haiti's future remains as unpredictable as ever. Elections in December 2010 again sparked angry debates over legitimacy that only slightly quieted after a 2011 runoff that declared the former musician Michel "Sweet Micky" Martelly as Haiti's new president. The resurgence of Duvalierism and Martelly's efforts to re-create the Haitian military raise questions about the future and viability of

Haitian democracy. Additionally, the return of the former exiled leaders Jean-Claude Duvalier and John Bertrand Aristide excited Haitian politics. The 2011 expiration of the Interim Haiti Recovery Commission charged with distribution of foreign aid further stands to threaten post-earthquake aid as donors worry over the misuse of funds in the commission's absence. Finally, promises to lift Haiti's poor from despair come into question with the national infrastructure and economy in ruin and environmental squalor threatening the productivity of rural agriculture. The only certainty is that Haiti's recovery will be an uphill battle as difficult as ever.

HAITI, U.S. INTERVENTION IN

Beginning with the Spanish-American War in 1898 and throughout the first four decades of the 20th century, military forces of the United States of America occupied much of Central America. Many reasons were given for these interventions in other sovereign nations, such as protecting American interests, quelling indigenous rebellions, establishing democratically based governments, maintaining political stability, and minimizing European influence. The U.S. Marine Corps played significant roles in these

interventions and ongoing operations that came to be known euphemistically as “banana wars” or officially as “small wars.” Of the many deployments by marines, Haiti represented the most challenging occupation because of its political corruption, economic exploitation, constant infighting, and religious division. This entry discusses the history of U.S. intervention in Haiti, lessons learned by the U.S. military, and historical interpretations of the intervention.

Historical Overview and Key Events

Since its bid for independence in 1804, Haiti endured many bloody rebellions and violent changes in government. In the years between 1911 and 1915, for example, six Haitian leaders were overthrown and replaced in rapid succession. The nation's economic situation was also in poor shape because its government had slipped into debt to the United States, Germany, and other nations. Haiti's president Vilbrun Guillaume Sam established a dictatorship in early 1915, but he could barely control the government, let alone maintain order in the nation as a whole. Sam was overthrown, and his body torn apart by an angry mob. The chaos threatened American commercial and financial interests and political stability in Haiti and the region. A stable Haiti would help ensure a peaceful Caribbean and a secure Panama Canal in the face of increasing German threat after the First World War started. Thus, it should have come as no surprise when the president of the United States Woodrow Wilson ordered 340 marines and sailors to land in Haiti's capital of Port-au-Prince and restore order on July 28, 1915. This began a 19-year occupation by the American military during which as many as 3,000 marines served in Haiti.

Ever the progressive and idealist, President Wilson hoped that the American presence in Haiti could help its people negotiate a resolution to their internal conflicts, establish a democratic system, and organize an indigenous police force, known as a constabulary, capable of supporting a new government. In the summer of 1915, Rear Admiral William B. Caperton, the first American commander, declared martial law and took control of Haiti's custom houses. The Haitians found themselves forced to elect a president—Philippe Sudré Dartiguenave—whom the Americans would find malleable and agreeable. In reality, however, neither the Americans nor their several client rulers exerted real power in

the countryside as long as bandits, mercenaries, and revolutionaries, whom the marines called *cacos*, disrupted the functions of the Haitian government and undermined American influences. During these early years, Major Smedley D. Butler of the Marine Corps won notoriety in Haiti and received a congressional Medal of Honor for fighting to suppress the Haitian insurgency. As many as 5,000 *cacos* enjoyed relative success when led by charismatic leaders like Charlemagne Peralte in 1918. However, he and other leaders were eventually captured or killed, and the *cacos'* level of activity declined by 1922.

Differences in class, race, language, and religion compounded the difficulties facing the American marines in Haiti. A split existed between a wealthy minority of mixed-race *mulâtres* in the urban areas like Port-au-Prince and an illiterate majority of Black *noirs* in the urban slums and the rural agrarian communities. Adding to this was the fact that Haiti's elite spoke French, while the lower classes spoke Creole, which combined French and West African languages. Finally, the *mulâtres* followed Roman Catholicism, but the remaining Haitian populace practiced a mixture of Catholicism and voodoo. The two groups were thus incompatible. The marines grew to detest the urban Haitian elites as corrupt and oppressive, and voodoo practices notwithstanding, many marines developed sympathy for the poor Haitian peasants.

Haiti finally achieved relative stability in 1922 under American-backed client governments and the able leadership of John H. Russell, a Marine Corps brigadier general and the American high commissioner with rank of ambassador extraordinary, who directed civilian and military activities of the American occupation until 1930. A significant expansion of infrastructure in Haiti occurred during his watch. Among the highlights were construction of 1,000 miles of new roads and nearly 200 bridges as well as new hospitals and public buildings. Russell's initiatives also brought safer drinking water and improved sanitation to Haitian cities. Sugar and cotton increasingly became significant exports as Haiti's economy grew. Much of the new revenue, however, went to fund Haitian debt or to pay for American occupation forces. Russell achieved less success in establishing democracy in Haiti because elections were often farcical victories for the candidate or referenda supporting American interests.

One key to American efforts in Haiti was the Gendarmerie d'Haiti, a constabulary force that was renamed the Garde d'Haiti in 1928. Major Butler held the rank of major general, and Marine Corps sergeants received commissions as officers in Gendarme and Garde. The most well-known sergeant was Faustin Wirkus, who held the Haitian rank of lieutenant. He tried to learn Creole and understand voodoo practices on the island of La Gonâve where he served as commanding officer. Wirkus's exploits were popularized in the book *The White King of La Gonave* in 1931. Indigenous Haitians served as the rank and file in the Gendarmerie and Garde, and some eventually joined the officer corps. As the 1920s progressed, the Haitians accounted for the majority of the 2,000-man-strong constabulary force, while the number of marines in Haiti shrank to 500 during that decade. But the real influence and power consistently rested with the marines in the Gendarmerie and Garde.

The year 1929 marked a turning point in the American occupation of Haiti and heralded a withdrawal 5 years later. Economic problems caused labor strikes and street violence. In one incident, a marine patrol opened fire on rioting demonstrators in the coastal town of Aux Cayes and killed 12 Haitians. This so-called Aux Cayes Massacre caused a negative shift in American public opinion regarding the marines in Haiti. The tragedy also motivated the newly elected U.S. president Herbert Hoover to appoint the Forbes Commission, headed by and named after the former American governor of the Philippines, W. Cameron Forbes. The resulting investigation determined that American forces should leave Haiti. The Forbes Commission's finding helped usher John H. Russell out of Haiti, and the position of high commissioner was not replaced or renewed. Hoover began withdrawing American troops from Haiti and other Central American nations, and his successor, President Franklin D. Roosevelt, finished that process. In the place of occupation forces, Americans initiated a policy of Haitianization of government, judicial, and military functions designed to prepare Haiti for independence and autonomy. Haitian officers assumed more and greater authority in the Garde as they replaced exiting marine officers. The intervention ended, and the last marines left Haiti on August 1, 1934.

Despite idealistic intensions and often the best efforts, the legacies of the American occupation of

Haiti were those of missed opportunities and short-term successes. Haiti would eventually plunge once again into periodic shifts between dictatorship and anarchy. The elites still controlled enough resources to oppress the impoverished masses, and the Garde d'Haiti devolved into a vehicle for strongmen and coups d'état.

Lessons Learned and Historical Interpretations

Marines in Haiti enjoyed some significant successes, and many lessons can be gleaned from the intervention in Haiti. Marines led by the likes of Smedley D. Butler and John H. Russell helped establish Haiti's first, albeit marginally professional, constabulary security force in the Gendarmerie d'Haiti and later the Garde d'Haiti. These provided not only means for Haitians to gain vested interests in perpetuating a stable regime but also means for training Haitians in practical skills to help perpetuate that stable regime. Marines with help from the Gendarmerie and Garde halted banditry and rebellion of the *cacos*, which in turn made the rural areas safer and the benefits of secure communication and transportation more tangible for the Haitians living in the countryside. Americans supervised the construction of roads, hospitals, and other important public works designed to further stabilize and modernize Haiti's infrastructure. Marines undermined the power of the wealthy urban *mulâtres* and decreased the rampant corruption in the Haitian political and judicial systems. Marines laid a foundation for what they hoped would be democratic elections. In all, these efforts represented attempts to protect the Haitian populace and improve their everyday lives in hopes that they would find fewer reasons to turn to rebellion as an act of desperation or disruption. The marines, however, rarely appreciated or utilized cultural factors, like the Haitian practice of voodoo, to their advantage. Instead, marines too frequently tried to stop the practice of voodoo, and thus, they alienated many otherwise friendly Haitians.

Many of the lessons learned in Haiti and the rest of Central America were compiled by the Marine Corps Schools in Quantico, Virginia, in the 1930s and published in the *Small Wars Manual* in 1935 and in a revised and finalized version in 1940. Many decades later, these efforts in Haiti resemble what is termed *nation-building* in Operation Iraqi Freedom and Operation Enduring Freedom.

Moreover, the *Small Wars Manual* served as an important foundation for the recent *Army-Marine Corps Counterinsurgency Field Manual* completed in 2006.

One historical interpretation of the American intervention in Haiti and the Marine Corps's participation in the subsequent occupation can be found in the conventional histories of the Marine Corps like Allan R. Millett's *Semper Fidelis: The History of the United States Marine Corps* and James McCrocklin's *Gard D'Haiti: Twenty Years of Organization and Training*. Both of these books provide detailed narratives that include some analysis of the reasons for American successes or failures in Haiti as well as operational lessons to be learned from Haiti. They do not delve into issues of morality or ideological motivations for American intervention that the revisionist historian Hans Schmidt examines in *Maverick Marine: General Smedley D. Butler and the Contradictions of American Military History* or that the postmodernist scholar Mary Renda explores in *Taking Haiti: Military Occupation and the Culture of U.S. Imperialism, 1915–1940*. Schmidt traces what he sees as the evolution of Smedley Butler from a hard-fighting marine supporter of American intervention to a bitter critic of American imperialism. Butler's experiences in Haiti played a formative role in his change of opinion. Renda takes a different approach to Haiti by portraying the American occupation as a whole and marines in particular as agents of a *mission civilatrice*—American style. She argues that racism and paternalism provided twin cultural motivators for the mostly Anglo-Saxon, Protestant, Caucasian marines to try to force the Haitians to change and become more like the Americans. Apart from these historical interpretations is Keith B. Bickel's *Mars Learning: The Marine Corps Development of Small Wars Doctrine, 1915–1940*. Bickel's analytical survey of Marine Corps operations throughout Central America illuminates the learning processes and organization transformations of the Marine Corps during these 25 years and thereafter.

HALLIBURTON

Halliburton was one of the most prominent military support service providers in the 1990s and early 2000s, until its subsidiary Kellogg Brown & Root (KBR) separated from the company in 2006. Since then, Halliburton has operated within its core competency, the energy sector, while KBR continues to provide construction and engineering services as well as military support services, along with its joint ventures like Vinnell-Brown & Root and Vinnell Corporation, currently a subsidiary of Northrop Grumman. This entry examines the history and global scope of Halliburton and its subsidiaries.

Halliburton, founded in 1919, is one of the major providers of services and products in the energy industry. The company operates in 80 countries around the world with more than 100 subsidiaries. In 2002, Halliburton split its business into two distinct

entities, Halliburton Energy Services Group and KBR, to protect its assets from asbestos lawsuits that its subsidiary Dresser Industries, acquired in 1998, was involved in. KBR separated from Halliburton in 2006. The reasons given for separation vary: that KBR was a sideline to Halliburton's main interest of business, that KBR was fighting asbestos lawsuits, that its financial status was not very good and it was involved in inquiries of overcharging U.S. troop support in the Middle East, and that Halliburton's management believed that the value of KBR was not reflected in Halliburton's stock price, thus the two companies could realize their stock prices if separated. Halliburton restructured its operations into Eastern and Western Hemispheres in 2006, and in 2007, it restructured around two major divisions: (1) Drilling and Evaluation and (2) Completion and Production. The Drilling and Evaluation segment consists of Baroid Fluid Services, Sperry Drilling Services, Drill Bits, Wireline and Perforating Services, Testing and Subsea Services, Landmark and Consulting, and Project Management. The Completion and Production segment includes Production Enhancement Services, Completion Tools and Services, Cementing Services, and Boots & Coots, which consists of intervention services, pressure control, equipment rental tools and services, and pipeline and process services. Halliburton moved its operational headquarters to Dubai, leaving its offices in Houston. As of 2010, Halliburton revenues were \$18 billion.

Brown & Root was the main force behind Halliburton's involvement in military supply services. Founded in 1919 and incorporated in 1924, Brown & Root specializes in engineering and construction. In 1963, Brown & Root was sold to Halliburton for \$36.7 million, yet the two companies maintained separate operations under a loose corporate structure. Brown & Root focused on engineering and construction, while Halliburton operated in the oil sector. However, economic recession and languishing oil prices in late 1970s and early 1980s forced the two companies to establish a more streamlined corporate structure. Brown & Root Services (BRS), a subsidiary of Halliburton, was founded in 1986 to focus on government operations and support services. In 1998, KBR emerged with the addition of an oil-pipe fabricator, M.W. Kellogg, and operated as the subsidiary of BRS for military support services. In 2006, KBR was separated from Halliburton, and

it now operates independently in the areas of engineering, procurement, and construction in 45 countries on five different continents as well as provides military support services.

BRS has been providing military services in different forms since World War II. During World War II, BRS was awarded the construction of the Corpus Christi Naval Air Station and several U.S. Navy warships. During the Vietnam War, BRS won part of a \$380 million contract to build airports, bases, hospitals, and other facilities for the U.S. Navy in South Vietnam. In 1988, Vinnell-Brown & Root was awarded the contract for running support services at Incirlik Base in Turkey, along with two minor bases in Ankara and Izmir.

The main expansion in military support services came in the 1990s as the outsourcing of military services gained momentum and reached its peak in the 2000s, particularly after wars began in Afghanistan and Iraq. In the post-Cold War environment of the 1990s, military outsourcing became a viable option for conducting military operations given decreased military budgets, shrinking troop levels, and political constraints on using military force. Outsourcing military support services was considered advantageous as it freed troops from base duties and enabled higher numbers of troops at the front line by keeping troop levels at politically viable levels. Outsourcing was also considered economically cost-effective; it could decrease military spending, although the cost-effectiveness of military outsourcing is still a highly debated issue.

In the post-Cold War environment, BRS/KBR won contracts ranging from military planning to logistics and base support operations in the Balkans, Africa, the Middle East, and Central Asia. In 1992, BRS was awarded the U.S. Army's Logistics Civil Augmentation Program for preparing and detailing civilian assistance in providing logistical support for U.S. troops deployed in contingency military planning, and later that year, BRS was asked to review and update its plans. In December 1992, BRS was asked to support U.S. troops in Somalia in the wake of Operation Restore Hope. Following Somalia, BRS supported U.S. troop deployments, with increasing amounts of support in Rwanda (Operation Support Hope), Haiti (Operation Uphold Democracy), and Kuwait (Operation Vigilant Warrior). In 1995, BRS was awarded \$546 million to support U.S. soldiers deployed in the peacekeeping operations in Bosnia

and Herzegovina led by the North Atlantic Treaty Organization's Implementation Force, although their support often extended to the U.S. allies involved in the mission. Although BRS lost the Logistics Civil Augmentation Program contract in 1997 (which was won again in 2001), the operations of BRS in the Balkans continued. In 1999, as the North Atlantic Treaty Organization initiated the Kosovo campaign, KBR provided logistical support for U.S. forces as well as nongovernmental organizations, such as the Red Cross, in building and operating camps for refugees in Albania and Macedonia. Following the September 11, 2001, terrorist attacks, KBR was handed much of the logistical support and base construction work of U.S. forces in Afghanistan, Uzbekistan, and Iraq. In 2010, Vinnell-Brown & Root was awarded a \$335 million contract by the U.S. Air Force for base support operations in Turkey and Spain, in addition to its contracts in Egypt, Oman, and Saudi Arabia.

HAMAS

Hamas (an acronym for Harakat al-Muqawama al-Islamiya, or the Islamic Resistance Movement) is a Palestinian political and militant movement founded in 1987 by Sheikh Ahmed Yassin, who preached and coordinated charitable work in the West Bank and Gaza Strip through the Muslim Brotherhood movement in Egypt. Yassin, who had worked in the region for the Muslim Brotherhood since 1973, established Hamas as a local political wing of the organization following the outbreak of the first intifada in December 1987. The organization of Hamas is split among three main pursuits: (1) the political wing, (2) the military wing, and (3) a charitable and social work wing. Hamas is currently the party in

power in the Gaza Strip region of the Palestinian Authority and has been engaged in civil conflicts with the ruling Fatah party since the 2006 legislative elections in Palestine. This entry examines the history, activities, and leadership of Hamas.

Hamas departed from the nonviolent principles of the Muslim Brotherhood from its early days, and its founding charter calls for the destruction of Israel as well as the replacement of the current Palestinian Authority with an Islamist state in the West Bank and Gaza Strip. Among its stated goals are to “raise the banner of Allah over every inch of Palestine,” and it has maintained that the waging of holy war against Israel was the responsibility of every Palestinian Muslim. The militarized wing of Hamas operates as Izz ad-Din al Qassam Brigades, responsible for rocket attacks against Israel and for suicide bombings through 2008.

The first Hamas suicide bombing took place in Israel in 1993, just months before the Israeli-Palestinian peace accords at Oslo, and it is estimated that Hamas is responsible for more than 350 separate terrorist attacks since that time, the numbers of which escalated quickly following the Oslo accords. In 2009, Khaled Mashal, the current leader of Hamas, indicated his willingness to come to a settlement with Israel at 1967 borders, provided East Jerusalem would become the Palestinian capital and Palestinian refugees would be allowed to return. Hamas was excluded from peace talks for not recognizing the state of Israel. Hamas currently has about 1,000 members and thousands of supporters throughout the region and the world.

Because Hamas is the party in power in the Palestinian Authority legislative body, they have some public funds at their disposal, though much of Hamas’s budget comes from donations, particularly from private donors or sympathetic states such as Saudi Arabia and Iran. Some of Hamas’s money, somewhat controversially, also comes from the Islamic charities in the United States and Canada that donate through Hamas-backed groups. It has been estimated, however, that about 90% of Hamas’s budget is dedicated to charity work and social services within the Palestinian Authority. Hamas’s activities within the Palestinian Authority involve social and cultural welfare programs, including establishing schools, soup kitchens, mosques, and sports teams, and much of Hamas’s support comes from the group’s reputation for political

honesty and lack of corruption. The charity work has not enabled the group to enjoy consistent public support, however. In June 2011, a public opinion survey of Gazans indicated that 67% of the population would support demonstrations in favor of regime change.

In 2006, the Palestinian Authority held its first legislative elections since 1996, and after the Battle of Gaza in 2007, Hamas ousted the rival Fatah party as the ruling party in the Gaza Strip while Fatah retained control over the West Bank regions. Since that time, there has been political and military-civil conflict between the two groups, and the conflict has left the Palestinian Authority politically divided.

Despite the split between the two regions, Hamas only holds control in Gaza, and its leadership has been at odds with the leadership of Gaza’s prime minister, Ismail Haniyeh. The Fatah-affiliated president of the Palestinian Authority, Mahmoud Abbas, also the chair of the Palestine Liberation Organization, is recognized internationally as the leader of the Palestinian State. In 2011, Abbas was responsible for the bid for full Palestinian statehood at the United Nations. There have been several attempts since 2011 to reconcile the two parties in the Palestinian Authority, but these attempts have met roadblocks not only from Fatah and Hamas but also from the Israeli prime minister Benjamin Netanyahu, who opposed the reunion in 2011 as Hamas still does not recognize the state of Israel. However, the possibility of reconciliation may have increased after Abbas’s speech in favor of Palestinian statehood at the United Nations, as public opinion polls showed an increase in Abbas’s popularity, which may aid talks with Hamas going forward.

Hamas has encountered some difficulty with other former allies as well. After Khaled Mashaal, based in Damascus, refused to publicly express support for the Syrian government’s crackdown against rebels in 2011, Hamas lost support from Syria and Iran, forcing the group to relocate to Egypt and Qatar and leading to a Hamas declaration of support for the Syrian rebels. This loss of support is doubly painful for the group, as the Palestinian Authority has been locked in deep budget shortfalls and has operated under threat of being cut off from foreign aid from the United States and the European Union over the group’s refusal to renounce violence.

Currently and in the near future, the largest issues facing Hamas involve relations with the Palestine Liberation Organization and Fatah, as well as Hamas's willingness to be a part of negotiations with the Israelis, which would require the group to recognize Israel's statehood. Getting fuel to Gaza became an issue in 2012, when Hamas was unable to receive the fuel it had begun purchasing from Egypt instead of Israel, and the region's only power plant shut down. Peace talks with Fatah also stalled in 2012, leaving the future of the Hamas government in the Palestinian Authority uncertain at best. The United Nations, after a diplomatic visit in July 2012, found little hope in the economic situation in Gaza and expressed little current hope for the renewal of peace negotiations between Israel and Palestine. Hamas still faces a number of problems and questions about its militant ideology in its quest for legitimacy in Palestine.

HANSON, VICTOR DAVIS

In the decades around the turn of the 21st century, the historian, classicist, and opinion journalist Victor Davis Hanson emerged as one of the leading public

intellectuals in the United States. Born into a farming family in California's central valley in 1953, Hanson worked on the family raisin farm before and after earning a Ph.D. from Stanford University in classical Greek history in 1980. In the years since, he has authored or coauthored more than 15 books and scores of articles, book chapters, and opinion pieces. This entry discusses Hanson's writings and his views on war making.

Hanson's importance to military science comes in two areas. The first is as a scholar of the ancient world, in particular warfare in ancient Greece. The second is as a commentator on contemporary military affairs, especially in the time after September 11, 2001. Hanson's particular attribute has been to link these areas, drawing ideas from antiquity into the present day.

Hanson emerged as a leading classical scholar and military historian with *Warfare and Agriculture in Classical Greece* (1983, 1998, rev. ed.), *The Western Way of War: Infantry Battle in Ancient Greece* (1989), and *The Other Greeks* (1995), books that made groundbreaking arguments for connections between agriculture in Greece's terrain and climate and the manner in which the Greek city-states waged war. In short, Greek agriculture and individual land ownership led to a style of warfare that emphasized decisive battle according to mutually agreed-on rules of conduct. That fundamental style, with many small variations, came to dominate Western war making all the way until the present. In making his case, he used his experiences as a farmer to inform his understanding of the past. It is not surprising that for him the process also worked in reverse—he came to see clear connections from the distant past to the modern day.

Indeed, much of Hanson's early career focused on making the classical age relevant to the present. Those efforts included a number of coauthored arguments for a revival of classic studies in higher education and, more germane to this entry, for a chain of continuity in a Western way of war from antiquity to the present. For example, *Carnage and Culture* (2001) drew out the argument of *The Western Way of War*, reviewing battles between Western and non-Western forces throughout history to demonstrate the particular traits—freedom, decisive battle, mobilized citizenry, individual land ownership, reason, free markets, discipline, individualism, and self-critique—that together allowed for the rise of the West in world history. *Ripples of Battle* (2003) made the case that battles, the most intense and unforgiving of human

activities, became embedded in human society and culture through history, memory, literature, and art, all of which gave war great power as a shaper, for good and ill, of civilization.

When the present became more violent after September 11, Hanson had placed himself perfectly to comment on the current state of affairs. The first run of *Carnage and Culture* appeared in the summer of 2001, and at the same time, Hanson, a lifelong Democrat, began writing regularly for the conservative publication *National Review*. In the years since, he has been an ardent supporter of the American war effort, and a strong critic of those who oppose the war. Many of his writings in this vein have been captured in two collections, *An Autumn of War* (2002) and *Between War and Peace* (2004), and he has also been a frequent contributor to the *New York Times*, *Wall Street Journal*, *Commentary*, *Claremont Review of Books*, *New Criterion*, *Policy Review*, *Wilson Quarterly*, and *Weekly Standard*, along with giving frequent television interviews and providing a steady stream of writings on various weblogs. His direct influence on policy reached its highpoint during the presidency of George W. Bush, when he met with the president, and when Vice President Dick Cheney brought him in for a discussion of war, history, and human nature.

Hanson's views have not gone unchallenged. Although his views on the nature and dynamics of Greek warfare are generally accepted, including his later work on the Peloponnesian War, *A War Like No Other* (2005), many influential military historians have strongly disagreed with the Western way of war thesis and all of its derivatives. Most critics offer two major counters to Hanson's argument. The first is that non-Western powers have, on multiple historical occasions, decisively defeated Western forces. The Mongols offer a striking example of a non-Western way of war having no difficulty whatsoever crushing European armies in battle. The second is that they see nothing like an unbroken chain linking the Greek hoplite (soldier) to the fighting men and women of Western powers today. For example, in his book *Battle* (2004), the historian John Lynn took particular issue with what he called Hanson's "universal soldier" argument. Lynn found it highly questionable to try to link the experiences, motivations, and actions of individual soldiers across so broad an expanse of time and place as all of Western history. The resulting debate has informed and enriched the fields of military and world history.

Nor has Hanson, now a scholar at the Hoover Institution, commented on current affairs without opposition. Critics of the Global War on Terrorism have also turned their attention to Hanson from time to time, maintaining that his interpretations provide nothing more than historical justification for faulty or even criminal acts of war.

There is a certain irony to Hanson's professional career path and his success in linking scholarship and commentary. To a degree, the critiques of Hanson the scholar and Hanson the pundit have also been linked. The linkage has been largely unfortunate, because the politics of punditry tend toward a heated style of discourse that overshadows historical debate. Hanson's very success has led to a penchant among some to too readily or blithely dismiss his scholarly work. Nevertheless, whatever his specific interpretations on matters historical and contemporary, the work of Victor Davis Hanson is always informed and has been an interesting and constructive contribution to military science.

HAZING

Hazing captures the historical pages of ancient rites of passage and military tradition. The sounds and images of yelling sergeants beating their fists on the sides of buses full of new recruits serve as a form of psychological intimidation. The goal of such acts of intimidation is to gain immediate control, attention, and respect.

The ultimate purpose is to instill a sense of esprit de corps, bonding, and a military presence in recruits from diverse backgrounds and experiences. Another goal is to turn military "outsiders" into "insiders" through suffering and surviving common hardships as a team. However, fine lines exist between hazing, abuse, and torture. This entry defines hazing and discusses types and consequences of hazing.

Kicking recruits as they depart the bus on arrival for basic training clearly crosses the line and becomes physical abuse. Another common strategy is to move through the barracks in the middle of the night, banging metal garbage can covers. Blood pinning new military pilots requires piercing their chest with the sharp pins of aviator wings. Many other initiation rituals may still prevail; however, commanders do not officially condone them.

Noncommissioned officers in direct supervision of recruits walk a fine line between military tradition and hazing, which is illegal. Traditional punishments for failure to comply with military direction and orders include multiple push-ups and running in place for extended periods while the recruit holds a weapon over the his or her head. Adverse weather conditions are of no consequence. The administration of these punishments must be fair and reasonable and should not extend beyond the abilities of the recruit.

Hazing Defined

The term *hazing* is not limited to any form of initiation or “rite of passage.” According to the army, hazing involves inflicting or encouraging others to inflict physically painful activities on another member of the service. Physically striking someone is the obvious form of hazing. The more subtle forms of hazing include forcing or requiring the consumption of excessive amounts of food, alcohol, or other substances. The famous West Point case of 1898, when Cadet Oscar Booz endured constant torment, beatings, verbal ridicule, and forced consumption of hot sauce represents one example.

Hazing that includes psychological and verbal abuse may prove more harmful over time. Psychological abuse involves a substantial range of emotional abuse and is not limited to the following: (a) causes another military member to suffer; (b) exposes soldier to an activity that is cruel; (c) is abusive, humiliating, or oppressive; and (d) encourages a service member to engage in dangerous, illegal, or demeaning behaviors. Dire consequences can result when a seemingly innocent celebration or the “rite of passage” becomes the venue for bullying, abuse, or psychological torture.

In addition, abusive hazing results in harming multiple victims: (a) the abused, (b) those who do not participate but witness the abuse, and (c) the family or friends left with the aftermath of the abuse.

Military Significance

According to army regulations, hazing is prohibited in all cases, including off-duty or unofficial activities or unit functions. Hazing can occur superior to subordinate, among peers, and even directed toward senior military personnel by those of junior rank. The expressed or implied consent of the service member is not a defense to the violation of Army Regulation 600-20. The Marine Corps has a similar regulation: no marine may engage in hazing or consent to acts of hazing (Marine Corps Order 1700.28). Military hazing defies definition because of the constant innovations and variations the human mind can contrive.

Military Law

Some drill instructors may believe that tearing recruits down psychologically and physically enables them to put the recruit back together into a preferred military personality. New recruits are humiliated so that basic training staff can restructure their personalities into disciplined combatants. These noncommissioned officers instruct the military behaviors and concepts that are necessary to succeed in battle. Occasionally, these behaviors will place military personnel in conflict with the Uniform Code of Military Justice.

Some hazing rituals are malicious and involve beating, kicking, and traumatic injuries that may lead to death. Historical evidence exists for burning, branding, mutilating, and sexual abuse. The most frequently administered behaviors are excessive drill calisthenics that may result in death. These forms of hazing will likely result in military imprisonment and possible dishonorable discharge from military service for the offender.

Commanders are responsible for every hazing occurrence in their command, even if they were not present. The defense of not having any knowledge of the incident will not prevail; commanders cannot abdicate their command responsibilities. These officers can receive adverse officer evaluation reports and be relieved of command, which means the end of their careers.

If military officers participate in the hazing conspiracy, they are subject to military prosecution under the authority of the Uniform Code of Military Justice. If the commander or officer gave an order (direct or implied) or participated in the

hazing death of military member, that commander or officer is legally culpable. In the cases of negligent or reckless deaths, long prison sentences and harsh penalties might prevail.

Hazing Consequences

Hazing is supposed to inculcate military values, test recruits under stressful situations, and mimic hostile environments. The goal is to eliminate recruits who cannot perform under stressful combat conditions. The rationale is that the elimination of weaker recruits will ultimately save lives in battle. Hazing opponents suggest that this philosophy produces the opposite results in life-threatening combat scenarios.

Opponents cite instances regarding the Russian army in Chechnya. Russian units that reported the highest tradition of hazing were the first to break ranks and flee under enemy fire. Instructors who explain the underlying foundation for military tactics can achieve the service members' rational compliance and superior training objectives. Blind obedience and hazing are inferior training strategies.

Brutal hazing does not support the rationale for building group solidarity and may serve a destructive purpose. The possibility of negative and unintended consequences may unfold in real combat scenarios. The negative consequences from hazing that unfold from the in-group, rather than from the enemy (out-group), engender hostility, suspicion, and distrust of commanders, leaders, and fellow combatants.

Certainly, the worst of hazing has adverse psychological consequences that may lead to adverse combat performance and dysfunctional behaviors. Hazing activities that lead to physical injuries, like brain or organ damage and sexual abuse, can never be justified. Some opponents have suggested that hazing may eventually lead to *fragging*, the deliberate release of a grenade near military leaders. The outcome of the activity is to vent hostility and injure or incapacitate the targeted leader.

Psychological trauma related to abusive hazing is more difficult to assess. Adverse stress reactions and trauma vary among individuals, which may include depression and posttraumatic stress disorder. Those individuals who experience traumatic stress prior to combat are more likely to experience posttraumatic stress disorder. Traumatic episodes are cumulative; more stress and trauma from those who are

trusted remain particularly harmful. Bullying and abuse from respected leaders are especially toxic. The psychological harm to military personnel is immeasurable.

Conclusion

Military leadership seeks to instill esprit de corps and build respect for the accomplishments of air force, army, Coast Guard, marine, and navy personnel. Military hazing "rites of passage" can be dangerous and life threatening. Sadistic bullying and abusive behaviors should receive a zero-tolerance approach from commanders and military leaders. Unharnessed hazing is counterproductive to achieving military core values, may alienate service members, and destroy unit cohesion and bonding.

HELICOPTERS

Helicopters are a type of aircraft that generate lift using a horizontal propeller, unlike the vertical propellers of airplanes. Using a secondary propeller to keep the aircraft from losing control due to the massive torque created by the force of the main propeller, helicopters are capable of hovering and executing delicate maneuvers that modern jet fighters are unable to do. Helicopters have been developed to serve two main roles. The helicopter's initial, and primary, role was as a transport for ferrying troops or equipment to the front lines or evacuating them as necessary. Its second role is as a weapons platform for the support of units deployed in the

field. The helicopter's inherent maneuverability and its ability to hover for sustained periods allow it to provide sustained and accurate fire on enemies, at ranges closer than that at which an attack aircraft could safely deploy ordnance. This entry describes the types and characteristics of helicopters in use today by armed forces, focusing on the U.S. military.

Early History

Much like the Wright brothers, early inventors had to deal with a number of engineering issues to create an efficient model. Issues arose from attempting to generate sufficient lift with different models of propellers, dealing with the vibrations created by the motor as well as the operation of the helicopter. Patience and perseverance by Igor Sikorsky, a notable aircraft inventor who shifted his focus toward helicopters, led to the VS-300A, known as the R-4 Hoverfly, the first helicopter. It saw very limited service during World War II as a rescue helicopter, transporting wounded away from the battlefield. Following the war, a number of other models were developed, with the intent of transforming the transportation market by providing helicopters that were less expensive and simpler than the family sedan. To this end, the Bell Helicopter Model 47 became the first helicopter for the civilian market. Its military variants would see service in the Korean War and later during the Vietnam War.

Transport Helicopters

The idea of using helicopters as a means of transportation arose from the difficulty experienced by the world's armies in surmounting the terrain. Even for the world's most modern militaries, terrain provides obstacles that could delay an offensive or provide the enemy the chance for a withering counterattack. Given the fact that helicopters do not need a long runway for takeoff and landing, they are able to transport soldiers and materiel to almost any location in an area of operations. Though planes were used in the past to deploy paratroopers in large numbers behind enemy lines, helicopters were able to place the soldiers exactly where they were needed and offered the option of quick extraction or evacuation if necessary.

Transport helicopters were first widely used during the Korean War, initially for reconnaissance, medical evacuation, and rescue missions. However,

the helicopter was soon found to be very flexible. Marine helicopters were used for target spotting for artillery, as well as for the use of special operations teams. Snipers used helicopters as mobile platforms to limit Korean infiltration of allied lines.

The ability to deploy soldiers rapidly would later be used to great effect by the British in their campaign to retain control of Malaysia. Controlling an area of 50,000 square miles made the helicopter's use a necessity. Similarly, the French used the helicopter during their Indochina campaign. In response to the Vietnamese rebels encircling and ambushing long convoys, transport helicopters were positioned in such a way as to encircle the rebels and then strike at them from both sides.

America's entry in the Vietnam conflict saw the use of similar techniques for transport aircraft as in the previous conflicts, but on a greater scale. Every year that the Vietnam War continued saw the need for greater numbers of transport helicopters. At the same time, it was quickly realized that transport helicopters were not immune to ground fire. The Battle of Ap Bac, in 1963, saw the deployment of 15 helicopters. Five were shot down and only one returned without battle damage. During the weeklong Battle of Ia Drang in 1965, transport helicopters deployed and redeployed battalions, repositioned artillery to provide improved support angles, and airlifted supplies to the soldiers. Thanks to the logistical support of transport helicopters, Ia Drang saw the defeat of three regiments of the North Vietnamese army. This battle led to the Jitterbug battle tactic, where helicopters would identify enemy sites, mass forces to create a cordon around the area, and then assault the enemy with airborne ordnance and a ground sweep. This tactic was effective if the army units had the mobility that helicopters provided and the large number of troops necessary for an effective cordon of an area. This tactic continues to the present day but is rarely used for conventional operations. Most modern helicopter operations involve the deployment or retrieval of special operations forces.

Transport helicopters were also used to recover downed pilots. Sparing them from death or an extended captivity at the hands of the North Vietnamese, recovery missions also provided soldiers a valuable morale boost. However, the enemy quickly adapted to these missions and prepared ambushes instead of capturing pilots. These missions continue to the present day, with Quick Response

Forces always at the ready to respond to the downing of an aircraft or helicopter.

Throughout Vietnam, the standard transport helicopter for the U.S. Army was the UH-1 Iroquois, colloquially known as the “Huey.” Though initially underpowered, its performance and carrying capacity would improve with the later D and the H models. The Huey’s versatility and toughness remain legendary, though the helicopter was rather loud. The Huey would be used in concert with aircraft and attack helicopters to suppress the enemy and allow the vulnerable helicopters the time needed to complete their mission and return to base. The Huey remains in service, with the most recent model, the UH-1Y Venom, entering service in 2004.

The CH-47 Chinook was the second major transport helicopter used during the Vietnam War. Using two counterrotating rotors resolved the need for a tail rotor, allowing the helicopter to direct its power toward lift and thrust. The Chinook was designed as a heavy transport helicopter, delivering significantly heavier loads to the field. Its focus was thus shifted toward the deployment of heavy artillery pieces or the evacuation of large numbers of wounded soldiers, leaving the Huey with the role of troop transport. In addition, Chinooks were also used in emergency evacuations of bases in the latter years of the conflict, as the American forces steadily scaled back their presence. The Chinook, like the Huey, would be steadily modernized and still sees service to this day.

Following Vietnam, the U.S. Army developed the UH-60 Black Hawk with the intent of replacing the Huey as the primary transport helicopter. The Black Hawk was designed with survivability in mind. Armored against small arms fire, the aircraft is also equipped with redundancies to prevent mechanical failures and is designed to crush progressively to safeguard passengers. Black Hawks are capable of moving up to 11 armed soldiers or an artillery piece with its operators and ammunition. In addition to this air assault role, Black Hawks also provide emergency medical evacuation services and have been modified for command purposes and for electronic warfare. Specially modified versions of the Black Hawk were used in the May 2, 2011, operation to eliminate the al Qaeda leader Osama bin Laden. Using technology and material from the F-117 stealth bomber, these specially designed Black Hawks featured modifications including an angular body to prevent radar detection and more rotors to lower the sound of the engines. These modifications allowed the helicopters to move in undetected, though the crash of one of the helicopters led to the unveiling of some of the stealth technology.

The Soviet Union, unlike the American army, initially amalgamated the transport and attack helicopters in a single vehicle. The Mi-8 is a multipurpose helicopter, significantly larger and heavier than the American counterpart, the Huey. The transport variant of the Mi-8 can contain up to 30 soldiers, while

U.S. Army UH-60 Black Hawk helicopters land in Paktika Province, Afghanistan, January 24, 2011.

Source: U.S. Army photo by Specialist Zachary Burke (released).

the attack version of the aircraft has machine guns and six external hardpoints to allow for the storage of rockets and guided missiles. The successor to the Mi-8 was the Mi-24 Hind. This variant favored the attack role, with a smaller cargo region allowing a maximum of eight soldiers. The Hind is also armed with either a 12.7-millimeter machine gun or 30-millimeter cannon with four hardpoints that allow it to carry antitank missiles, rockets, grenade launchers, or extra fuel tanks. Both helicopters saw use in the Soviet Campaign in Afghanistan from 1979 to 1989, where they were used against the unconventional mujahideen. The helicopters were effective during this campaign, though casualties mounted when the mujahideen were armed with modern antiair weaponry and 12.7-millimeter antiaircraft guns.

Attack Helicopters

The realization that transport helicopters were not invulnerable and provided tempting targets to enemy antiaircraft gunners led to calls for the installation of weaponry to suppress enemy fire and allow the transports to deploy the soldiers more effectively. The French were the first to field attack helicopters during their campaign in Algeria. Armed with machine guns, rockets, and, eventually, guided missiles, attack helicopters would strafe the target zone a number of times to suppress enemy fire before the transports would arrive to deploy soldiers.

The first American attack helicopter was an armed form of the UH-1 Iroquois. However, the drag that resulted from arming the helicopter significantly slowed it down, limiting its use in combat operations. The AH-1 Cobra, its replacement, was thus designed specifically for the role of bearing weaponry. Based on the Iroquois design, the Cobra had the gunner sitting behind the pilot, allowing for the fuselage to be thinned greatly. The Cobra sacrificed all other possible functions for the attack role and was armed with Gatling guns, rocket pods, and automatic grenade launchers. Gunships were able to target enemy positions in the sides of narrow valleys where fixed-wing aircraft were unable to operate. The development of the tube-launched, optically tracked, wire-guided missile (also known as TOW missile) allowed attack helicopters to target heavy armor. Cobras remain in service today in various models. The most recent model, the AH-1Z Viper,

is designed to incorporate modern electronic technology, including night vision technology, to allow the helicopter to continue operating into the 21st century.

Operation Desert Storm saw the deployment of the AH-64 Apache, an improvement on the Cobra design. Armed with a 30-millimeter cannon, the Apache has four hardpoints for rockets or helicopter-launched fire-and-forget missiles. Its primary role as an attack helicopter was that of destroying conventional enemy forces. Using night vision technology, Apaches were able to destroy targets as far as 4 miles away with their missiles, often without the enemy being able to launch a counterattack.

Apaches would also see action in Operation Enduring Freedom in Afghanistan. By this stage, a number of Apaches had been upgraded to the AH-64D Longbow design, incorporating new digital technology allowing the aircraft access to a secure data link and a comprehensive view of the battlefield. Operation Enduring Freedom saw the Apache deployed to an unconventional war similar to Vietnam. During Operation Anaconda, an assault on enemy positions in the Shah-i-Kot Valley, Apaches assumed a number of roles, from reconnaissance to direct attack and designating targets for forward artillery positions. They provided close air support for the troops on the ground and eliminated enemy mortar positions. Given the lack of armored targets in Afghanistan, the load-out was adapted to favor rockets and extra fuel tanks in the place of helicopter-launched fire-and-forget missiles, providing increased mobility and ammunition for lighter targets.

Operation Iraqi Freedom began as a conventional war, with Apaches deployed against enemy armor, destroying tanks and armored personnel carriers as well as lighter targets such as technicals, trucks armed with a heavy machine gun. The Iraqis had adapted to helicopters during the previous war, hiding weapons behind tree lines and palm canopies and within urban areas. Tanks were provided as bait, with plain-clothes units hidden in ambush points. In response to these developments, Apaches adapted to close-combat missions, firing on targets while moving to provide a more difficult target. After the defeat of the conventional forces, Apaches adopted a role similar to that in Afghanistan, providing a screening force ahead of the main body of ground forces as well as support fire once the enemy

was engaged. Apaches are often deployed using aerial reconnaissance drones to target insurgents laying ambushes or improvised explosive devices on roads. Despite claims that attack aircraft are better able to provide close air support for allied forces, helicopters are able to provide effective support fire at ranges less than those of aircraft. At the same time, attack helicopters are capable of providing more surgical supporting fire than planes. Apaches were used regularly to destroy enemy snipers who targeted the green zone in Baghdad. The use of attack aircraft against smaller targets is not possible as their weaponry is too large and destructive for such surgical strikes.

The Cobra and Apache have served on the front lines for almost 50 and 30 years, respectively. This has been possible with constant updates and upgrades to keep the machinery technologically modern. Though the U.S. Army did look into the possibility of deploying a new stealth helicopter, the RAH-66 Comanche, high development costs and the limited use of such specialized equipment led to the scrapping of the project in 2004.

In the past decade, Russia has also begun fielding specialized attack helicopters. Of the many variations, the Mi-28A Havoc is the most numerous. Similar in appearance to the Apache, the Havoc is designed specifically as an attack helicopter and has no transport capabilities. The crew cabin is heavily armored, and the windshield is designed

to withstand 12.7-millimeter antiaircraft fire. Four hardpoints on the wings allow a vast array of weaponry. The night version of the Havoc, the Mi-28N, incorporates an improved electronic combat system and night vision technology to allow the helicopter to operate at night.

HELMETS

A helmet is a type of military headgear designed to protect the wearer's head in combat. Helmets are among the oldest forms of personal protective armor. Most contemporary militaries utilize Kevlar and other composites to create light but strong head protection for combatants. This entry discusses the development of helmets and looks at helmets in use today.

Archaeological evidence has revealed that, as early as the third millennium BCE, Sumerian, Babylonian, and Assyrian warriors wore primitive helmets made of rawhide, bone, and/or copper into battle. By the mid-23rd century BCE, helmets constructed out of such primitive material began to fall out of use, in favor of ones made of bronze. The refinement of iron smelting in the 9th century BCE brought about the end of dominance of bronze helmets on the battlefield and ushered in the era of iron helmets. The era of iron lasted but a fleeting moment, for by 950 CE, steel helmets were king. In the mid-17th century, the use of helmets in battle declined rapidly because of the proliferation of accurate black powdered firearms. By the 18th century, the appearance of helmets on the battlefield all but vanished, except for the occasional uses as elaborate, purely decorative, headwear. After being relegated as decorative headgear for more than 200 years, the hazards of World War I necessitated the reappearance of functional helmets on the battlefield.

The battlefields of World War I were unlike anything seen before. The sheer amount of carnage and death caused the various nations at war to look for ways to protect their troops. One of the main problems that needed addressing was how to protect a soldier's head from projectiles, such as shrapnel and small arms fire. The most obvious answer to this problem was to develop some sort of helmet. French General Louis Adrian was the first to come up with the idea for a mass-produced steel combat helmet. It is said that General Adrian came up with the idea after a chance encounter with a wounded soldier. The story goes that on seeing a soldier with a head wound, General Adrian inquired how he survived. The soldier replied that he owed his life to a metal bowl he was wearing under his cap to help protect his head. From this inquiry and increasing field reports of head wounds, Adrian set to work on creating what would turn out to be the first modern combat helmet. Soon after France began fielding the

Adrian helmet in 1915, the other belligerent nations followed suit.

World War I helmets such as France's Adrian helmet, Britain's Jeane Kirkpatrick, and Germany's M-16 helmet were not designed to stop bullets but rather to protect the wearer from shrapnel and deflect small arms fire. The idea behind them was to keep the wearer alive, though not necessarily unwounded, while at the same time allowing the helmet to be as light and comfortable as possible. Reports after the war confirmed that such helmets significantly reduced the number of head wounds and the mortalities from them.

After World War I, the modern combat helmet continued to evolve. By World War II, nearly all industrial nations had adopted some sort of combat helmet for use by their armed forces. America adopted the iconic M-1 in 1941, Germany the notorious M-35 in 1935, and Britain the Mk III "turtle" helmet in 1944. While these helmets offered superior protection to their World War I counterparts—thanks to improved designs, thicker walls, and harder steel—their ability to protect the wearer's head was limited by the fact that steel is a fairly heavy material. The thicker the steel, the more protection it could offer, yet that added protection resulted in added weight. While it would have been easy for any nation to create a steel helmet capable of stopping even the largest of rifle rounds, the weight of such a helmet would make it completely impractical to wear. Because of this, most nations continued to issue combat helmets based on World War II designs well into the 1980s.

In 1983, after it was in service for more than 41 years, the U.S. military began phasing out the M-1 combat helmet in favor of the Personnel Armor System for Ground Troops helmet, which completely revolutionized the modern military helmet. This helmet was like no combat helmet before it, pioneering the use of lightweight Kevlar. Kevlar allowed the U.S. military to field a helmet that was superior to its steel counterparts in nearly every way. Realizing the advantages of space-age materials like Kevlar and ballistic nylon, by 2011 most developed nations abandoned the use of steel helmets.

Currently, the United States and other developed nations are in the process of developing combat helmets not only with superior ballistic protection but also with the ability to protect the user's head from blunt force trauma and concussive waves caused by explosions. While helmet designers have been aware of the importance of incorporating blunt

force trauma and concussive wave protection into their designs, only recently have militaries decided that a helmet's ability to protect a soldier from such forces is just as important as its ability to protect a soldier from shrapnel and projectiles. This change of attitude is a direct result of the high number of cases of traumatic brain injury suffered by coalition forces in Afghanistan and Iraq, the majority of which were caused by improvised explosive devices. Some of the proposed design features that may be seen in the next generation of combat helmets are integrated face shields and/or neck braces.

relation of events on the battlefield. In this particular pursuit, the historian searches for details adequate to an accurate accounting of events compressed into a very narrow timeline. As one author put it, “At the centre of the history of war there must lie the study of military history—that is, the study of the central activity of the armed forces, that is, *fighting*” (Moyar, 2007, p. 226).

Commanders and armies are quite naturally the most important actors in military history. Foot soldiers provide the muscle for maneuver and combat. Their officers supply the intellect behind grand strategy and battlefield tactics. The interaction of these two groups, in combination with military technology, terrain, and the other circumstances surrounding conflict, provide the basis for a large body of military history.

Military history of this type essentially treats its subject as a science, an empirical exercise in logistics, weaponry, tactics, and command. In the past, military historians have studied war in terms of the geometry of lines and columns or the physics of artillery trajectories. When Theodore Roosevelt published *The Naval War of 1812* (1882), he applied his era's profound faith in rationalism to describe the most decisive elements of human conflict.

A separate school of thought treats military history more as an art than as a science. Authors like Carl von Clausewitz, who described war as “the business of the people,” invest their analysis in intangible factors like the “will” to win or the ability to act with decisiveness in the heat of battle. War from this point of view is unpredictable, the outcome of battle resting on the precarious foundation of human nature. In the late 20th century, academics like John Keegan pursued what would be called the “new military history”—an approach that incorporated the broader topics of society and culture into the study of war.

Despite the apparent division of methods, it is important to understand that empirical and non-empirical approaches to military history are not mutually exclusive. Any good institutional history will reveal a distinct “culture” residing within the individual units or branches of the armed services of any country. A number of authors, Rick Atkinson being prominent among them, have found effective ways to reconcile the science of war with its more human qualities. This entry examines works of military history by authors from antiquity to the present.

HISTORY, MILITARY: APPROACHES TO

For centuries, military history has had a simple purpose. In its most basic form, it is an exercise in description. Military history is a chronicle, a detailed

Military History in Antiquity

The origins of the Western tradition of military history are in Greece. In the works of Thucydides and Herodotus, the reader may find the first systematic approaches to the subject of war. For his own part, Herodotus engages both the tangible and intangible features of the Persian Wars. His history provides an exhaustive examination of the host marshaled by Xerxes to invade Greece. He offers a detailed catalog of the weapons, armor, and individual appearance of the forces assembled from the many nations that made up the Persian Empire of the time. Conversely, Herodotus also indulges in relating the lengthy discourse among the Persian leadership that reportedly presaged the invasion. The focus here is the warnings and omens presented to Xerxes regarding his plan and his unwillingness to heed them.

Thucydides's *History of the Peloponnesian War* pursues military history from a different tack. His work is informed in part by a more traditional approach to military operations. Thucydides questions Homer's account of the invasion fleet that sailed against Troy by breaking down the exact numbers of soldiers and crew inhabiting each ship. However, what guides most of his narrative is the political interaction between the Greek city-states. From this perspective, campaigns and tactical accomplishments are incidental to the overall story. What matters most are the dynamics surrounding the leaders embroiled in conflict.

Military historians of ancient Rome followed methods similar to their Greek predecessors. Tacitus, for example, provides a complex mixture of the greater political events and strategic considerations that surrounded the military campaigns of his era. His narrative includes Tiberius's concerns regarding the placement of his legions as well as their political loyalty to the empire. Yet he is also able to impart the viciousness of Rome's campaigns against the German tribes and the tenuous nature of its fight amid the trackless swamps and forests of Rome's northern European frontier. His operational history is embellished by an eye for detail: night movement made bright by starlight, the particular placement of legions on the march and in line of battle, or the scene that the Roman army found on discovering Varus's slaughtered legions.

The work of Vegetius provides a fascinating example of history as a useful, practical tool, but

with some of the inherent limits that often encumber academe. On its face, his *Epitome of Military Science*, written in the latter days of the empire, offers a practical guide to Roman recruitment, training, and other military practices, drawing specifically from the "ancient" times or early days of the empire. In its precision, the reader draws confidence from Vegetius's assertion that proper training and discipline are paramount in constructing an effective military force. In fact, European military affairs after the fall of Rome were heavily influenced by this basic assumption.

However, the *Epitome* is also a product of its times. Missing is adequate attention to siege warfare or naval affairs, which lacked importance at a point where Rome battled nomadic barbarians. Also implicit in Vegetius's writing is his chauvinism, specifically with respect to the superiority of true Romans against the foreign cultures that lay outside the empire. Regardless, because it joins Rome's formidable military traditions and the influences that defined the later empire, the *Epitome* is an important bridge between the greatness of antiquity and what followed soon afterward.

Military History and the Middle Ages

Military history during the Middle Ages reflected the period in which it was written, when much of European intellectual pursuits were defined by decline and derivation. When Einhard wrote the biography of Charlemagne, he borrowed heavily from Suetonius's *Lives of the Caesars*. It is also clear that Einhard's (1960) goal was less to offer a balanced account of European wars than to illustrate his primary subject's greatness:

Such are the wars, most skillfully planned and successfully fought, which the most powerful king waged during the forty-seven years of his reign. He so largely increased the Frank kingdom, which was already great and strong when he received it at his father's hands, that more than double of its former territory was added to it. (p. 40)

In the *Song of Roland*, the reader finds a new influence on Western military history, that of the church. The 12th-century account of war between Frankish knights and Christian Basques is meant as a chronicle of events. However, in the description of Roland's death, a more important purpose becomes apparent:

Ay-Roland knew that death was near. He lay
 On a high hill looking toward Paynim Spain,
 And beat his breast, crying "Forgive, O God,
 The wrongs that I have wrought Thee,
 since the day
 When I was born unto this day when here
 I am foredone." He raised his iron glove
 To the blue sky, and so the angels came
 On wings of gold to take his soul to God.

However, even when inspired by faith, military history during the Middle Ages could also be straightforward. In the histories that recorded the Christian crusades, one may find a more literal approach to events that includes key actors and the actions of European armies converging on the Holy Land. In *Memoirs or Chronicle of the Fourth Crusade and the Conquest of Constantinople*, Geoffrey de Villehardouin describes the conquest of Constantinople in 1204 after crusaders entered the city: "Then followed a scene of massacre and pillage: on every hand the Greeks were cut down, their horses, palfreys, mules, and other possessions snatched as booty."

In sum, the writers who addressed European military affairs offered a useful, albeit limited glimpse of their times. Viewed through the lens of devotion to secular or religious grandeur, history lost the broader worldview so typical of antiquity. As Europe approached the Renaissance and the Enlightenment, it regained this perspective, and military history would take another step forward.

Modern Approaches to Military History

When European conventional wisdom began to gravitate toward science and "systematized common sense," to use David Hume's phrase, it returned military history to the scope and scale of the classical age. Edward Gibbon's *Decline and Fall of the Roman Empire* is perhaps the most famous example of military history produced during the great Age of Reason. Gibbon's penchant for detail is evident from the very start of his work as he describes the organization of Roman legions, their weaponry, equipment, separate service branches, and a host of other information. In another important sense, his work is also a tribute to Greek and Roman methodology. As was the case with historians of antiquity, Gibbon pays scant attention to the tactical parts of

Rome's many military campaigns. In their place, he focuses on the importance of civil-military relations to Roman politics. His account of the conspiracies hatched within the Praetorian Guard against a succession of Roman emperors illustrates the importance of this core group to the empire's stability.

However, writers of this age were not content to simply construct a better means to recount the past. They also saw history as a device through which a rational actor could apply previous instances of success or failure to learn and progress. This was clearly the case with respect to understanding the science of war. In the restored writings of Tacitus and Vegetius, European military leaders sought a form of human-made precision that would create victory on the battlefield.

In this vein, Antoine-Henri de Jomini's *The Art of War* is an exercise in categorization. Throughout his landmark work, the author attempts to delineate both the broad purposes of war and its specific functions. De Jomini not only lends his analysis to diplomacy and grand strategy but also attends to the minutiae of lines and columns on the field of battle. His work is ambitious in its purview but reflects his time's confidence in the cumulative value of reason.

Carl von Clausewitz's *On War*, first published in 1832, is similar to de Jomini in that it attempts to glean practical examples from military history. His goal was to provide guidance on the many facets that constitute modern war: from specific tactical actions that govern specific battles to the strategic objectives of war itself. To accomplish this, Clausewitz borrowed liberally from 18th- and early-19th-century European wars to provide case studies for his guiding principles.

It is important to understand that neither Clausewitz nor de Jomini treated the practice of war as a pure science. Both men were representative of a school of thought known as "Military Romanticism" that appeared at the start of the 19th century. While they acknowledged the validity of reason and the applied lessons of history to war, both authors were far less sure than previous thinkers about the predictability of conflict. Consequently, in *The Art of War*, de Jomini painstakingly constructs classifications for the types of wars fought but recognizes that subjective, irrational factors sometimes win the day. Regarding "Offensive Wars to Reclaim Rights," he admits that "in wars of this nature no rules can be laid down." For his own part, Clausewitz believed

in the psychological momentum created by successful military engagements, citing Frederick the Great's victory at the Battle of Soor in 1745.

The study of war existed between the two poles of science and romanticism for much of the 19th century. However, as the period drew to a close, the imperatives of the industrial age gave greater suasion to the science of war. New generations of European and American officers looked again to reason to improve their vocations. Contemporary military history reflected this emphasis. In their search for authenticity, writers again gravitated to leaders, armies, and the nuts and bolts of operational military history. Many were inspired by the empirical approach adopted by the German historian Leopold von Ranke, which emphasized observable evidence as the foundation of historical analysis. Military affairs, dependent as they were on measurable events, from the physics of weaponry to the linear geometry of the battles themselves, seemed ideally suited to this new school of thought.

Militaries of the 19th century reinforced this utilitarian approach to history by incorporating it into advanced curriculum designed to train senior officers and their staffs. Helmuth von Moltke, who served as Chief of the German General Staff from 1857 to 1888, used the study of past campaigns to prepare his leadership for contemporary war. Germany's battlefield victories in 1866 and 1870 vindicated von Moltke's approach and encouraged other modern industrialized nations to copy his methodology. As it contemplated the need for a more potent military at the end of the century, the United States joined this group with the creation of the Naval War College (1884) and the Army War College (1901).

Although World War I shattered faith in the progressive value of science and industry, military history kept up its own momentum in the doldrums between the two World Wars. The works of J. F. C. Fuller and B. H. Liddell Hart were dedicated to addressing the tragic failures of the Great War, but with methods familiar to the past. Fuller's *The Foundation of the Science of War* (1926) was a collection of lectures at the British Staff College that interspersed operational theory with historical examples drawn from 2,000 years of Western history.

Perhaps because of popular disinterest, military history declined in public importance between the two World Wars, possibly reflecting the public's revulsion against the horror on the Western Front

from 1914 to 1918. By the 1930s, some scholars openly questioned whether or not military history could be considered an academic field given the overall decline in interest. In the United States, one effort to combat this trend was the creation of the American Military History Foundation in 1933.

World War II had a significant impact on the study of military history throughout the Western world. The enormity of the event and the qualitative changes that it introduced to the practice of war produced an array of subjects ripe for academic study. There was a ready audience for such work. The millions of veterans produced by the war entered civilian life with fresh memories and an ongoing curiosity about a conflict that had transformed their lives. In many cases, former servicemen with access to advanced degrees, as was the case with the G.I. Bill in America, readily joined the ranks of postwar historians to make their own contributions to the discourse. In the United States, many of these authors worked for the government, which directly subsidized the study of history for the sake of professional development within the military and the national security community.

Even as military history grew in popularity, academic debates emerged as to its methodology and purpose. While the more traditional focus on leaders and operational history continued to be strong elements of historical study, by the 1960s a number of scholars in the field began transitioning to what they labeled the "new" military history. This school argued that social and cultural factors had a direct bearing on the practice of war. When John Keegan examined British participation at Agincourt, Waterloo, and the Somme in *The Face of Battle*, he took the perspective of the men on the field to find realism. Still later, John Dower introduced the element of race into the Pacific campaigns of World War II in his 1986 study *War Without Mercy*.

Current trends in military history reflect a combination of new and traditional techniques. The discipline retains a focus on the empirical elements of combat. Of particular interest has been the rapid succession of breakthroughs in military technology. However, many authors have also been able to incorporate the more human elements of the story without diverging too far into historical biography. Perhaps the best examples of this combination are Rick Atkinson's and Max Hasting's recent histories of World War II.

Other historians have successfully taken the concept of a “new” military history one step further by addressing the finite particularities of gender, culture, and identity. In Carole Reardon’s *Pickett’s Charge in History and Memory* (1997), the author moves beyond the clash of arms that occurred at Gettysburg in 1863 and includes the evolving retelling of a battle that took on an epic character for the American South and the nation as a whole. Reardon notes that Pickett’s division ceased to be an agglomeration of men after their defeat at Gettysburg. Instead, they became symbols of the South’s “Lost Cause” that redrew the event for generations of Americans. In Emily Rosenberg’s *A Date Which Will Live* (2003), the author picks up Reardon’s thread by addressing Pearl Harbor not simply as an event measurable by order of battle but also by its broader—and evolving—meaning to a society that was not present to witness the disaster firsthand. Reardon and Rosenberg both point to a quality recognized by authors such as Clausewitz that historical accuracy and historical interpretation are two malleable and evolving sides of the same academic coin.

Conclusions

Military history clearly has evolved to the point where it enjoys the same relevance as other subfields in the discipline. In part, this is because the current wars against terrorism and insurgency have engendered greater attention to military studies in general. As one author noted with respect to modern military affairs: “Fitness for purpose is a crucial concept when judging the applicability of weaponry, but such fitness is frequently misunderstood by putting stress on the capacity for employing force, rather than the ends that are sought” (Black, 2004, p. 1224). The cohort of officers emerging after the September 11, 2001, attacks, perhaps best represented by General David Petraeus but also including H. R. McMaster and David Kilcullen, embraced academe as a means to understand and circumvent threats to the United States. In cases where lives literally hang in the balance, history, anthropology, linguistics, and a host of other disciplines have become part of the conventional portfolio of modern military operations. Specialists in these fields commonly accompany maneuver units in Iraq and Afghanistan, departing for good the safety of the ivory tower. The extent to which the American military has adopted nonvio-

lent (i.e., “nonkinetic”) tactics is a testament to their institutional influence.

Military historians have also earned their relevance through the inclusive and rigorous methodologies they apply to the discipline. A field dominated by its traditional focus on leaders and battles now regularly incorporates elements of the “new” military history. These features, whether applied by contemporary scholars such as Reardon or old standard bearers like Stephen E. Ambrose, make military history the viable, popular field that it is today.

HISTORY, NAVAL: APPROACHES TO

American naval history remains a popular subject for authors hailing from a variety of backgrounds. At the start of the 21st century, this trend shows little evidence of decay. This entry examines classic interpretations of the history of the U.S. Navy as well as works completed since the end of the Cold War.

Classic Interpretations

Perhaps the most well-known military theorist in American history was Alfred Thayer Mahan. Mahan, a naval officer who served in the Civil War, believed that the study of history could be used to understand the nature of naval warfare and could prescribe effective patterns of operations for contemporary navies. *The Influence of Sea Power Upon History, 1660–1783* (1890) catapulted Mahan into international recognition for his views on sea power and national strength. Through an examination of various naval conflicts between western European states, Mahan argued that sea power was an essential component of nations aspiring to great power status. He stressed the importance of seaborne commerce for economic development, particularly for the growing industrial and economic strength of the United States. To protect and defend these sea lines of communication, the United States needed a navy composed of large, modern warships trained and equipped for operations against a force of similar composition. This perspective was not the traditional role of the U.S. Navy, which, in the late 19th century, was built to prevent raids on American merchants by pirates or other small naval powers.

Mahan held that the proper role for a navy was to secure command of the sea by engaging and defeating the main fleet of the enemy in a decisive action as quickly as possible on the outbreak of war. In pursuit of this goal, Mahan argued for new naval construction as well as the expansion of overseas American possessions to provide bases. These colonies would increase the operating range of the U.S. Navy, enhancing its reach and strength, while simultaneously expanding the American economy. Over time, Mahan's views were gradually reduced in naval circles to an emphasis on a large, modern navy with less emphasis placed on the underlying foundation of a vibrant seaborne trade.

The second historian to have an enduring impact on the U.S. Navy's understanding of its own history was E. B. Potter. Dr. Potter lectured for many years at the United States Naval Academy and in conjunction with Admiral Chester Nimitz wrote *Sea Power: A Naval History* (1960). *Sea Power* served for many years as the standard textbook on naval history at the academy. The book emphasized the navy's World War II experience, highlighting the role of naval leadership, command of the sea, amphibious operation, and the influence of technological development on naval combat.

Recent Works

In the years since the end of the Cold War, works on American naval history continue to give unequal attention to different sections of the navy's history. World War II remains the most popular subject, in part due to the abundance of documentation available on the navy's role in that conflict. Civil War naval history has received a breath of new life as scholars examine the war's last underexplored subjects. The navy's experience between the two World Wars and during the early Cold War has become fruitful terrain for naval historians.

Surveys and Other Broad Works

Robert Love's two-volume *History of the U.S. Navy* (1992) provides the most in-depth coverage of the broad sweep of American naval history. Love contends that utilitarianism is the one constant in U.S. naval history, casting naval officers as pragmatic above all else. Love also highlights the role of the navy, particularly in the 19th century, in setting and executing American foreign policy. George Baer's

One Hundred Years of Sea Power: The U.S. Navy, 1890–1990 (1994) covers the navy's 20th-century experience in a single volume. Baer argues that naval strategy must be guided by national policy as set by American political leaders. The navy should never become detached from government policy, though this can be difficult when national policy is unclear, which Baer argues was the case for much of the century. Baer divides the century in two. Prior to 1945, the U.S. Navy sought a single, decisive engagement with its opponent, whereas power projection dominated American naval thinking during the Cold War. With regard to the Cold War era, Baer is critical of the naval aviation community's opposition to a balanced fleet in which aircraft carriers played a leading role, as opposed to the leading role. Kenneth Hagan's *This People's Navy: The Making of American Sea Power* (1991) covers the entire history of the U.S. Navy from a critical, New Left perspective. Hagan sees constant competition between those supporting smaller, less costly ships built for commerce protection and raiding and those supporting larger fleets built for an offensive sea control mission. As a result, Hagan prefers the 18th- and 19th-century navies to the 20th-century one, due to the prominence of small squadrons in that period. Stephen Howarth's *To Shining Sea: A History of the United States Navy, 1775–1991* (1991) is similar in coverage, though written in a narrative style that highlights the cooperation between the Royal Navy and the U.S. Navy in World War II, particularly the campaign for control of the Atlantic. H. P. Willmott's two volumes (out of a planned three) of *The Last Century of Sea Power* emphasize the productive capacity of the American shipbuilding industry and are replete with detailed charts and graphs.

Utilizing a topical, rather than chronological approach, Michael Palmer's *Command at Sea* (2005) focuses on command and control structures in naval history. Palmer argues that while naval doctrine and tactics are important, effective navies combine tactics with a decentralized command and control system that gives significant decision-making authority to local naval commanders. He notes that continued advances in communications technology have made this approach more and more difficult to practice. Despite its title, Frank Uhlig's *How Navies Fight: The U.S. Navy and Its Allies* (1994) uses a series of historical examples to demonstrate that the U.S. Navy has traditionally fought

to protect or attack sea lines of communication or to support troops on shore. Craig Symonds's *Decision at Sea* (2005) provides an overview of U.S. naval history by examining five central naval battles. Finally, Andrew Gibson's and Arthur Donovan's *The Abandoned Ocean: A History of United States Maritime Policy* (2000) covers government policy on seaborne commerce with deep ties to naval matters. The authors argue that during the Cold War the U.S. Merchant Marines became substantially more dependent on government subsidies due to the need for a fleet of transports in the event of a general war with the Soviet Union. At the same time, rising overseas competition limited expansion in U.S.-flagged merchant ships.

Revolution and Early Republic

Due in part to published collections of primary source documents, early American naval history has been the subject of several recent works. Spencer Tucker's *The Jeffersonian Gunboat Navy* (1993) examines the performance of the president's signature naval project from 1805 to 1816. Tucker notes the utility of the gunboats in enforcing the embargo and their failures in operations against the Royal Navy in the War of 1812. Christopher McKee's *A Gentlemanly and Honorable Profession: The Creation of the U.S. Naval Officer Corps, 1794–1815* (1991) argues that the U.S. Navy's first civilian leaders created the organizational conditions for developing effective officers, such as a decentralized command and control system.

The most noticeable trend in early American naval history has been toward biographies. John Schroeder's *Matthew Calbraith Perry: Antebellum Sailor and Diplomat* (2001) contends that the commodore was the central naval officer of the era, highlighting M. C. Perry's interest in technology and his concern for the welfare of both officers and enlisted men. David Skaggs's *Oliver Hazard Perry: Honor, Courage, and Patriotism in the Early U.S. Navy* (2006) illustrates the role of political patronage in the career of another young naval officer, O. H. Perry. Skaggs highlights O. H. Perry's skills as an operational commander during the War of 1812, particularly during the Battle of Lake Erie. Claude Berube and John Rodgaard's *A Call to the Sea: Captain Charles Stewart of the USS Constitution* (2005) cover the 60-year career of one of America's

most successful early frigate captains. The authors contend that as a squadron commander after the War of 1812, Steward was a particularly skilled naval diplomat.

Civil War

As one of the few underexplored aspects of the Civil War, naval history has grown significantly in recent years. Spencer Tucker's *Blue & Gray Navies: The Civil War Afloat* (2006) is a broad survey of the naval war based on the most recent scholarship that should serve as the starting point for naval investigations. Stephen Taaffe examines the roles of President Lincoln and Secretary of the Navy Gideon Welles in selecting and removing squadron commanders in *Commanding Lincoln's Navy: Union Naval Leadership During the Civil War* (2009). Though the Civil War was the U.S. Navy's first squadron-level conflict, Taaffe argues that Lincoln's practical delegation to Welles and Welles's wartime improvement in identifying and promoting commanders was a major contribution to Union victory. Craig Symonds's *Lincoln and His Admirals* (2008) covers much of the same material as Taaffe, emphasizing the role of personality in the naval high command and the relationship between Gideon Welles and Assistant Secretary of the Navy Gustavus Fox. Gary Joiner's *Mr. Lincoln's Brown Water Navy: The Mississippi Squadron* (2007) also explores the role of personality in interactions between the navy and army at the level of commanders, interactions that were most frequent along the rivers and canals of the western theater. Joiner concludes that due to the lack of an agreed-on structure for coordinating operations, cooperation was heavily dependent on the personalities of senior army and navy commanders being compatible. In *Industrializing American Shipbuilding: The Transformation of Ship Design and Construction, 1820–1920* (2006), William Thiesen argues that the Civil War placed a critical role in the American shipbuilding industry's shift from an artisan, craft-based style to a more scientific, technical approach to naval construction. William Roberts also deals with shipbuilding practices in *Civil War Ironclads: The U.S. Navy and Industrial Mobilization* (2002). Roberts argues that the navy's 20th-century pattern of utilizing the project office concept and developing connections with inland shipbuilders had its roots in the Civil War.

A recent debate in the Civil War naval scholarship centers on the experience of African American sailors in the U.S. Navy. Steven Ramold's *Slaves, Sailors, Citizens: African Americans in the Union Navy* (2002) began the discussion by arguing that Black sailors received better treatment from the navy as an institution as did Black soldiers from the army. Ramold highlights progressive naval racial policy on issues such as pay, legal recourses, and promotion to make his case. Barbara Tomblin's *Bluejackets and Contrabands: African Americans and the Union Navy* (2009) supports Ramold's position by analyzing the risks taken by Union sailors and warships to aid Black sailor's families still behind Confederate lines. Michael Bennett disagrees with Ramold and Tomblin in *Union Jacks: Yankee Sailors in the Civil War* (2004), arguing that racism was prevalent in White naval circles throughout the war, using letters and diaries from White sailors as sources.

Mahan and the New Navy

Mahan's conclusions on the nature and effectiveness of sea power have been the subject of several recent works. Jon Sumida's *Inventing Grand Strategy and Teaching Command* (1997) argues that Mahan was not solely concerned with promoting a navalist program to the American public. Mahan also sought to analyze and explain sound command decisions made by past naval leaders in an effort to demystify the process for younger officers. The contents of a conference at the Naval War College on Mahan were published in *The Influence of History on Mahan* (1991), in which a variety of naval historians presented a series of papers on Mahan's thought and influence.

The navy in Mahan's day was also marked by the steady professionalization of the officer corps and the deployment of increasingly modern, metal warships. Mark Shulman's *Navalism and the Emergence of American Sea Power* (1995) surveys this period, noting the active efforts made by navalists to garner public support for increased warship construction. Shulman examines the fundamental changes in the navy's technology and doctrine in a series of topical chapters. James Bradford's edited volume, *Crucible of Empire: The Spanish-American War & Its Aftermath* (1993), examines the first combat performance of the New Navy, emphasizing the informal cooperation between army and navy officers that helped bring the war to a rapid conclusion.

World War I

For a broad, thorough survey of the U.S. Navy's role in the First World War, see William Still's *Crisis at Sea: The United States Navy in European Waters in World War I* (2007). Still uses topical chapters to discuss everything from sailors' health to relationships with allies. The author argues that Vice Admiral William Sims deserves praise for determining that the Americans could best assist the Royal Navy by focusing on antisubmarine warfare. Rodney Carlisle's *Sovereignty at Sea: U.S. Merchant Ships and American Entry Into World War I* (2009) emphasizes the role that German submarine attacks on American-owned and -operated merchant ships played in President Wilson's decision to enter the war. Noting that aircraft were first employed by the U.S. Navy in the war, Geoffrey Rossano's *Stalking the U-Boat: U.S. Naval Aviation in Europe During World War I* (2010) demonstrates the challenges of building a naval aviation branch in a foreign territory in the midst of a combat situation.

Interwar

Increasingly, naval historians have highlighted the technological advancement of the interwar years, particularly with regard to aircraft, and the navy's broadly successful adaptation to these new realities. In *Battle Line: The United States Navy, 1919–1939* (2006), Thomas and Trent Hone survey the interwar navy, examining training, life at sea, and procurement, among other subjects. The authors argue that the navy's effectiveness during World War II was entirely dependent on a core body of trained, organized, and motivated sailors and officers that was developed before the war. John Kuehn's *Agents of Innovation: The General Board and the Design of the Fleet That Defeated the Japanese Navy* (2008) demonstrates the critical role of the General Board, a policy group composed of midlevel and senior officers, in fostering a culture of innovation within the navy. Kuehn argues that the board worked with the Naval War College to promote rigorous testing and experimentation of proposed technological and doctrinal developments. Edward Miller's *War Plan Orange: The U.S. Strategy to Defeat Japan, 1897–1945* (1991) describes how the navy developed a war plan and then largely executed its pre-war plan in the Pacific campaign of World War II.

In *All the Factors of Victory* (2003), Thomas Wildenberg chronicles the life and work of Admiral Joseph Reeves, particularly in the development of carrier aviation doctrine. Wildenberg credits Reeves with presciently emphasizing high operating tempos and high aircraft capacity for the navy's small but growing number of aircraft carriers. Finally, Phillips O'Brien in his *British and American Naval Power, 1900–1936* (1998) argues, in contrast to traditionally negative accounts, that the 1922 Washington treaty system was a successful formula for naval parity between the U.S. Navy and the Royal Navy in a time of rapidly evolving technology and a changing international strategic situation.

World War II

Malcolm Murfett recently completed a new, synthetic survey of the Second World War at sea, *Naval Warfare 1919–1945: An Operational History of the Volatile War at Sea* (2009), that provides in-depth coverage and analysis of the U.S. Navy's role in the conflict. Murfett emphasizes that events occurred in rapid succession around the globe, forcing naval commanders to repeatedly move back and forth between theaters. A recent trend in American World War II studies has been an emphasis on shipbuilding. Thomas Heinrich's *Ships for the Seven Seas* (1997) examines the collection of shipbuilding companies centered on Philadelphia, with particular emphasis on the World War II period. Michael Lindberg and Daniel Todd's *Anglo-American Shipbuilding in World War II: A Geographical Perspective* (2004) highlights the conglomerations of shipbuilding companies in specific geographic regions in each nation and provides valuable reference data on naval construction. Gary Weir's *Building American Submarines, 1914–1940* (1991) and *Forged in War: The Naval-Industrial Complex and American Submarine Construction, 1940–1961* (1993) illustrate the flow of money, expertise, and personnel between the Portsmouth navy yard and the Electric Boat Company that built much of the navy's wartime submarine fleet. Weir argues that personal connections between business executives and naval officers were more important than official linkages through the mid-Cold War period.

As archival material on clandestine activities becomes available, several historians have taken the opportunity to investigate the navy's intelligence

apparatus and operations. Alan Bath's *Tracking the Axis Enemy: The Triumph of Anglo-American Naval Intelligence* (1998) highlights the role of intelligence in the Anglo-American relationship. Bath argues that collaboration between the two naval intelligence services was closest during the convoy battles of 1942–1943 and was less coordinated in other theaters. Phyllis Soybel's *A Necessary Relationship: The Development of Anglo-American Cooperation in Naval Intelligence* (2005) also examines intelligence cooperation, arguing that the American intelligence service reacted passively to Royal Navy initiation through 1942, both in intelligence sharing and equipment exchanges. Douglas Ford's *The Elusive Enemy: U.S. Naval Intelligence and the Imperial Japanese Fleet* (2011) examines the development of American naval intelligence and its impact on American naval doctrine in the Pacific. Ford concludes that American intelligence lacked sufficient information on the Japanese navy early in the war but gained experience through prolonged contact in combat.

Other studies on coalition warfare include Ian Cowman's *Dominion or Decline: Anglo-American Naval Relations on the Pacific, 1937–1941* (1996), which emphasizes the divide between the Royal Navy and the U.S. Navy with regard to prewar Pacific planning. Kevin Smith's *Conflict Over Convoys: Anglo-American Logistics Diplomacy in the Second World War* (1996) discusses the role of maritime shipping in the “special relationship” and argues that political leaders on both sides of the Atlantic were unprepared to handle the logistical challenges of global warfare. Charles Koburger highlights American concern over Vichy France's efforts to rebuild the French fleet and the diplomatic challenges for American naval officers dealing with French colonies in the Caribbean in *Franco-American Naval Relations, 1940–1945* (1994).

Cold War

Historical works on the U.S. Navy's role in the Cold War have become more common as the conflict recedes into history. David Winkler's *Cold War at Sea: High-Seas Confrontation Between the United States and the Soviet Union* (2000) provides a good survey of the navy's conflict with the Soviet Navy and its transition into a power projection role. Edward Marolda's edited volume, *The U.S. Navy in*

the Korean War (2007), is a collection of essays that provide broad treatment of the various roles performed by the navy in the conflict. Malcolm Muir's *Black Shoes and Blue Water: Surface Warfare in the United States Navy, 1945–1975* (1996) highlights the role of technological change in the Cold War navy, particularly the influence of nuclear power and missiles.

R. L. Schreadley's *From the Rivers to the Sea: The United States Navy in Vietnam* (1992) covers the breadth of the navy's involvement in Vietnam from the critical perspective of a naval veteran of the conflict. Thomas Cutler's *Brown Water, Black Berets: Coastal and Riverine Warfare in Vietnam* (2000) emphasizes the experience of American and Vietnamese sailors serving in riverine or littoral waters. Cutler argues for the effectiveness of naval interdiction efforts using advisor reports and captured North Vietnamese documents.

Paul Stillwell's *The Golden Thirteen: Recollections of the First Black Naval Officers* (1993) was one of the first works to examine the experience of Black sailors in the post–World War II navy. Robert Schneller's *Breaking the Color Barrier: The U.S. Naval Academy's First Black Midshipmen and the Struggle for Racial Equality* (2005) argues that the midshipmen's success in any given time period was predicated on the national, naval, and personal racial attitudes and policies as well as the abilities of the individual midshipmen.

Edward Marolda's *Shield and Sword: The United States Navy and the Persian Gulf War* (1998) stresses the navy's culture and provides an in-depth analysis of naval leadership, concluding that the Persian Gulf conflict marked a shift in the navy's thinking from the high seas to littoral regions.

Conclusion

U.S. naval history is a vibrant field within the broader military history and American traditions. Numerous scholars continue to publish high-quality works on a variety of naval topics each year. In recent years, studies have emphasized logistics, the U.S. Navy as an institution and an organization, social naval history, the shipbuilding industry, strategic planning, and naval officer education. Biographies of lesser known innovators and officers are also beginning to appear, as the most popular commanders and naval leaders have already been covered.

The Naval Institute Press, the University Press of Florida, and the University of South Carolina Press regularly publish naval histories, in addition to the Naval History and Heritage Command's in-house publishing shop. Naval history articles are frequently found in the *Journal of Military History*, the *International Journal of Naval History*, *Naval History*, *Proceedings*, *The Northern Mariner*, and the *Journal for Maritime Research*.

HIV/AIDS

The acquired immunodeficiency syndrome (AIDS) is an infectious disease caused by the human immunodeficiency virus 1 and 2 (HIV-1 and HIV-2). Infection spreads through transfer of fluids from one person to another, mainly through sexual intercourse and also through intravenous drug use and blood transfusions. HIV is a retrovirus that impairs immune system function, leaving those afflicted open to infections, such as pneumocystis pneumonia and cytomegalovirus. When AIDS first appeared as a medical category in the 1980s, no effective treat-

ment existed, and the disease led almost inevitably to death. The U.S. military acted quickly to screen inductees and active service personnel. Currently, no cure exists for AIDS, but successful treatments can control the disease. Within the U.S. military, AIDS cases have declined to a small number, and the disease has no impact on military effectiveness. In developing countries, however, AIDS poses major issues for uniformed services. This entry discusses AIDS and HIV in the U.S. military.

The first cases of AIDS appeared in 1981 among gay men in Los Angeles and later in other parts of the United States and in other populations, including intravenous drug users and Haitians. By 1984, researchers in the United States and France identified the HIV retrovirus responsible for the infection, and a team at the National Institutes of Health developed a blood test for HIV infection by identifying HIV antibodies in blood samples. That same year, the first known case in the U.S. military appeared when an army recruit fell ill after vaccination for smallpox. After being admitted to Walter Reed Medical Center for treatment, he was diagnosed with AIDS. He died 18 months later.

In response to the AIDS epidemic, the Department of Defense instituted a policy of testing all military personnel. All recruits receive tests for HIV along with their physical exams during induction. Positive tests exclude them from service. Active-duty personnel are tested on a regular basis. Those who test positive are retained but excluded from overseas deployment. Commanders and medical personnel would order the HIV-positive service member to inform any potential sexual partner that he or she is HIV positive; failure to do so would make the service member subject to disciplinary action under the Uniform Code of Military Justice. These policies, taken together, reduced the number of active service personnel with HIV infection from 2,853 in 1986 to just 550 in 1991. By 2002, HIV infection in the military was only 1 or 2 in 10,000, one tenth the rate in the general U.S. population.

AIDS became one of the central issues discussed when the military reviewed policies excluding gays and lesbians from service. Globally, the major means of transmission of HIV is through heterosexual intercourse. In the United States, however, up to 75% of infections are due to male homosexual relations. When President Bill Clinton, in 1993, ordered a review of military policies regarding gays and

lesbians in the services, the perception that AIDS was a “gay disease” still held sway. Many within the military argued that recruiting gays and lesbians would increase HIV infections within the military. Also, military personnel are often vaccinated with live-virus vaccines. This was seen as a risk for inducing AIDS in those who were already HIV-infected. Related to this was the concern about the military blood supply. On deployment, military personnel often act as blood donors for medical emergencies. The original policies regarding exclusion of HIV-infected recruits had identified the blood supply as a central concern, and this concern reemerged during the discussions that led to the adoption of the Don’t Ask, Don’t Tell policy in 1994 (repealed in 2011).

When physicians first identified AIDS in the 1980s, no successful treatments were available. Since the 1990s, treatment of HIV-infected individuals with combinations of antiretroviral agents has successfully reduced both mortality and morbidity related to HIV infection. In the U.S. military, those with HIV infection can continue to serve, and only 4% to 8% leave the service due to AIDS or HIV-related medical problems. The success in treating HIV infection has led to a lowering of concerns about infection and its consequences in the general U.S. population and within the military. This change in attitude appears to have led to an increase in risky behavior among military personnel. Condom use across the military services is about 50%, with a documented decline in condom use among naval officers in the 2002–2005 period. The navy, which has the highest rate of infection, is at particular risk. Only about 5% of military personnel stationed in the United States make use of commercial sex workers, who are considered a high-risk population for HIV transmission. But with its worldwide deployment, naval personnel are far more likely to employ commercial sex workers. One study in 1993 showed that 42% of sailors on a 6-month tour had used commercial sex workers. In the 10 years following 1999, rates of HIV infection in the navy doubled to 36 positive tests for 100,000 sailors tested.

Although AIDS remains a personal tragedy, within the U.S. military, the infection rate is much lower than in the civilian population. Periodic testing and excellent medical care provide means for containing the harm from HIV infection. The situation in the militaries of many developing countries is starkly different. Rates of infection among the young men in

uniformed services in the developing world are 2 to 5 times higher than in the civilian populations, with sharp increases in infection rates during mobilization. These countries generally have less access to antiretroviral drugs needed for treatment. Some authorities estimate that for countries where the AIDS epidemic has become most widespread, up to half of military personnel are infected. Not only are the uniformed services at high risk for contracting HIV infection, but they become a major source of spreading HIV infection along with other sexually transmitted infections.

HOMELAND SECURITY

See Civil Defense

HOMELAND SECURITY, DEPARTMENT OF

The Department of Homeland Security (DHS), which came into existence on March 1, 2003, was the largest national government reorganization

since the creation of the Department of Defense, the Central Intelligence Agency, and the National Security Council, all outcomes of the National Security Act of 1947. The new department, the result of the Homeland Security Act of 2002, was organized by bringing together 22 disparate organizations and entities from across the national government. Notable inclusions in the new department are the Federal Emergency Management Agency, the Secret Service, the U.S. Coast Guard, the Border Patrol, the U.S. Customs, several entities related to immigration, and the new Transportation Security Agency. Also included in this array were several offices from the Department of Justice. Though the purpose of the department was clearly outlined in the legislation, over time the mission space was defined around preventing, protecting from, responding to, and recovering from incidents of national significance. Though the nation is perceived to be safer and expectations remain high for this new organization, the overall performance of the department has been disappointing and a chasm between the homeland security apparatus at the national level and that of the 39,000 general purpose jurisdictions at the state and local levels has remained problematic. This entry examines the development of the DHS and discusses challenges and future directions.

The Beginning: 9/11

Following the devastating terror attack on the United States on September 11, 2001, the legislative and executive branches of the national government took swift action to form an organization that might address how to secure the nation from devastating acts of terror. Immediately after the attacks of 9/11, government entities at all levels began working together to ensure that “homeland security” would be a national effort, not just a federal one. However, this level of goodwill and cooperation would not last for long. Inside the new department, the various agencies were having difficulty sorting out roles and mission space. Many of the units brought into the new department were still performing duties that had little or nothing to do with homeland security. There were also clear disagreements over what should or should not be done in building national homeland security public policy. Over time, a bevy of national policy documents were issued that,

unfortunately, could be characterized as top-down, one-size-fits-all, federal-centric, and focused on terrorism through weapons of mass destruction. This approach was not congruent with the evolution of homeland security thinking at the state and local levels of government.

After the initial shock of the attacks was absorbed and the first burst of grant funding had been dispersed to state and local governments, those jurisdictions below the national level absorbed homeland security responsibilities into the public safety and emergency management domains. Though terrorism was certainly a large concern for most of the larger metropolitan areas in the country, other concerns affected the judgments—and budgets—of smaller jurisdictions. Terrorism was but one of many “hazards” that concerned most local governments. Their orientation toward an “all-hazards” approach to protecting their constituents was galvanized by the far more common occurrences of flooding, wild fires, earthquakes, tornados, and hurricanes. Similarly, with each passing year, grant funding from the national government dropped off precipitously. At one point in the immediate aftermath of 9/11, some 19 grant programs were dispensing funds to state and local governments, of which only about half were controlled by the new department. To this day, special grant funding for emergency management, fire services, and law enforcement are still not controlled by DHS.

Many of the difficulties encountered in the new department can be assigned to institutional pathologies. For instance, though oversight in Congress of the Department of Defense is found in some 36 separate committees in the House and Senate, the DHS must answer to 80 committees, even though the Defense budget is 10 times that of DHS. All together, 412 of the 435 representatives and all 100 senators have committee assignments with DHS oversight responsibilities. Officials at the DHS are constantly being called to Capitol Hill to provide testimony. This intrusion into the daily workings of a nascent department has had a deleterious impact on retention and morale. Furthermore, each of the secretaries charged with running the department has conducted extensive studies and has led countless attempts to reorganize.

Apart from the issues related to state and local budget, revenue, and tax constraints, perhaps the greatest shortfall in developing cooperation with

Congress and state and local governments has been the resistance at DHS to engage elected officials in the policy development process. In a host of initiatives that include the development of public policy documents dealing with national preparedness, officials representing the executive branch have been remiss in reaching out to elected officials, particularly at the state and local levels. The face of an incident is not that of the local emergency management director or police chief. The face of the incident is likely to be a mayor or a governor. State and local executives and legislators have not been included in the development of homeland security public policy.

In summary, the instability caused by the constant organizational upheaval and institutional conflicts have only exacerbated the problems facing the Department of Homeland Security. Matters were not helped by the perceived weak performance of the new department during Hurricanes Katrina and Rita in the late summer of 2005.

Challenges and Change

Hurricane Katrina was a late summer storm that came ashore near the city of New Orleans, Louisiana. Though significant warning was available, a host of problems arose that left the most vulnerable elements of the population of the city in harm's way. After the storm made landfall, several of the protective dikes around the city gave way, flooding the lowest, and poorest, neighborhoods and destroying nearly all real and personal property in the area. The vivid pictures of people stranded on rooftops and huddled together in the Superdome broadcast on the news left the impression that government at all levels had abandoned those most vulnerable. Though the reality was quite different, the perception and narrative were set. The new department, given its first test, had failed. In particular, the Federal Emergency Management Agency and the president were to take most of the blame. When Hurricane Rita came ashore in Texas a month later, things were not much better. In the area around Houston, individuals who had escaped Katrina were again asked to evacuate to avoid the devastation of this newest storm. Again, DHS did not cover itself with glory.

In the aftermath of Hurricanes Katrina and Rita, Congress passed legislation that was intended to correct perceived shortfalls at the national level,

particularly when DHS would be called on to assist state and local governments in the future. Though many of the post-Katrina recommendations have been adopted, there remain significant disconnects between the national government and those charged with protecting citizens at the state and local levels.

Between 2007 and 2010, DHS has issued a host of documents that were intended to broaden the outreach to state and local government stakeholders and to expand federal government support of all hazard policies that dominate actions at the lower levels of government. Regardless of the rhetoric used to socialize these new documents, the policies within are still focused predominantly on terrorism and are even more federal-centric than in the past. This approach to homeland security national public policy has resulted in some interesting outcomes across the country. Making matters worse has been the devastating impact of a stressed economy, felt hardest at the state and local levels.

Over the past decade or so, jurisdictions seeking support from the national government through presidential disaster declarations have increased dramatically. Because of the 24-hour news cycle, most administrations have yielded to the pressure of showing some activity, particularly in the form of advancing support through financial means to victims of natural disasters. The tendency of the national government to grant these declarations has had some significant unintended consequences. Though cooperation and mutual aid have become more common among jurisdictions, there are some interesting dynamics occurring. When jurisdictions share common borders, the governments have a greater inclination to build formal mutual aid agreements. This interlocal cooperation is most prevalent in metropolitan areas where the core city holds a significant fraction of the population. Cooperation among jurisdictions occurs even in smaller metropolitan areas that have several distinct governments sharing a common regional interest. However, as has been identified in several studies, some smaller urban areas that are some distance from major urban centers have underfunded various responder functions knowing, or anticipating, that larger jurisdictions will come to their aid if catastrophes occur. The risk calculations associated with this pathology are reflected in public budgets. Though formal agreements dominate arrangements in urban areas,

such is not the case in less populated regions of the country.

Small urban centers and rural areas form mutual aid arrangements based on personal relationships and informal agreements. Most of these jurisdictions lack the administrative and operational capacity to develop their own source capabilities, and because resources are scarce, governments are incented to find partners with whom they might form support bonds. One need look no further than the events in Greensburg, Kansas, or Parkersburg, Iowa, both devastated by tornados in recent years, to see how this type of cooperation plays out. Furthermore, emerging research seems to indicate that political culture may influence the willingness of governments to cooperate in homeland security preparedness efforts.

Since the beginning of the economic downturn in 2008, state and local jurisdictions have been faced with extraordinarily difficult policy decisions related to revenue and spending priorities. Any expectation on the part of the national government that these government entities would change funding levels to enhance public safety, emergency management, or homeland security is misguided and uninformed. Nearly every state has had to find ways to balance budgets without affecting areas such as education, economic development, public health, job training, and transportation infrastructure. Often, rather than enhancing public safety capacities, elected officials must reduce funding to this area to meet the expectations and preferences of local and state constituents. Though the disconnect between the national government and the rest of the country may be profound, there are initiatives being considered that may someday close the distance between levels of government in homeland security public policies.

One of the most significant changes in national-level policy has been the merging of the Homeland Security Council with the National Security Council. The concept that national security encompasses homeland security seems a step in the right direction. Furthermore, programs such as those outlined by the Project for National Security Reform, a bipartisan research effort focused on revamping the entirety of the national security apparatus, offers organizational, legislative, and administrative options that will enhance interagency cooperation that is currently functioning at less than efficient levels.

Future Directions

Though the DHS has yet to fulfill its promise, the future seems brighter. As the number of homeland security professionals at the national, state, and local levels increases, policy options offered by DHS are more likely to be sensitive to and considerate of the vagaries of governing at the state and local levels. Similarly, as the economy begins to recover, more revenues flowing into public coffers will most certainly lead to increased cooperation among jurisdictions and expanded administrative and operational capacities in each jurisdiction around the country. Perhaps of greater significance is the advancement of new concepts of community resilience that reflect a more holistic approach to the protection of constituents that better reflects the preferences of citizen-voters. Through the interdisciplinary study of the social intelligence of a community, elected officials and responder professionals can identify at-risk populations, develop policies that mitigate risk, and focus on those factors that unnecessarily divert resources from safe, secure, and self-sustaining neighborhoods and communities.

HUMAN RIGHTS

The military defines human rights as freedoms, immunities, and benefits inherent to all human beings. These are not concessions by governments but rather they derive from the inalienable and universal dignity of human persons. Human rights include fundamental protections for individuals such as freedom from genocide, slavery, murder, torture, cruel or degrading treatment, prolonged arbitrary detention, and systematic racial discrimination. While governments do not bestow these rights on their citizens, they are required to guarantee them.

In international relations, human rights function to help secure peace, deter aggression, promote rule of law, combat crime and corruption, strengthen democracies, and prevent humanitarian crises. Since World War II, the United States has included the promotion and respect for human rights, as embodied in the Universal Declaration of Human Rights, as a central goal in its foreign policy. The military, as the defender and promoter of U.S. foreign policy goals, is often tasked with this objective. The U.S. military believes that adhering to both the law of armed conflict and international human rights law will result in a more comprehensive prevention of abuse.

The United States, however, is not the only actor concerned with protecting human rights in the global arena. Since the 1970s, the international community has increasingly viewed human rights protection as a duty falling not only within the jurisdiction of national governments. Transnational advocacy networks and civil society actors have worked to shift the definitional understanding of sovereignty to require global actors to act if governments were not protecting their citizens from systematic human rights abuses. In this new conception, the international community possessed a duty to intervene and protect groups and individuals from abuses. While this ideal of human rights protection is generally accepted, as evidenced by the overwhelming adoption of the Responsibility to Protect Doctrine in the UN General Assembly in 2005, its application in institutions such as the International Criminal Court has met resistance from a variety of actors around the globe, including the United States.

This entry lays out the history of human rights in international law, its uneven adoption in U.S. foreign policy during and after the Cold War, and the military's evolution of responsibility in protecting human rights abroad.

Background

The current tenets of human rights first emerged from natural rights thinkers such as Hugo Grotius, John Locke, and Thomas Paine and were embodied in documents such as the Magna Carta (1215), the English Bill of Rights (1689), and the French Declaration on the Rights of Man and Citizen (1789). These slowly grew to become internationally accepted principles and were codified in international law in the aftermath of World War II. Symbolized by the world community forming the United Nations, nation-states explicitly recognized fundamental human rights and took responsibility for protecting them through international agreements and laws.

The first of these documents to enshrine these rights was the Universal Declaration of Human Rights (1948). While not a treaty or legally binding, it was the first document to lay out the broad spectrum of human rights in a comprehensive manner. Now many provisions are considered customary international law or have been incorporated into binding international human rights treaties such as the International Covenant on Civil and Political Rights; the International Covenant on Economic, Social and Cultural Rights; the Convention on the Prevention and Punishment of the Crime of Genocide; and the Convention Against Torture and Other Cruel, Inhuman, or Degrading Treatment or Punishment. While these documents reflect the evolving and expanding nature of rights, their definitions and enforceability, both domestically and internationally, are continually evolving.

The creation of the United Nations after the end of World War II proved to be an exceptional moment in the history of human rights. For decades afterward, however, human rights lacked the sustained attention of the international community to push toward their implementation. During the Cold War, international action to protect these rights was

English monarchs, including Henry III, confirmed the Magna Carta several times after 1225; each subsequent issue followed the form of the “final” version. With each confirmation, copies of the document were made and sent to the counties so that everyone would know their rights and obligations. Of these original issues of the Magna Carta, 17 survive—4 from the reign of John, 8 from that of Henry III, and 5 from Edward I, including the version now on display at the National Archives.

largely subordinated to Cold War concerns. The signing of the Helsinki Final Act in 1975, where 35 nations established 10 basic principles for relations among participating states including “respect for human rights and fundamental freedoms,” stands out as a unique achievement during this period. The 1978 creation of Helsinki Watch, a nongovernmental organization committed to monitoring Soviet bloc countries’ adherence to the human rights principles of the agreement, indicates that even in the midst of Cold War polarity, human rights claims gained traction and began to play a serious role in international relations. The success of the accords, however, proved the exception, as many other attempts to enforce human rights met resistance as a thinly veiled attempt to further one of the polarized Cold War aims.

Human Rights in U.S. Foreign Policy

The strictures of the Cold War extended to the United States—human rights were largely subordinated to anxiety over communism. For almost three decades after the adoption of the Universal Declaration of Human Rights, human rights took a backseat to these other geopolitical concerns.

Human rights reemerged as an issue of international attention during Jimmy Carter’s presidency when he ran on a platform of returning morality to international affairs. Then, in his inauguration in January 1977, he declared that “human rights must be absolute.” Domestic and international human rights groups proliferated simultaneously, both as a response to this presidential attention and as a reaction to the transnational advocacy networks that emerged to protest the abuses in the Southern Cone. In 1977, Amnesty International also received the Nobel Peace Prize. All these events appeared to indicate that human rights were taking their place as an accepted norm on the international scene. Yet the Carter administration struggled with the enforceability of this ideal in the application of foreign policy, especially as it continually conflicted with bipolar Cold War objectives. Therefore, as Carter confronted a flailing economy, the Soviet invasion of Afghanistan, and the Iranian hostage crisis, his presidency faltered, and human rights receded as the central, organizing

principle in his foreign policy. By the time Ronald Reagan ascended to the presidency, he and his ambassador to the United Nations, Jeane Kirkpatrick, promoted a much diffused human rights policy outlined in an article titled "Dictatorship and Double Standards." In this article, they laid out their case for tolerance toward regimes that were pro-American, authoritarian regimes with poor human rights records, and advocated using tough rhetoric only against totalitarian states with a communist bent.

It was not until the fall of the Berlin Wall that human rights reemerged with salience on the international scene. Without the Cold War subjecting human rights attempts to the narrow interpretation of supporting or undercutting communism, human rights organizations flourished, and these principles surfaced again as a concern in the presidential agenda. President Bill Clinton pursued a policy of enlargement and engagement where security at home could best be secured by spreading human rights and democracy abroad. Clinton applied this theory selectively with mixed success.

This difficulty is evidenced by examining his attempts to involve the United States in peacekeeping operations. While the United Nations had also largely been constrained by the pressures of the Cold War, the 1990s witnessed an emergence of peacekeeping as a method for the United Nations to protect human rights in nations that suffered from grave societal violence. One of the first missions the United States became involved in was in Somalia, where, in response to conditions of the world's worst poverty, famine, and lawlessness, the United States led a peacekeeping operation called the UN Operation in Somalia. From 1992 to 1993, the U.S. military sought to establish rule of law and a secure environment for humanitarian relief operations.

Unfortunately, after 19 U.S. soldiers were killed in Mogadishu in 1993, which severely dampened U.S. enthusiasm for intervening abroad to ensure human rights, the United States withdrew its forces from the country. In theory, human rights seemed an ideal worth protecting, but not when U.S. interests were not directly being threatened and where

Somalis off-load rice and other relief supplies from a Saudi Arabian freighter at the seaport. The Saudis are providing relief supplies to the Somalis under the auspices of UN Operation in Somalia II.

U.S. servicemen could be put in harm's way. This sentiment was palpable in 1994 when the Clinton administration failed to intervene in the genocide in Rwanda, and 800,000 people were killed in only 100 days. While Clinton ultimately apologized for this failure, his inaction proved the continual limitations in enforcing human rights.

In what is largely considered one of the mediated successes of international peacekeeping, Clinton chose to intervene in the Balkans where ethnic rivalries exploded in violence after the Iron Curtain fell. Here, the United States sought to intervene to stop the bloodshed through a North Atlantic Treaty Organization force with UN backing. While this U.S.-led endeavor did eventually stop Slobodan Milosevic's abuses, the lingering ethnic violence and difficulty the international community confronted in establishing stable states in the region demonstrate the complex task of human rights protection. Even when forceful eruptions of violence are stemmed, the societal conditions that created these mass atrocities have proved more difficult to address.

These debates have continued in the 21st century. As Al Gore and George W. Bush vied for the presidency in the 2000 election, they each grappled with whether the United States had a responsibility to play an active role in the enforcement of human rights abroad. While George W. Bush originally denounced active intervention abroad, once in office, his administration rhetorically adhered to the idea of promoting human rights and democracy as a key part of their fight against terror and their objectives in Iraq and Afghanistan. This human rights posture proved difficult to defend as scandals like Abu Ghraib (where U.S. guards abused Iraqi prisoners) and Haditha (the Iraqi town where U.S. soldiers killed civilians) surfaced.

Human rights debates also continued during the Bush administration around ideas of international justice. In 2002, the international community ratified the Rome Statute, which established the International Criminal Court, an international body tasked with prosecuting individuals who perpetrated the worst crimes against humanity. This court reflected a growing transnational movement of human rights advocates that sought to institutionalize the protection of international human rights norms. The United States failed to ratify the treaty

and, during the Bush administration, remained largely disengaged from the proceedings of the court. The Obama administration has also failed to ratify the treaty but appears more cooperative in working with the court to pursue its aims. In addition, the Obama administration has convened a review process to reevaluate U.S. policy toward the International Criminal Court.

President Barack Obama brought a new energy and perspective to the U.S. involvement in international human rights. During his campaign, Obama promised to make human rights and morality organizing principles of his foreign policy. At least in rhetoric, his success was lauded early in his administration as he won the Nobel Peace Prize in 2009. His actual achievement of these ideals, however, remains mixed amid his struggles to help the country recover from economic disaster.

Role of the Military in Promoting Human Rights

Since the 1950s, the U.S. Armed Forces have received training on the laws of war, which include how to conduct operations within acceptable parameters of these new human rights treaties. The U.S. military is trained to understand and incorporate principles of the Geneva Conventions.

Since the end of the Cold War, human rights training gained an even greater focus in the military, which called on personnel to undergo awareness training, investigate and report alleged abuses, and influence host countries to obey internationally accepted norms. The Department of Defense and the State Department understand the benefits of the U.S. military promoting human rights abroad, mainly as a means to encourage democratic growth and to contribute to counterterrorism. An emerging human rights consciousness also constrains military behavior in the treatment of prisoners and the conduct of operations in civilian areas, essential developments in an era of counterinsurgency. Human rights, therefore, continues to operate in military training and as a central principle for the U.S. military in organizing their mission objectives.

HUMANITARIAN INTERVENTION, FOREIGN

At the close of the Cold War, the United States and the Global North found themselves engaged in humanitarian intervention missions across the world. Joined together under the banners of the United Nations (UN) and the North Atlantic Treaty Organization (NATO), Western governments intervened in failed states plagued by political instability, ethnic tension, and famine. Despite intentions to stabilize worsening conditions, politicians and military forces struggled to find a strategy in the balance between doing too little and going too far. This entry discusses the post-Cold War evolution of humanitarian intervention, including the principles, motivations, and lessons of international humanitarian interventions.

The Foundation of Humanitarian Intervention

After the devastating experience of World War II, the international community joined together to recognize universal human rights unlike ever before. The newly formed United Nations and a multitude of human rights conventions, including the Universal Declaration of Human Rights (1948), signaled a giant leap forward. Many of these treaties on human rights were tempered by the ugly reality that nearly every state involved had embarrassing contradictory domestic policies from America's Jim Crow segregation to the Soviet's Red Terror. Nevertheless, the international community joined together to form the foundation, albeit imperfect, for a rules-based international system.

The promise of state sovereignty and protection from forceful intrusion was enshrined in the UN charter meant to establish a basis for world peace. The protections outlined in Article 2(4) of the UN charter could be overridden for reasons of self-defense or with a unanimous vote of approval by the UN Security Council (UNSC). Any such measure could be vetoed by one of the five permanent UNSC members: the United States, the United Kingdom, France, Russia, and China. Another exception is the 1948 Genocide Convention, which sought to protect against another genocide similar to the Holocaust, also provided an avenue for humanitarian intervention. Unfortunately, since the adoption of the Genocide Convention, roughly 20 million people have died in mass atrocities in 29 countries.

As the international community discovered after the Cold War, geopolitics corrupted the hope for a consensual, rules-based international system. In 1999, UN secretary general Kofi Annan questioned the failures of the system wherein a UNSC veto could prevent a justified intervention in genocide or, as history proved, another state or group of states could push ahead with an intervention without UNSC consent. This embodied the conflict between idealist and realist visions of international politics, one in support of a global rules-based system and the other only certain of the preeminence of crude geopolitical calculation. The record of post-Cold War humanitarian interventions demonstrated the persistent challenge to legitimize a rules-based international system in an environment where might makes right. Furthermore, geopolitical calculations of relative strength and risk of loss evidenced many states' selective interpretation of universal human rights.

Contemporary political debate often portrays humanitarian intervention as a recent phenomenon, but in fact, humanitarian intervention dates back hundreds of years. The 19th century in particular was marked by numerous interventions by Britain, France, and Russia in atrocities in Poland, Bulgaria, Syria, and Greece. These three powers famously aided Greece in its fight for independence from the Ottoman Empire. Although they risked defeat and their own national interest for humanitarian causes, they also stood to gain geopolitical advantage through expanded influence. Meanwhile American presidents shied away from foreign intrigues as John Quincy Adams famously warned that foreign interventions, even those that begin with the best of intentions, would lead America astray. The numerous humanitarian interventions after the fall of the Soviet Union in 1991 led many critics to reassess the prudence of this age-old observation.

Into the Breach: Post-Cold War Humanitarian Intervention

No longer confined by the Cold War, the United States emerged as the preeminent force in armed humanitarian interventions throughout the 1990s. Following Operation Desert Storm, in 1991, the United States, England, and France initiated no-fly zones to protect northern Kurds and southern Shia Muslims in Iraq from future attacks by Saddam Hussein. The no-fly zones remained until 2002 despite a decade of criticism for their use as leverage in support of weapon inspections rather than their official intent to protect civilians. The international community also grew increasingly frustrated as the no-fly zones lacked an official UNSC mandate, which made them technically illegal despite U.S. insistence otherwise.

Only 1 year later, the outcome of U.S. escalation of a UN intervention in Somalia in December 1992 threatened the future of humanitarian intervention. The then U.S. president George H. W. Bush sent U.S. military forces to reinforce an international effort to end a devastating famine. Security concerns threatened the mission, but U.S. forces, including civil affairs units, helped restore a secure environment and assist numerous nongovernmental organizations involved in the relief effort. Unfortunately, after the manhunt for Somali warlord General Mohammed Farah Aidid culminated in the “Black

Hawk Down” incident in 1993, public opinion and political willpower soon turned against the intervention. The political wrangling that ensued exposed the dangerously open-ended U.S. mission as well as conflicts between UN partners and the United States over mission leadership and strategy. The failed mission and resultant lingering embarrassment left U.S. politicians hesitant to intervene in similar situations for years.

In spite of Somalia, the United States led a multilateral, UNSC-mandated mission to reinstate Haitian president Jean-Bertrand Aristide in September 1994. Following prolonged political wrangling and one false start, the threat of U.S. military invasion of Haiti forced the military coup leadership to peacefully cede control to Aristide. Troops remained only long enough to ease the transition effort and establish a longer term UN peacekeeping mission.

Earlier that year, in April, U.S. leaders neglected ethnic hostility in Rwanda that turned to full-scale genocide. Having neglected warning signs including emphatic warnings from a small UN peacekeeping contingent, the international community did little to prevent the death of more than 800,000 Rwandans and nearly 75% of the Tutsi population. Fearful of another Somalia, the United States remained uninvolved and slowed discussion of intervention at the United Nations until July, after Tutsi Rwandan Patriotic Front rebels retook the capital from the incumbent Hutu-led government. Unlike Somalia, regrets of inaction in Rwanda overshadowed future crises, and many U.S. diplomats and politicians who watched the genocide unravel vowed to never again fail to act against genocide.

As early as 1992, Western nations cautiously observed a war in Bosnia as political forces stoked ethnic strife between Bosnian Serbs and Muslims. Limited measures including a UN-mandated no-fly zone in 1993 proved unable to stem the violence that climaxed in 1995 as Serbs massacred 7,000 Muslims in the town of Srebrenica. The massacre spurred the UNSC to approve an aggressive NATO air campaign followed by 60,000 NATO soldiers far more threatening than the previous UN peacekeeping force. The overwhelming force drove the Serbs into U.S.-led negotiations that established the Dayton Peace Accords that ended the war in December 1995. Although the intervention and overwhelming force successfully ended the violence, the massacre

at Srebrenica reminded many interventionists to act quickly and forcefully in the future in order to avert preventable catastrophes.

When tensions flared in Yugoslavia as Serbian forces invaded Kosovo in 1999, U.S. president Bill Clinton quickly led a NATO bombing campaign to preempt a human rights crisis. Although the strikes were successful and pushed the Serbian military out of Kosovo, the measures set an uneasy precedent. Eager to strike, the U.S. administration moved unilaterally without the consent of the UNSC. The resultant Clinton Doctrine used to explain the move suggested that in the future America would intervene in what it deemed humanitarian crises without the approval of the UNSC as long as American forces did not stand to suffer serious casualties. Despite success, the mission exposed the dangerous threat that unsanctioned unilateral action, not to mention geopolitical intrigue masquerading as humanitarianism, presented to the future of the UNSC and rules-based international system.

Humanitarian Intervention in the 21st Century

After a tumultuous decade of global instability, the Afghanistan and Iraq Wars dramatically reframed humanitarian intervention. Primarily billed as defensive reprisals against the al Qaeda threat, Iraq in particular increasingly relied on a humanitarian cant to justify continued stabilization and counterinsurgency operations. The tremendous cost of both wars emphasized the sacrifices required to lead full-scale regime change and reconstruction efforts with only a small coalition. Furthermore, the institutionalization of stability operations, outlined in the 2008 U.S. Army Field Manual 3-07, confirmed the increasing militarization of humanitarian aid work that threatened the perceived neutrality of aid workers.

Human rights abuses excused in the name of the Global War on Terrorism also raised fundamental questions about the legality and hypocrisy of U.S. efforts. The proliferation of torture, including the Iraq Abu Ghraib incident, black site renditions, and indefinite imprisonment of terror suspects at the U.S. naval base at Guantanamo Bay, Cuba, shook humanitarianism to the core. These offenses demonstrated the imperfection of the international system wherein powerful states escaped repercussions and voluntarily exempted themselves from international treaties they agreed to observe. Moreover,

treaty reservations and the complete lack of domestic enforcement of international law throughout the West warned of an uncertain future for human rights.

Despite setbacks and controversy over human rights and foreign intervention, the humanitarianism movement inched forward in 2005 with unanimous support in the UN General Assembly for the responsibility to protect (R2P) doctrine. R2P reframed the 1990s right to intervene in terms of a state's responsibility to protect citizens from genocide, war crimes, ethnic cleansing, and crimes against humanity. The R2P framework championed diplomatic and economic measures to prevent or mitigate conflict, but if necessary, foreign states could utilize military force as a last resort to protect civilian populations from violence. While R2P meant to reframe the past's right to intervene, the debate over the efficacy of intervention remained as contentious as ever.

The 2000s were also marked by numerous natural disasters where the international community rushed to the aid of the distressed in noncombat environments. Similar to the past, military forces spearheaded aid efforts with their unmatched logistical capabilities to transport supplies in hard-to-reach areas. Critical civil affairs detachments, particularly from the United States, assisted in a variety of logistical capacities—transporting supplies and nongovernmental organization (NGO) personnel, restoring crucial public services, and preserving law and order. Although the often overwhelming presence of military force created tension for some NGOs, military forces have shifted policy to extract themselves as soon as they transfer the mission control to peacekeepers or domestic governments. Conversely, NGOs that have been crucial in advancing human rights since the foundation of the United Nation had also grown exceptionally adept at delivering assistance in difficult environments. Disaster relief efforts in Indonesia, Myanmar, Haiti, and Pakistan also evidenced an erosion of borders as nations welcomed assistance from nations and organizations across the globe. Some controversy sprang from Myanmar's initial rejection of aid in 2008 after Cyclone Nargis prior to UN negotiations that opened the country to NGOs. Even though R2P did not include provisions for disaster relief, the French foreign minister Bernard Kouchner called for the United Nations to invoke R2P to assist disaster victims in Myanmar. Overall, the

openness to disaster relief indicated that antipathy to intervention surrounding the Iraq War had not spread to natural disaster relief.

With the United States fully engaged in Iraq and Afghanistan, other leading states in the international community supervised multiple humanitarian intervention missions throughout the decade. In 2008, the international community invoked R2P for its first use in a UN campaign that calmed escalating violence surrounding elections in Kenya. Elsewhere in Africa, civil wars were ended through decisive application of force by England in Sierra Leone and France in Côte d'Ivoire. Australia also deployed force in a UN intervention in East Timor after the region seceded following years of conflict with U.S. ally Indonesia.

In Sudan, the crisis in the Darfur region that began in 2003 demonstrated that even after a decade of increasing intervention, international action was not assured. As humanitarian aid and faith-based non-profits galvanized popular concern over the violence, African Union and UN peacemaking and peacekeeping efforts fell short of decisive action. The absence of conclusive action demonstrated that opposition from the Sudanese government and lack of political will-power among intervening parties could easily drown public outcry over genocidal violence. The violence in Darfur also symbolized the growing tendency of liberal humanitarians to side with conservatives on the application of military force to resolve humanitarian crises. As the outcry cooled in 2010, the experience reemphasized that politicians ultimately decided whether to intervene and where to do so, often paying the closest attention to geopolitical advantage.

Intervention in Libya and Beyond

In the wake of the Arab Spring, the international community joined behind the United States in the 2011 Libyan intervention. As Russia and China abstained, the United States moved under Operation Odyssey Dawn to establish a UNSC-approved no-fly zone and preempt a mass atrocity by Muammar Qaddafi. After a heavy U.S.-led bombardment, operations transferred to a NATO coalition led by Britain and France. Critiques of the mission's cooption of R2P as a tool of regime change occurred when NATO air strikes unofficially pursued Qaddafi. Contention in the United States also arose to challenge the constitutionality of intervention and President Barack Obama's leading from behind.

Ultimately, the transfer of control away from U.S. forces successfully removed American military might from the spotlight and empowered the multilateral force to continue the mission.

The future of humanitarian intervention after Libya remains just as uncertain and unpredictable as it did at the close of the Cold War in 1991. Anxious for the next chapter in the evolution of R2P, observers of international relations must wait to see if the precedent in Libya opens the door to similar regime change interventions elsewhere. Critics of the Kosovo intervention will undoubtedly also scour headlines in search of the Clinton Doctrine's manifestation in interventions that lack unanimous UNSC approval. Increasing financial constraints in an age of austerity have already influenced future defense spending cuts, which may also affect the calculation to intervene in global crises. If the history of humanitarian intervention serves as any indicator, the only certainty will be the continued debate over the efficacy of intervention and future of universal human rights.

HUNTINGTON, SAMUEL

Samuel Phillips Huntington (1927–2008), distinguished professor, political scientist, foreign policy analyst, and advisor, spent his career examining the relationship between the informal and formal structures of political institutions and developing theories for understanding issues confronting U.S. national interests. Periodically active in politics, Huntington was a speechwriter for Adlai Stevenson in 1956 and an advisor for Hubert Humphrey's unsuccessful presidential campaign in 1968. From 1977 to 1978, he was a consultant for the National Security Council during the Carter administration and served as a strategic advisor to President Ronald Reagan in the 1980s. Huntington is best known for the controversial arguments put forth in an article titled "The Clash of Civilizations?" wherein he suggested that post-Cold War conflicts would predictably escalate along specific "cultural fault lines." Of the eight civilizations listed in his global paradigm, the most volatile borders stood between the West and the Islamic civilizations. After its initial publication, Huntington remarked that this theory had stirred more debate than anything else he had written. Yet his 60-year academic career was never far removed from the controversies of his day. As a political theorist, he was apt to provide a conceptual framework for understanding the origins of political crises and revolutions. For the purposes of this entry, his scholarly achievements will be categorized into four major areas of interest: (1) civil-military relations, (2) political development, (3) post-Cold War paradigms, and (4) challenges confronting American national identity.

Civil-Military Relations

Huntington's first major work, *The Soldier and the State* (1957), was precipitated by the constitutional crisis and public disagreement between President Harry S. Truman and General Douglas MacArthur over the direction of the Korean War (1951–1953). President Truman's firing of General MacArthur in 1951 raised important questions about the appropriate limits of civilian control and military expertise during armed conflict. Huntington had himself served in the U.S. Army during a period of immense institutional reform following the passage of the

National Security Act in 1947. *The Soldier and the State* is at once a history of American and European civil-military relations and a framework for understanding problems associated with civilian control of the military in the context of the delicate political environment produced by the advent of the Cold War (1949–1991) and the introduction of the atomic bomb in the aftermath of the Second World War. Huntington identified long- and short-term causes for the constitutional crisis presented by General MacArthur's appeal to Congress and the American public when President Truman declined to abide by his recommendation to escalate the Korean conflict. Historically, and up to the period of the late 19th century, military officers and political leaders shared a common social and cultural milieu. When the U.S. Constitution was drafted, the overriding concern for its 18th-century framers was limiting the power of the central government and the chief executive who, historically, had been most inclined to use war as a pretext to tyranny. Article 1 Section 8 of the Constitution gave Congress the power to declare war, and Article 2 Section 2 provided the president with the power to execute the war as commander in chief. This broad political control of the military in time of war assumed that the values and experience of political leaders and military officers were fundamentally the same, but this situation had changed by the end of the 19th century. Following the Prussian War theorist Carl von Clausewitz, Huntington understood the modern military to possess its own grammar and its own set of professional values apart from those of the ruling elite. The National Security Act of 1947 and 1949 had, in Huntington's view, realigned and corrected the intrusive habits of military commanders in political affairs that characterized the conduct of the Second World War to better reflect the "Objective Civilian Control" of the military. The conduct of the Second World War had required a multinational war effort, which ceded many of the ordinary civilian controls to the professional expertise of military commanders under the general political objective that called for the unconditional surrender of Germany and Japan. This "Subjective Control" of the war invited military commanders to comment on and participate in those functions normally reserved to their civilian leaders. In Huntington's view, this created a culture within the military officer corps typified by General MacArthur's public criticism of President Truman and incompatible with the delicate

diplomacy required by the Cold War. Huntington observed and recommended the progression toward *professionalization* where distinctions of function are employed to channel and minimize military involvement in policy making through the Joint Chiefs and the Department of Defense, thereby eliminating the need for direct presidential censure.

Huntington's scholarship inaugurated the academic study of civil-military relations, and his ideas remain especially prescient since the Korean War, the first of several American wars that were never formally declared by Congress. Since that time, the locus of authority in defining political objectives has been a closely guarded prerogative of the president and his cabinet. As recently as 2009, 1 year after Huntington's death, General Stanley McChrystal was named commander of the North Atlantic Treaty Organization mission in Afghanistan due in part to his willingness to state frankly his professional military opinion to his civilian superiors. General McChrystal's resignation in 2010 for comments published in *Rolling Stone* critical of his civilian commanders reflects ongoing tensions between military expertise and civilian-controlled policy objectives. The framework outlined by Huntington admits that the spheres of professional military expertise and the expectations of civilian leaders would occasionally come into conflict. But as McChrystal noted in his letter of resignation to President Barack Obama in characteristically Huntingtonian terms, his public criticisms had violated the traditions of military professionalism but not necessarily the limits of military expertise. These military "values" (as opposed to laws) cited by McChrystal, and recommended by Huntington half a century earlier, sought to inculcate a culture of professionalism that at once encouraged candid guidance in military affairs and respectful deference to civilian authorities.

Political Order and Development

Huntington's most systematic study of the relationship between political institutions and society was undertaken in his 1968 book, *Political Order in Changing Societies*. In this work, Huntington examined the patterns of economic modernization and political reform over the past 2 centuries to understand the challenges faced by emerging economies in the context of the Cold War. The transition from traditional to modern societies historically required

a significant redistribution of political power away from local or feudal sources, toward a centralized and bureaucratic polity. Modernization, the transformation of a traditional and oftentimes agrarian society into an industrialized and urbanizing society, destabilizes social order if pursued too quickly. Citing several European examples, Huntington argued that political order was in large part dependent on maintaining legitimate political institutions in the face of significant social changes. The degree of government had to be strengthened before effective changes in the kind of government could be effectively implemented, a thesis that challenged prevalent notions about the partnership between economic modernization and the expansion of democracy. The backdrop of the Cold War cannot be overstated here, as it was generally understood that maintaining political legitimacy and stability was vital to stemming the worldwide spread of communism. His thesis was further developed in *No Easy Choice* (1976), a work that introduced political participation as an independent variable in the modernization process. Accelerated modernization, he warned, introduces elements of political instability that often outpace a government's ability or willingness to reform. After a "third wave" of democratization in Latin America yielded a disappointing turn back to authoritarianism, Huntington amended his thesis again in *Understanding Political Development* (1987) to account for the apparent inverse relationship between economic growth and social equality during the initial phases of industrial and economic development. The modernization of Latin America had yielded unexpected political developments: rapid economic development, initial wealth inequality, followed by a surprising resurgence of authoritarian governments that sought to curtail the same wealth disparities that brought new political classes into power. Rather than associating political instability with economic underdevelopment and poverty, Huntington argued that the process of rapid modernization itself had destabilized society by delegitimizing political institutions, causing discord followed by political repression. These initial phases of modernization were well documented. What was not foregone, however, was how differently nations would adapt to the social consequences of modernization. The success or failure of a nation to politically metabolize economic development depended in large part on its culture, defined as shared values.

By the late 1980s, Huntington joined other scholars who included “culture” as the most significant variable in predicting the shape of political developments in modernizing economies. This insight marked a shift in Huntington’s scholarly interests thereafter.

Post–Cold War Paradigms

Huntington’s 1993 article, “The Clash of Civilizations?” borrowed its title from Bernard Lewis’s article, “The Roots of Muslim Rage.” Lewis had argued that the next global threat to the United States would emerge from the “Islamic world,” where cultural hostilities had been nurtured by the perceived failure of Arab nations to keep pace with Western development. Huntington seems to have accepted the presumptions and the theoretical utility of this claim, even as he viewed it as an undesirable condition. In Huntington’s paradigm for the post–Cold War world, the “Islamic civilization” was one of eight cultural groupings that also included Western, Confucian (or Sino), Japanese, Hindu, Slavic-Orthodox, Latin American, and African. In each of these, religion and language assume the responsibility of cementing social bonds and shared national interests. In Huntington’s view, the nation-state would remain diplomatically significant but formerly “Third World” national interests would come to be influenced by their civilizational alignment displacing their Cold War allegiances. Civilizational divisions, concealed by the political spheres of the Cold War, began to resurface in the early 1990s. This paradigm provides the basis for understanding the instability that followed in many parts of the world after the collapse of the Soviet Union. These include shifting allegiances in Central Asia, the Balkans, central and southern Africa, and nations that “bestride cultural fault lines.” Huntington insisted that this paradigm provided the best explanatory model for understanding and predicting post–Cold War conflicts. While the Islamic world represents only one such group, he, like Lewis, claims it has particularly “bloody borders” with the West. To his critics’ objections, he responds that his view offers a realistic model that explained existing perceptions for both Muslims and Westerners. The “clash” theory remains salient to this day, despite many attempts to discredit its assumptions of shared values between widely diver-

gent nations. Huntington defended the utility of his civilizational divisions on the pages of *Foreign Affairs* and in later publications throughout the 1990s, but the 9/11 attacks did more to propel his theory into the public consciousness than any other event. Less controversial aspects of this thesis include predictions of growing animosity between the United States and China and the rise of religious faith as a counterweight to globalization.

American Identity

Huntington’s turn to culture as an explanatory variable in political development continued to animate his scholarly interests through the last decades of his life. When applied to American political institutions, the preeminence of religion is more difficult to discuss, given its legal disestablishment from government. Nevertheless, American political development, he observed, had been characterized by the periodic arousal of “creedal passions,” exemplified most poignantly during the Revolutionary War, the Jacksonian reforms of the 1820–1840s, the Progressive Era from 1890 to 1914, New Deal legislation in the 1930s, and the civil rights movement of the 1960s. These periods of “creedal” reform represent concerted attempts to close the gap between American *institutions*, such as voting, education, or labor, and the American *ideals* of

Samuel Huntington, during a panel discussion titled “When Cultures Conflict” at the 2004 World Economic Forum in Davos, Switzerland.

liberty, opportunity, and equality. Huntington argued in *American Politics* (1981) that in each of these periods, changes were ushered in by religious awakenings animated by the implicit moral perfectionism of Anglo-Protestant culture. In some cases, the awakening stretched the defining characteristics of American identity to include “other” groups such as non-property-owning residents, women, and Black Americans.

The integration of Hispanics, however, represented a departure from earlier patterns for a variety of reasons noted in an article and a second book-length work on the subject titled *Who Are We?* (2004). Changes in U.S. immigration policy since 1965 had led to an influx of Latin American immigrants to the United States, most prominently witnessed in an influx of illegal immigrants from Mexico. Unlike other immigrant groups, Mexicans came in disproportionately large numbers, have a historical claim to U.S. territory, and refused to assimilate according to the pattern of other immigrants to the United States. The refusal of Hispanics to adopt American values, he argued, threatens the credibility of American legal and political institutions. As these values become increasingly diluted by the introduction of an Hispanic culture unwilling to adopt these values, they lose their power to animate Americans to reform their society into a more perfect state of freedom, thus challenging the potency of American patriotism. Huntington (“American Ideals,” 1982, p. 9) asks, “Would an America without its Protestant core still be America?” Citing the correlation between religious awakenings and “creedal passion periods,” Huntington concludes that the loss of the American creed would necessarily threaten national unity and the efficacy of its political institutions unless the tide of Hispanic immigrants is deliberately slowed. His views were met with accusations of nativism but should be understood in relation to earlier works that privileged the importance of cultural values as underpinning effective political institutions. Other critics challenged his premise, citing numerous examples of Hispanic assimilation, including rates of English literacy, the loss of Spanish literacy in successive generations, and the frequency of intermarriage.

Conclusion

If a single thread can be shown to run through Huntington’s scholarly pursuits, it is his observation

that informal social structures and values form the foundation for the success of legal and political institutions. He prioritized political legitimacy as a necessary and prerequisite condition for effective government. His commitment to democracy was second to, and entirely contingent on, the stability and credibility of existing political institutions. Increasingly, he came to insist that these institutions demanded the mediation of shared cultural values and credible political institutions capable of adapting to changing social conditions—an insight noted in his first book, *The Soldier and the State* (1957), and in his last, *Who Are We?* (2004). This thread unavoidably ignores many of his scholarly interests, characterized by their hard-nosed commitment to political realism and the utility of general theories for strategic planning and public policy. The questions raised and policies recommended over the course of his academic career invoked the ire of many in the academic community for their impact on U.S. strategic planning from the Vietnam War to the Global War on Terrorism. Huntington was twice rejected from the National Academy of Sciences for his early support of American intervention in Vietnam and has since suffered personal and professional rebukes for his “hawkish” attitudes toward East Asia and the Middle East. His own view, however, often stood in contrast to the interventionists who cited his “political realism,” and who often sought to steer U.S. foreign policy in directions Huntington himself opposed. While working for the State Department during the Vietnam War, he was critical of U.S. policy for its reliance on military solutions to complex political and religious problems. Similarly, after a spirited defense of his clash thesis, he opposed American intervention in Iraq in 2003 and publicly supported the antiwar presidential candidate Senator John Kerry in 2004. His commitment to the utility of grand ideas to explain geopolitical realities may have invited controversy, but this does not detract from the credit he deserves as the instigator of some of the most significant foreign policy debates over the past half century.

See Natural Disaster, Military Response to

INDIA

In 1947, Pakistan and India as independent nations came into existence. After independence, India followed a sort of state socialism. From the 1990s, the globalization policy of the Narasimha Rao government and successor regimes has not been able to totally convert the state-directed mixed economy into a full-fledged market economy. India's population (1.2 billion) is next only to China's. India is industrializing rapidly; still, 70% of the population remains employed in the agricultural sector. In 2012, the projected growth rate was 7%. This entry describes the foreign policy of India and discusses India's military forces, alliances, and territorial disputes and wars with Pakistan.

Foreign Policy

Due to Jawaharlal Nehru's (India's first prime minister, 1947–1962) policy of “nonalignment,” India refused to align itself with any extraregional powers. However, modern research is pointing to the fact that Nehru, when required, was not above using the threat of force. One finds an admixture of liberal values and a realist outlook in Nehru's foreign policy. At times, he favored coercive rather than controlling strategies. His innate circumspection in the exercise of “raw” power led him toward an incremental approach in managing crises. The break in India's grand strategy occurred in 1971, when Nehru's daughter, Prime Minister Indira

Gandhi, signed the Treaty of Peace, Friendship, and Cooperation with the USSR. This resulted in the Third India-Pakistan War in late 1971 (see the section Conventional Wars). The Indira doctrine was enunciated in 1983. It clarified that India had a right to intervene in the internal affairs of the neighboring countries if disorder threatened to spill over from the confines of the affected country. India claimed that it would not tolerate any intervention by an outside power. If any external help was required for meeting any internal crisis, the affected state must look to India for aid. In 1987, Prime Minister Rajiv Gandhi (Indira's son) intervened in Sri Lanka because the ruling Congress Party could not overlook the public opinion in Tamil Nadu due to killing of the Tamils by the Sinhalese. Second, Sri Lanka's attempt to acquire the support of foreign countries for modernizing its armed forces and the possibility of the port of Trincomalee being made available to the United States accelerated India's decision to send the Indian Peace Keeping Force. In total, three infantry divisions and other combat arms elements fought in Sri Lanka against the LTTE (Liberation Tigers of Tamil Eelam). However, the succeeding V. P. Singh government withdrew the force. The collapse of the USSR and the rising power of China forced India to seek a rapprochement with the United States. The George W. Bush and Obama administrations and the two succeeding Congress governments under Prime Minister Manmohan Singh accelerated the emergence of a strategic alliance between the world's two largest democracies in 2009.

Armed Forces

The British introduced the regimental format, and the Indian and Pakistan armies retain it. The Indian army is a long-service volunteer force numbering about 1.1 million and represents the third largest in the world. In the India-Pakistan wars, the Indian army carried the main burden (refer to the section Conventional Wars). Its chief duty is to guard the 15,000-km land border. In Afro-Asia, the Indian Air Force (IAF) is next only to China's. Besides the Russian Sukhoi-30, the IAF at present is looking for fighter-bombers from West Europe and the United States. India is on the way to acquiring Dassault Rafale aircraft from France. For guarding the 7,600-km coastline, the Indian navy maintains one aircraft carrier and is in the process of acquiring *Admiral Gorshkov*, an aircraft carrier from Russia. Furthermore, New Delhi is planning to commission a nuclear submarine.

Conventional Wars

Pakistan's ambition to incorporate Kashmir started the First India-Pakistan War. On October 22, 1947, Pakistan sent troops to capture Kashmir. On October 27, 1947, India decided to intervene militarily in Kashmir. On December 31, 1948, during the cease-fire, the Indian army held two thirds of Kashmir.

In October 1950, the People's Liberation Army entered Tibet and threatened the 5,000-kilometer-long Indo-Tibetan border. Furthermore, China refused to recognize the McMahon Line (the border between India and China). During the late 1950s, China violated India's territory in Ladakh while building a highway through Aksai Chin. On October 19, 1962, China launched a limited offensive against India in Ladakh and in Arunachal Pradesh. After destroying one Indian army brigade, Beijing unilaterally declared a cease-fire on November 21.

There is a debate about the dates of the beginning of the Second India-Pakistan War. While some Indian analysts claim that the war began with the Rann of Kutch incursion (April 24, 1965) by Pakistan, other scholars argue that the war started with the launching of Operation Gibraltar (August 1965). This debate notwithstanding, on September 5–6, 1965, Pakistani dictator Field Marshal Ayub Khan launched a strike on India using military equipment provided by the United States. This Pakistani

attack initiated the general onset of hostilities. In response, India retaliated at Punjab. The greatest tank battle between India and Pakistan occurred at Khem Karan, where the Indian Centurions trounced the Pakistani Pattons. In the air, Indian Vampires proved superior to American Saber jets flown by Pakistani pilots. Nevertheless, it could not be denied at the tactical level that in many cases the handling of military assets by the Indian military officers fell far short of the required standard. For instance, the IAF lost more aircraft than the Pakistan Air Force. The Indian army berated the IAF for failing to provide timely close air support. And in the Western Command, several Indian infantry battalions ran away when faced with the superior firepower of Pakistani ground units. India's Ichogill Canal offensive was a total failure. However, India was able to hold its own by its sheer size and numerical superiority. Through Soviet mediation, the cease-fire came into existence on September 23, 1965.

In 1971, India took advantage of the rebellion in East Pakistan against West Pakistani domination to start the Third India-Pakistan War (for India's aggressive foreign policy under Indira Gandhi, see the section Foreign Policy). The IAF gained air superiority over East Pakistan, and the aircraft carrier of the Indian navy gained sea control in the Bay of Bengal. The Indian army marched to Dacca, and the 45,000-strong Pakistani army under General A. A. "Tiger" Niazi in East Pakistan surrendered. East Pakistan became an independent country known as Bangladesh.

Civil-Military Relations

The Indian military establishment remains subordinate to the elected politicians. After independence, the salaries and status of military officers were reduced vis-à-vis civilian bureaucrats and police officials. Political interference regarding promotions in the higher ranks of the army during 1960–1962, under Defence Minister Krishna Menon, resulted in civil-military trouble. From then onward, politicians took care never to micromanage the army. Also, civilian bureaucrats of the finance ministry control military expenditure. Under Nehru, 2% of the gross national product was devoted to the military establishment. In the 1980s, under Rajiv Gandhi, defense expenditure amounted to 4% of the gross national product. However, succeeding governments

reduced defense expenditures to 2.5% of the gross national product.

Counterinsurgency

India maintains about 300,000 soldiers in Kashmir, both to check Pakistani-sponsored insurgents as well as to deter the Pakistanis from crossing the border. In northeast India, another 30,000 soldiers are deployed against the Nagas. To balance the army, the home ministry controls the paramilitary forces, which number 1.2 million.

Nuclear Policy

In reaction to the 1971 defeat, Pakistan in 1972 decided to acquire nuclear weapons to balance India's conventional superiority. Aid from China and North Korea enabled Pakistan to manufacture nukes. The hardening of the U.S. stand on the Non-Proliferation Treaty forced India to declare itself a nuclear power. The nuclear parity encouraged Pakistan in May 1999 to launch a limited conventional strike with two brigades in Kargil. The Kargil war came to an end with mediation by the Clinton administration. To bolster its nuclear defense, India is negotiating with Russia to buy a mobile anti-ballistic missile system.

INDIAN WARS

From the founding of the Early Republic until the 1880s, the U.S. Army was involved in a series of conflicts with Native American tribes throughout the country. Armed conflict between Native Americans and White settlers in the present-day United States emerged as soon English settlers arrived on the continent in the late 1500s and continued until the last Indian tribes were subdued and forced onto reservations in the 1880s.

White expansion fueled most of the Indian Wars. The forced expulsion of most southeastern Indians to territories west of the Mississippi represented a crucial turning point in Indian-White relations. These actions took place under the Indian Removal Act of 1830s and resulted in the creation of an "Indian Territory" primarily in present-day Oklahoma. Until the Civil War, much of the Western Plains was deemed unsuitable for settlement, but this would change as a result of the Homestead Act of 1862, which provided free land to settlers willing to establish working farms; the discovery of gold and other precious minerals suitable for mining in places such as the Black Hills of South Dakota; and the completion of a transcontinental railroad in 1867, which sparked a flood of White westward migration. Native American resistance to this encroachment resulted in bloody conflicts with the U.S. Army as it sought to implement a policy that called for all Indians to live on reservations.

Pre-1865 Indian Wars

From the earliest period of European contact, interactions with Native Americans almost inevitably led to armed conflict, and Whites often forcibly dispossessed Indians from their lands. Technological advantages, most notably firearms, did give an advantage to English and other European colonialists in subduing Native American tribes that populated what became the 13 colonies of British North America. Diseases like smallpox also played a pivotal role in reducing Native American populations, in many cases even before the onset of permanent European settlement. Colonial Pennsylvania, founded by William Penn, stands as an exception to this pattern, initially relying on peaceful purchase of land from the tribes.

Initially, European and Native American conceptions of war differed markedly. European colonialists came from societies that waged wars marked by brutality, especially the religiously inspired conflicts between Roman Catholics and Protestants in the 1500s and 1600s. Native American tribes generally placed limits on the violence used in war and seldom sought to destroy their opponents. For Native Americans, participation in war often served as a rite of passage and an opportunity to display courage. Captives taken in war could be tortured and killed, but they were often spared and adopted into the tribe that captured them. Most Native American tribes had much more egalitarian forms of political organization that limited the power of chiefs and did not have European conceptions of private property.

Ironically, the initial colonial English settlements in Virginia and New England could not have survived without Native American assistance. Trading opportunities offered many tribes the opportunity to acquire European technology, most notably firearms and iron products. However, conflict arose from the almost insatiable quest of the English settlers for more land. In the case of Virginia, the Powhatan Confederacy under the leadership of Opechancanough sought to halt English settlement by launching two major wars in 1622 and 1644. In the first, the Tidewater War, Opechancanough succeeded in killing approximately 25% of the colonial population in the opening hours of the conflict. The Virginia colony survived this 10-year war in part because the colonists enlisted the aid of an Indian ally, the Potomack Tribe. In 1664, the demographic tide of English migration combined with the killing of Opechancanough to end any possibility of ultimate Native American victory.

Total war in New England was initiated by the Puritan colony of Massachusetts during the Pequot Indian War. To destroy the Pequots and seize their land, the Puritans and their Indian allies launched a surprise attack on the Mystic Fort Pequot settlement in 1637. To the dismay of their allies, the Puritans totally annihilated the tribe, killing men, women, and children in the assault on the village, and sold the few survivors into slavery in the Caribbean.

The even more destructive King Phillip's War (1675–1676), also known as Metacom's War, emerged from tensions regarding colonists' expansion westward and ongoing attempts to assimilate Native Americans into colonial society. Sparked by

the apparent murder of a Harvard-educated and Christianized Indian, the war pitted a coalition of Native American tribes against New England's White settlers in an effort to end the colonies' westward expansion and regain autonomy. The Indians attacked more than half of New England's towns and killed almost a 10th of the colonial population. Ultimately, the colonists won a hard-fought victory following a brutal war of attrition. The war confirmed British colonists' hold on eastern Massachusetts and dramatically reduced the Native American population in the territory. Perhaps more important, the war solidified colonists' perceptions of Native Americans as savages unfit for assimilation into colonial society.

Tensions over Indian conduct often divided colonial society. In 1676, Bacon's Rebellion pitted the Virginia colonial elite against colonists on the frontier. Led by Nathaniel Bacon, a force of back-country farmers, indentured servants, and some slaves marched to Jamestown to overthrow the colonial government, in part because of the refusal of Royal Governor George Berkeley to authorize an attack on all Indians. The rebels burned Jamestown to the ground and killed large numbers of Indians on the frontier, but the rebel forces ultimately dissipated following Bacon's death from disease, probably dysentery. A similar conflict emerged in 1763 in Pennsylvania when those on the frontier, the "Paxton Boys," began killing peaceful Indians under the protection of the Proprietary Government in retribution for attacks by other Indians. The Paxton Boys even marched on the colonial capital of Philadelphia in 1764 before a settlement was negotiated by Benjamin Franklin.

Indian tribes geographically distant from the coast had greater agency and more control of their destiny until the 19th century. The imperial struggle between England and France for dominance of the North permitted Native American tribes to form alliances with one another and competing European rivals. Between 1754 and 1763, French forces allied themselves with various northeastern tribes in the French and Indian War, part of the larger European Seven Years' War. Several Great Lakes tribes joined in Pontiac's Rebellion (1763–1765), seeking to expel the British, who had taken over land that had been settled earlier by the French. Native Americans took control of eight forts. About 450 British regulars and colonial troops died before the conflict ended.

This rebellion led the British to diffuse future Indian-colonial conflict by enforcing the Royal Proclamation of 1763, which limited settlement in the western lands acquired from the French. This effort, which aggravated British colonists' desires to push westward for new territory, formed a key contributing cause to the American Revolution.

During the American Revolution, many Native Americans remained loyal to the British Crown. In 1777, the British military commander in Detroit encouraged Indian allies to attack American settlements in Kentucky. In response, George Rogers Clark took a small force and captured several British forts in the Illinois territory in 1778, but they lacked sufficient forces to take Detroit. Clark's expedition did not eliminate the continued Indian attacks, but it played a role in ensuring that the fledgling United States would be granted this territory in the peace settlement that ended the Revolutionary War.

The Revolutionary War divided the Iroquois Confederacy; four tribes remained loyal to the Crown, while two sided with the United States. Joseph Brant, leader of the pro-British Iroquois forces, forged a military alliance with the Tories in the New York and Pennsylvania frontier regions and destroyed a number of American settlements in Wyoming Valley. To end this threat, in 1779, George Washington dispatched an expedition under General William Sullivan that managed to win a victory over the Iroquois and their Tory allies at the Battle of Newton. Sullivan did not eliminate the threat altogether, but further Iroquois attacks did not have strategic significance.

Timing played a significant role in neutralizing the threat to the fledgling United States posed by southeastern tribes. In May 1776, the Cherokee launched a major attack, which was suppressed by militia forces from the Carolinas and Georgia. Britain lacked the forces to offer direct military assistance for several years. When the British did successfully conquer most of Georgia and South Carolina in 1780, Indians' support for the British had diminished.

Although Britain granted the newly independent United States vast tracts of land that stretched to the Mississippi River, the British continued to maintain alliances with a number of Indian tribes in the Old Northwest (present-day Ohio, Indiana, Illinois, Wisconsin, and Michigan). In 1791, George Washington deployed a major expedition under General Arthur St. Clair to assert American

sovereignty in the Old Northwest Territory, but the effort ended in defeat. In 1794, at the Battle of Fallen Timbers, General Anthony Wayne decisively defeated the British-allied Delaware and Shawnee.

The Treaty of Greenville, which ended this conflict, encouraged a massive migration of American settlers to the Old Northwest. The Shawnee Chief Tecumseh sought to halt these gains by forging a Pan-Indian confederation in the Old Northwest. This alliance suffered a major blow when William Henry Harrison won a crucial victory against the confederation by attacking the village of Tippecanoe. The struggle with Tecumseh's confederacy ultimately became entangled with the War of 1812 and ended in 1813 with the death of Tecumseh, Native American defeat, and U.S. control of the Great Lakes region. A charismatic leader inspired by religious visions, Tecumseh's influence spread to other regions even after his death, and subsequent Creek resistance would in turn influence the Seminole cause of later years.

During the War of 1812, General Andrew Jackson dealt a powerful blow to the Creek Indians at the Battle of Horseshoe Bend in 1814. In 1818, Jackson invaded West Florida and crushed Seminole forces west of the Suwannee River. As president, Jackson played a central role in redefining American Indian policy. In 1830, a divided Congress passed the Indian Removal Act, authorizing the funds necessary for President Jackson to negotiate treaties of removal with all tribes living east of the Mississippi River. The Jacksonian-era removal policy sought to establish an Indian Country in territories west of the Mississippi River and undertook massive forced migration of southeastern Native American populations in what became known as the "Trail of Tears." These Native Americans experienced enormous suffering, disease, and loss of life in the process, particularly the Cherokee.

The most significant resistance to Indian removal took shape in the form of the Second Seminole War. In what proved to be a long, bloody conflict in the Florida swamps, the U.S. Army eventually developed new tactics to handle guerrilla warfare and inhospitable terrain. In the end, the U.S. Army and the federal government abandoned efforts to completely expel all Seminoles from Florida. A Third Seminole War (1855–1857) almost completely destroyed the remaining population in Florida, but even after this conflict, the federal government remained unable to expel all Seminoles to Indian Territory.

In the Southwest, during the 1830s and 1840s, army cavalry units along the Santa Fe Trail fought tribes such as the Comanche and Apache in a context complicated by increasing tensions with Mexico. After the annexation of Texas and the conclusion of the Mexican-American War, the army was faced with immense new swaths of territory to patrol, coinciding with the escalation of Indian resistance in most territories west of the Mississippi. Like the Sioux in the Plains region, in the Southwest, the Navajo and Apache put forth consistent resistance in the years leading up to the Civil War. In the Pacific Northwest, most Indian populations were decimated and placed on reservations in Washington by the U.S. Army following a series of wars in the 1850s.

Militia forces tended to deal with Native Americans more brutally than the U.S. Army. One of the worst massacres committed by militiamen occurred at Sand Creek in 1864 when a Cheyenne village was ruthlessly attacked by Colorado militiamen. Under the leadership of Colonel John Chivington, militia forces killed more than 200 Cheyenne in cold blood, primarily women and children. This incident sparked a major uprising among the Cheyenne and other Plains Indians.

Post-1865 Indian Wars

Conflict with Native Americans expanded dramatically after the Civil War due to a number of changes within the United States. Increasing White settlement west of the Mississippi challenged the prewar definition of that area as “Indian Country.” The postwar completion of a transcontinental railroad enabled major migration to those areas, a venture that before the war had been largely limited to traders, Mormons, and migrants on westward trails like the Oregon and Santa Fe. Indian policy shifted in response, with the ultimate goal of placing all Native Americans on reservations. Army campaigns in this era often centered on forcing Indians onto designated reservations or forcing their return to them. Some Indians fiercely resisted these attempts. For instance, Chief Joseph led the Nez Percé on an ultimately unsuccessful 1,500-mile trek through parts of Idaho, Wyoming, and Montana in an effort to reach Canada.

The 1862 Homestead Act had generated an explosion of migration west of the Mississippi. Even Indian Territory (present-day Oklahoma) was

opened to settlement in 1890. Massive numbers of settlers poured into the Great Plains, which had already experienced White encroachment during the gold rushes in the 1850s. The completion of the transcontinental railroad in 1869 furthered migration and tied this region to national and global markets. Global demand for bison pelts led to the virtual extinction of these animals in this era, depriving the Sioux and other Plains Indians of a vital resource.

In the West and Southwest, Generals George Armstrong Custer and Philip Sheridan utilized many of the same strategies as had Sherman and other Union leaders against the Cheyenne, Arapaho, and Comanche peoples. As with Sherman and the Sioux, winter campaigns in Texas and Oklahoma were waged to decimate friendly and unfriendly tribes alike. By aiming to eliminate the Indians’ access to vital resources during the winter, the army was able to systematically defeat, exterminate, or place tribes on reservations. The decimation of buffalo herds and the winter campaign of the 1874–1875 Red River War proved crucial in subduing the Cheyenne.

The Sioux and their allies fought tenaciously for their land. Led by Red Cloud, in 1866 the Sioux and their allies launched a series of attacks on isolated outposts on the Bozeman Trail leading to present-day Montana. The annihilation of Captain William Fetterman and his small 80-soldier unit—the so-called Fetterman Massacre—formed Red Cloud’s greatest victory, enraging General William T. Sherman, who subsequently advocated a harsh military campaign against the Sioux. In 1868, Sherman led a winter campaign against the Sioux, attacking them when they were most vulnerable. Red Cloud and his people experienced a brief period of triumph, and under the 1868 Treaty of Fort Laramie, U.S. Army forces abandoned the Bozeman Trail, and the Sioux were granted portions of Montana and the Black Hills in Dakota in perpetuity. This victory proved short-lived, however, as the discovery of gold in the Black Hills led to the outbreak of the Great Sioux War of 1876–1877. The Sioux and their Indian allies resisted U.S. Army efforts to place them on reservations and force them to abandon the Black Hills. The army responded by mounting an expedition to force these Native Americans onto reservations.

This effort culminated in the Battle of the Little Bighorn, one of the worst disasters for the U.S. Army in the post-1865 campaigns against the Indians. Most western campaigns of this era were skirmishes

involving small groups of Indian warriors and soldiers. The Battle of the Little Bighorn is remarkable for the size of the force assembled by Sitting Bull and Crazy Horse: more than 2,000 warriors. General George A. Custer, one of the most controversial generals of his era, attacked the Sioux and Cheyenne encamped near the Little Bighorn River, dividing his command into three units. Custer's cavalry companies were annihilated by warriors under the leadership of Crazy Horse. Custer's remaining units, commanded by Major Marcus Reno and Captain Frederic Benteen, suffered heavy casualties. This Indian success would be short-lived. Following another winter campaign, Sioux resistance was crushed as Sitting Bull fled into exile in Canada and Crazy Horse surrendered.

The final bastion of Indian resistance was in the Southwest. The more sedentary Navajo acquiesced to federal authority. The Apaches, however, resisted U.S. power until 1886, aided by guerrilla tactics, for which the army had no cohesive strategic preparation. Fighting in some of the most inhospitable terrain on the North American continent, the U.S. Army was forced to deploy thousands of troops to subdue the Apaches.

As the 1870s drew to a close, the Nez Percé and other Western Indian nations gradually fell to the annihilation strategy of the U.S. Army; further Army-Indian conflicts took place on a significantly smaller scale. Apache resistance finally died out as well, and with it the end of organized Native American opposition to U.S. rule.

The defeat of Native American forces led to the messianic Ghost Dance movement in a number of Plains Indian reservations. Fears of another uprising subsequently led the army to dispatch a force under Major General Nelson A. Miles to the Sioux Reservations in the Dakotas. At the highly controversial Battle of Wounded Knee, army personnel were accused of massacring scores of Indians, including women and children. The Battle of Wounded Knee marked the last significant army engagement with Native Americans. Although army units would remain posted in the Far West into the early 20th century, their role policing the frontier would end.

Historical Lessons

Robert M. Utley represents perhaps the most authoritative scholar of Native American history, with numerous publications on the subject. Utley

points out that while the army usually experienced success in operations against Indians, the growth of the White population played a key role in undermining Native American power and influence. Economic and technological factors, such as the westward expansion of trade, mining, railroads, and agriculture, all played a role in aiding army operations against Native American tribes. As tribes lost land and agency, resistance became more difficult, and the establishment of a system of Indian reservations greatly diminished the autonomy of the once proud tribes.

During the 19th century, West Point offered no formal coursework addressing how to wage war against Native Americans. While constabulatory duties against Native Americans remained the principal mission of the U.S. Army until the 1890s, military education focused on preparing for a major land war against a European power. Army attitudes toward Native Americans were complex, with many wholeheartedly embracing ruthless conquest. At the same time, there remained a significant number of officers who, while following orders, expressed dismay at official policies they perceived to be unjust, especially with regard to the Trail of Tears. (For more information regarding the complexity of army attitudes toward Native Americans, see Leonard, 1974.)

Scholars also focus on an army Indian-fighting doctrine—or the lack thereof. The United States developed no formal doctrine for waging war against indigenous peoples, and yet it demonstrated itself able to achieve ultimate victory with a peacetime army that could only station a few thousand troops on the vast frontier. In the *American Way of War* (1973), Russell Weigley argues that the army's ability to wage winter campaigns played a crucial role in subduing tribes. He also highlights the completion of the transcontinental railroad and the virtual extermination of the bison as key factors enabling the army to force tribes onto reservations. In his influential 1983 article "Insurrectos: The U.S. Army Experience With Insurgency," John M. Gates connects the war against Native Americans to the war against Filipino nationals during the Philippine Insurrection of the early 20th century. Andrew J. Britle also emphasizes the army's long experience engaging in irregular warfare, often successfully, without a formal doctrine in *U.S. Army Counterinsurgency and Contingency Operations Doctrine, 1860–1941* (2001).

Although negative portrayals of Native Americans form one of the oldest genres of American history, there also exists a powerful trend emphasizing the injustices against Indians. For a classic account, see Helen Hunt Jackson's *A Century of Dishonor* (1881) and more recent works by Dee Brown (*Bury My Heart at Wounded Knee*, 1970) and Francis Jennings (*The Invasion of America: Colonialism, and the Cant of Conquest*, 1975). Efforts to highlight Indian agency represent a major theme of scholarship since the 1990s. For instance, throughout the colonial era and into the early 19th century, Native Americans could seek to ally with European powers. Richard White's work, most notably *The Middle Ground: Indians, Empires and the Republics in the Great Lakes Region, 1650–1815* (1991), has focused on this subject.

Conclusion

U.S. policies toward Native Americans shifted throughout the 19th century as the nation expanded. East of the Mississippi, the power and capabilities of many tribes were diminished either before the Revolutionary War or shortly thereafter. As a result, these tribes were unable to compete against the U.S. Army as fiercely as the nations in the west. The delay in the expansion of White settlement west of the Mississippi afforded Native Americans there more time to combat the U.S. presence, though their agency declined markedly after the end of the Civil War. The army's development of total-war strategies during the Civil War, official U.S. encouragement of White westward settlement, and technological and industrial progress after 1865 would prove to be a deadly combination for Native American nations.

INDIRECT FIRE

Indirect fire, simply described, refers to a method of weapon employment that does not rely on a direct visual observation of the target to engage it. Primarily contrasted with direct fire, which requires a visual line-of-sight to the target, indirect fire often engages targets obstructed by significant terrain features and foliage or targets beyond the horizon. As such, indirect fire relies on both a shooter and an observer/sensor. The observer identifies the target, and the shooter fires the weapon system in response. A technical system largely developed during the era of World War I, when communications technologies caught up with weapons capability, indirect fires, primarily from land-based artillery systems such as howitzers, mortars, and rocket launchers, are one of the means of attacking enemy forces in both offensive and defensive combat environments. This entry describes the indirect fire process and the use of indirect fire today, with a focus on its use in counterinsurgency operations.

Traditionally, since World War I, indirect fire systems have focused on improvements in the so-called five requirements for accurate predicted fire. These requirements—(1) accurate target location, (2) accurate firing unit location, (3) accurate ammunition and weapon information, (4) accurate meteorological information, and (5) accurate computational procedures—determine the precision with which targets are effectively engaged in geographical space (see U.S. Army Field Manual 6-40). In short, the more accurately these requirements are calculated prior to firing, the more precise and effective the fire will be on the target. The calculation of these requirements has traditionally been the purview of another aspect of the indirect fire system, the fire direction center. This center uses computations such as physics-based algorithms, combined with atmospheric and geographic data, to calculate a trajectory of the projectile from weapon to target. In cannon artillery, this trajectory takes into account interior, exterior, and terminal ballistics to accurately predict

before firing where the projectile will land. In summary, the indirect fire process typically consists of three parts: (1) the observer/sensor (the eyes), (2) the fire direction center or other computation means (the brain), and (3) the weapon delivery system (the brawn). When applied collectively using the five requirements for accurate predicted fire, the indirect fire process effectively engages enemy targets.

Along with precision, responsiveness, or the speed with which weapons systems engage enemy targets, has been a key to combat effectiveness. In contrast to the science and mathematics applications and computations involved in the calculation of ballistic trajectories, the experienced observer often achieves responsiveness by artfully estimating the time necessary to process the request for fire in order to deliver its effects at the right place at the right time, also known as time on target.

Technological developments in indirect fire have tended to focus on increasing its precision, responsiveness, range, and/or lethality. In the post-Cold War era, developments in artillery systems have included north-seeking gyros, Global Positioning System satellite receivers, and inertial navigation systems that when combined with automatic (on-board) fire control systems have provided individual artillery pieces with the capability to self-locate and self-calculate individual firing trajectories. Examples of these capabilities are the M109A6 Paladin Howitzer and M270 Multiple Launch Rocket System in the current U.S. Army inventory. These technologies have increased precision/accuracy and responsiveness.

In modern military organizations, officers who often are embedded within the staff of direct combat—often infantry or armor—formations are routinely required to plan indirect fires in support of operations. This staff, usually referred to as the fire support staff, is key to optimizing the combat lethality of its parent formations by accurately integrating all the possible effects achieved by the available indirect fire systems. This process has been typically referred to as “fire planning” and is conducted from the platoon through the highest levels of military organizations. In the implantation of indirect fires in combat, this staff also actively manages the indirect fire systems available and supervises their employment and synchronization.

Indirect fire systems have sometimes found it difficult to support operations in the counterinsurgency

environment. Most delivery systems were designed to fight on the conventional battlefield and focus their tactics and munitions on producing massed effects on an area target. Munitions such as dual-purpose improved conventional munitions and cluster bombs include scatterable submunitions that cover wide areas and are highly suitable to conventional battle, proving their effectiveness in Operation Desert Storm and the initial invasion stages of Operation Iraqi Freedom I. Those techniques and munitions do not transition well to counterinsurgency warfare due to the nature of area effects and the resulting collateral damage. Indirect fire management at the highest levels is now involved in elaborate planning and supervision structures designed to limit damage to a precise target location to prevent collateral damage to cultural artifacts or innocent persons. Indirect fire technologies have been leveraged and developed to support a precision strike capability. Formerly primarily the domain of air-delivered platforms, precision-guided munitions (often based on Global Positioning System or laser guidance) are regularly employed in the counterinsurgency effort in Afghanistan and, earlier, in Iraq from ground-based delivery platforms such as traditional cannon, rocket, and missile systems. These ground-based systems are more readily available and provide all-weather responsiveness, increasing the coverage area and flexibility for the use of indirect fires. These new munitions have significantly altered the traditional means of computing a ballistic trajectory and now highlight the increased importance of accurate target location for precision effects.

In recent U.S. Army combat operations, indirect fire has been attempted through modifications of its traditional missions. First, indirect fire systems have continued to perform “counterfire.” Counterfire is defined as a rapid indirect fire response to incoming enemy indirect fires. The U.S. Army is aided in this application through fire-finder radar technologies that have the capability to accurately locate the point of origin of enemy indirect fire systems. This acquisition capability allows for a rapid and accurate indirect response to enemy mortar or rocket attacks on friendly installations or positions. Counterfire has been used to limited effect in the conflicts in Afghanistan and Iraq, with some notable exceptions. These exceptions have involved the use of redundant acquisition technologies and often include real-time video with range-finding

capabilities. Insurgent forces have modified traditional tactics to evade U.S. counterfire capabilities. Specifically, they have used lightweight mortars in off-the-cuff or hip firing techniques that sacrifice accuracy for rapid displacement. Second, indirect fire has been applied in nonlethal variants such as illumination rounds to act as deterrents to insurgent activity. Although these appeared to have had some effect early in the Iraq theater, nonlethal application of indirect fires has significantly decreased due to its growing ineffectiveness and concerns with collateral damage.

Coinciding with the significant challenges posed to conventional forces that emerged from the insurgencies in Iraq and Afghanistan, those responsible for employing indirect fires have correspondingly shifted their principal focus away from massed effects to increased capability in coverage, responsiveness, and pinpoint accuracy. In the Cold War environment, indirect fire systems were primarily concerned with the employment of massed effects throughout the depth of the battlefield, from tactical close support through operational interdiction to strategic bombing. In the post-Cold War environment, specifically in the Iraq and Afghanistan theaters of operations, indirect fire systems are being employed almost exclusively in close support against very precisely located targets on call from friendly troops already in contact with the enemy. These indirect fires, as with direct fire, are subject to the rules of engagement for each theater and require the positive identification of targets and specification of their hostile actions or intent.

Indirect fire has been employed as a system from World War I to Global War on Terrorism operations. It has proven its effectiveness in conventional conflicts and is continuing to prove valuable in the counterinsurgency environment. The current path of indirect systems projects their use well into the foreseeable future.

INFANTRY

The infantry branch of the military consists of infantrymen, or foot soldiers, who carry one of two types of weapons—projectile or shock. The infantry constitutes the main land combat force of most armies. In that capacity, the infantry provides the core fighting strength of a country's army. Furthermore, the infantry plays a vital role in peacetime as well as during times of armed conflict. As might be expected, as the nature of warfare has changed in the late 20th and early 21st centuries, so has the role of the infantry, which faces new challenges in countries like Iraq and Afghanistan, where religious fundamentalism and modernity have clashed and where soldiers more often than not are tasked with implementing counterinsurgency operations against an elusive insurgent enemy. While soldiers find themselves confronting nonstate forces, they have new tools and technologies to use; whether they are engaged in conflict resolution or peacekeeping missions, infantry forces can rely on other military branches, such as the air force, to provide support, particularly when they are engaged in AirLand operations. Despite all the advances in technology and weapons systems in the 21st century, nations still need infantries to fight battles, conquer land, and win wars as well as the peace. This entry discusses the history and the role of the infantry in operations around the world.

History

The use of infantry units is a reflection of organized warfare, which has existed since the dawn of civilization, when men have worked together to achieve a common goal, which, in some cases, was acquiring land controlled by another group. Organized warfare has, however, evolved over time and has been influenced by the development of more sophisticated

operations, tactics, and weapons, all of which were affected by industrialization. Changes in weaponry facilitated the development of battlefield tactics at the very time when infantries became the largest and, some might argue, most important components of armies. During the First World War, for example, the British army at its peak numbered approximately 4,000,000 men. Infantries were more organized, trained, and cohesive. Prior to a battle, such as the Battle of the Somme (July–November 1916), 1 million or more artillery shells could be fired, and then thousands of infantry soldiers would emerge from the trenches and attack across “no-man’s-land.” Casualty figures frequently reached several hundred thousand. As infantry weapons became more lethal and the size of armies committed to battle increased, the impacts of conflicts grew. Casualty figures from the American Civil War would have been unimaginable just decades earlier, but they were nothing compared with those of the First World War.

During World War I, the war that marked the birth of modern war, machine guns, aircraft, and artillery caused a change in the way the infantry engaged in battle. As armies struggled to adapt to new weapons, trench warfare dominated the battlefield, and life for the infantrymen in the trenches brought mud, lice, rats, discomfort. The introduction of poison gas to the battlefield added a whole new level of horror for the foot soldiers. Fledgling aircraft roamed the skies as pilots gathered intelligence about the enemy and occasionally engaged in dogfights with enemy pilots. Because of improvements in artillery pieces and the introduction of smokeless powder, artillery could be situated behind the front lines. Artillery barrages followed by infantry charges into no-man’s-land resulted in massive casualties and the loss of a generation of men.

As a result of technological advances during the interwar period, infantrymen were more mobile during World War II. Because of increased mobility, small-unit tactics became increasingly significant, and armies successfully adopted and adapted them. In addition, improvements in tanks, aircraft, artillery, and weapons dictated the tactics employed by infantrymen in battle, whether they were struggling ashore, engaged in street fighting, or fighting in the jungles of the Pacific. Before the war ended, all of the major combatants had developed combined-arms tactics, which enabled their infantrymen to work in concert with tank forces and air forces to achieve

success on the battlefield. Despite increased mobility, however, infantrymen—truly foot soldiers—still walked great distances.

Because of technological innovations, like infantry fighting vehicles, the nature of warfare has continued to evolve since World War II, and the infantry has become increasingly wedded to combined-arms operations. Improved weapons and the introduction of other advanced technologies, such as the stealth bomber and the drone, have allowed the armies of major countries to reduce the number of infantrymen in uniform while at the same time requiring them to engage in new types of activities. The infantry is frequently called on to participate in peacekeeping operations, which is not the traditional role of foot soldiers. In addition, as armies combat non-traditional enemies, such as al Qaeda, the demand for the deployment of light infantry has grown. In the 21st century, new demands, which have required the development of new technologies and new tactics, have been placed on the infantry.

Post–Cold War Conflict

Several conflicts that occurred during the last decade of the Cold War set the tone for post–Cold War conflicts. In each, infantries played significant roles. In the first, which concerned the contested ownership of the Falkland Islands, the British defeat of a much larger Argentine force emphasized the concept of limited war and the efficiency of small, highly professional armies, all-arms coordination, and technological advantages. American forces challenged the legacy of Vietnam with Operation Urgent Fury, the rescue of American medical students on the island nation of Grenada. The success on Grenada combined with the end of the Cold War and the introduction of new technologies to redefine the American way of war, which would be demonstrated in Kuwait in 1990 (see below). During the last decade of the Cold War, Soviet troops faced challenges on the ground in Afghanistan, a limited conflict that persists, although with new participants. The Soviet–Afghan War, an asymmetrical conflict that fostered clashes between different ethnic and religious groups, however, set the tone for the more recent post–Cold War conflicts in the region. Not all of the post–Cold War clashes have been untraditional ones, although the tactics employed have been somewhat

revolutionary. Following the Iraqi invasion of Kuwait in August 1990, for example, U.S. and coalition forces were able to test a new tactic—AirLand Battle—for the first time. AirLand Battle proposed the integration of air, ground, sea, space, and cyberspace strikes on a battlefield that extended from the ground to the edge of the atmosphere. The air campaign commenced on January 17, 1991. The ground assault, which began on February 24, ended with a cease-fire 4 days later. The end of the Persian Gulf War, some speculated, signaled the end of infantry warfare; however, challenges to that speculation have come from several different arenas.

The post-Cold War era brought new challenges for infantry forces as they engaged in a new range of activities that included peacemaking, peacekeeping, and dealing with threats from terrorist organizations such as al Qaeda—in other words, from nontraditional enemies. Traditionally, UN forces have participated in peacekeeping operations since 1948, when the first troops were deployed to Palestine, although the number of missions was quite limited by the Cold War. The end of the Cold War brought a drastic increase in UN peacekeeping missions. In 1994 alone, the UN deployed 85,000 personnel from 70 different nations on 17 operations. Under Secretary General Boutros Boutros-Ghali, the UN peacekeeping mission expanded to include peacemaking, which involved intervention, when deemed necessary, in internal ethnic and civil wars to restore peace. The result was that infantry troops were called on to conduct operations the scope of which was beyond their training and expertise.

In September 1992, because famine combined with war had presented a humanitarian nightmare, the UN authorized action, and a small UN force arrived in Somalia. This UN operation provided a test for peacemaking advocates. The UN forces received a difficult task. They had to distribute food, while at the same time they had to engage in policing activities. By December, however, because the UN forces failed to secure delivery routes that would allow them to deliver food to the starving masses, the United Nations requested and received help from the United States. President George H. W. Bush deployed 25,000 combat troops to lead the security force in Somalia. The U.S. Army took part in Operation Restore Hope (December 1992 to May 1993). Although initially successful, concern that

anarchy would return once the peacekeeping mission ended resulted in a shift in focus to peacemaking, the disarmament of Somali militias, and an end to the war. The failure of Operation Restore Hope, which highlighted the difficulties in peacemaking, set the standard for future UN actions and illustrated the new, more difficult as well as dangerous role of infantrymen as humanitarian aid workers, not fighters.

The collapse of Yugoslavia and civil war in Bosnia also witnessed intervention by UN and North Atlantic Treaty Organization (NATO) forces. Unlike the situation in Somalia, however, UN forces strove to remain neutral. Ultimately, when a peace agreement, the Dayton Peace Accords, was reached, it became the responsibility of UN forces to monitor the agreement, which marked a return to traditional peacekeeping. Other successful UN peacekeeping missions began in Sierra Leone in 1999 and in Kosovo in 2000.

The al Qaeda attacks on September 11, 2001, thrust the Global War on Terrorism onto an international stage, brought the concept of suicide bombings to a new level, and led to the commencement of military operations by coalition forces first in Afghanistan (Operation Enduring Freedom, October 2001) and then in Iraq (Operation Iraqi Freedom, March 2003) and a shift from limited to integrated war. Success resulted from the integration of brute strength, technological superiority, and cooperation between disparate groups—special forces, army, navy, air force, and marines. The defeat of the Taliban and the fall of Saddam Hussein did not, however, return peace and stability to Afghanistan or Iraq, and the infantry's mission in those countries changed to peacekeeping, peacemaking, and countering insurgency.

In addition, because many of the operations conducted in Afghanistan and Iraq, particularly in the early stages of military engagement, involved coalition forces, the makeup of units engaged in a particular action generally consisted of varied combat groups from different armies. Their combined armed tactics reflected the makeup of the participating forces as well as the assigned mission. For example, NATO forces participated in Operation Snake Pit, or the Battle of Musa Qala, in Afghanistan in 2006–2007. The NATO Order of Battle for this operation included 1st Battalion, 508th Parachute Regiment (U.S. 82nd Airborne Division), UK 52nd

U.S. soldiers from 202nd Military Police Company, 504th Military Police Battalion, attached to 1st Brigade Combat Team, Task Force Raider, 4th Infantry Division, walk past a group of Afghan children while conducting a dismounted foot patrol in preparation for a ribbon-cutting ceremony in Kandahar province, Afghanistan, June 8, 2011. The ceremony signified the official opening of a new soccer field in Subdistrict 1 of Kandahar City. The new field was one of many projects headed by Task Force Raider and their Afghan National Security Forces partners in their joint-reconstruction efforts to improve quality of life, safety, and security for residents of Kandahar City.

Source: U.S. Army photo by Sergeant Breanne Pye (released).

Brigade, 40th Marine Commando, 2nd Brigade, 205th Corps (Afghan National Army), 1st, 2nd, and 3rd Infantry Kandak, and other groups. The Musa Qala district of Afghanistan is an opium-producing region and the birthplace of the Taliban. Elements of the NATO force, including the British 16th Air Assault Brigade, fought the Taliban for control of the area in the summer of 2006. By October, the Taliban had suffered defeat, and the British troops withdrew. Within 2 months, the local town council, or *shura*, that was responsible for security proved unequal to the task, and the Taliban infiltrated the region again. By February 2007, the Taliban openly assumed control of Musa Qala and summarily executed two

men accused of being NATO spies. Throughout the rest of the year, NATO ground and air forces waged combined operations against the Taliban in the area around Musa Qala. At times the fighting was heavy, and Afghan and NATO troops came under attack from Taliban fighters using machine guns and rocket-propelled grenades. It wasn't until mid-December 2007 that coalition forces regained complete control of Musa Qala. The postbattle assessment indicated several positives regarding the situation in Afghanistan. Although they relied on NATO advisors and NATO air support, the Afghan National Army inflicted heavy damage to the Taliban during the summer and fall of 2007.

In addition, they conducted a successful cordon-and-search operation.

Similar operations have occurred in Iraq beginning in the spring of 2003, when Combined Joint Special Operations Task Force–North (Task Force Viking) under the command of Colonel Charles Cleveland engaged in operations in northern Iraq. Over the course of 2 months, Task Force Viking initiated several engagements with the Iraqi army as it steadily approached through the area near Kirkuk. In late March, the Task Force launched an attack in the Sargat Valley and advanced from Gulp to Sargat and finally to Darmar. Initially, professional military forces engaged in action against each other, and Saddam Hussein's regime was ousted from power. Then in Iraq, as in Afghanistan, the nature of the situation changed as supporters of the old regime tried to regain control. In both countries, U.S. and other coalition forces are conducting peacekeeping and nation-building missions. Much of the work on the ground with the Iraqis and Afghanis is conducted by “boots on the ground”—the infantrymen. Infantry units have helped protect polling places during regional and national elections. They have provided security as both nations rebuild schools, hospitals, and other infrastructure. In addition to training Afghani and Iraqi military and police forces, the soldiers have tried to help stabilize the governments in the two countries, and they work toward controlling their own futures.

The introduction of nonstate actors has made the infantry's task much more difficult. The infantry's role, in many respects, has become much more complicated. Modern warfare has changed with time, but one thing remains constant. The soldiers on the ground—the infantry—are the ones who win or lose battles. Aircraft and tanks cannot take and hold land. That is a job for the infantry.

INTELLIGENCE, GEOSPATIAL

Geospatial intelligence (GEOINT) is a form of intelligence gathering that includes all aspects of imagery and the analysis of that imagery to inform policy and action. Sometimes called “the eyes of a nation,” its definition is codified in U.S. Code 10 § 467 as the “exploration and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the earth. Geospatial intelligence consists of imagery, imagery intelligence, and geospatial information.” GEOINT is grounded firmly in observation of the earth's features and analysis of human activity based on those geographic locations at specific times.

There are three components of GEOINT: (1) imagery (of either a natural or manmade feature), (2) imagery intelligence (the information obtained through analysis of the imagery), and (3) geospatial information (identifying information of a natural or man-made feature). More crudely put, GEOINT is exploiting and analyzing information provided by images and data that describe physical features and activities that can be geographically referenced.

GEOINT is best conceptualized as a complement to other intelligence-gathering disciplines, rather

than as a wholly separate system of collecting intelligence. In relation to the other “INTs,” GEOINT relies on geospatial information and the knowledge gleaned from a combination of sources, including imagery intelligence, signals intelligence, and human intelligence. This knowledge is required to understand not just the *what* of human or natural activities but also the *why*. These other intelligence disciplines provide the context for what is observed and together constitute GEOINT.

Military Applications of Geospatial Intelligence

GEOINT is utilized by militaries to map terrain, follow enemy troop formations, gather intelligence on military staging, and generally inform policymakers of the activities of both friends and foes that can influence the formation and execution of foreign policy.

Since 1989, GEOINT has been used to uncover evidence of ethnic cleansing in Kosovo in the late 1990s, to support the military and government response to Hurricane Katrina in 2005, in support of cities hosting the Olympics, and to support humanitarian efforts after the 2010 earthquake in Haiti and the 2011 earthquake off the coast of Japan. These events highlight the dual necessities of GEOINT: both temporal and physical location. The evidence of atrocities in Kosovo came from comparing the same geographic locations over time, which revealed the presence of new mass graves. Without the temporal component in the analysis, the geographic imagery would have revealed only that gravesites of great size existed in these locations but not that they were newly created. Geographic images of postearthquake cities reveal damage to manmade objects, but it is only when coupled with the temporal placement of these images that changes to the actual geography can be understood, as was seen in Japan when the physical location of the country was shifted.

In nonhumanitarian military deployments, GEOINT is crucial for understanding the topography and geography of an environment. When, in the aftermath of September 11, 2001, U.S. forces moved into Afghanistan in the search for Osama bin Laden, GEOINT was critical in locating Taliban and al Qaeda encampments and forces, as well as in understanding the complex cave systems that were suspected of sheltering him.

Geospatial Intelligence in the United States

In the United States, the National Geospatial-Intelligence Agency is the government agency primarily responsible for compiling and disseminating GEOINT to other intelligence agencies and to policymakers. However, GEOINT is also utilized and compiled by various military units that are specifically tasked with producing this intelligence, including the Advanced Geospatial Intelligence Node of the United States Army Space and Missile Defense Command and the Marine Corps Production and Analysis Companies placed within Intelligence Battalions and Topographic Platoons.

There is also significant overlap in GEOINT between the National Geospatial-Intelligence Agency and the other members of the Intelligence Community—in particular, the National Reconnaissance Office, which manages the U.S. fleet of spy satellites. Each discipline of intelligence gathering relates to the others, forming an interplay that is necessary for understanding the complete picture. For GEOINT, this is seen across the Intelligence Community in the Geographic Information System: All members of the Intelligence Community contribute to this by geo-tagging their content, adding geographic context to all gathered intelligence. The result is that intelligence gathered from a tapped phone line is tagged by the location of the conversation and the location of the targets mentioned in the conversation. GEOINT is adept at providing the where and sometimes the how of a situation: where a nuclear missile might be located, for example, and when it was put there. Analysts can discern intention, however, by combining GEOINT with other intelligence collected by an asset on the ground or read by an intercepted e-mail.

The Evolution of Geospatial Intelligence and the War on Terror

Advances in GEOINT are tied to advances in geospatial technology. From the origins of photography and maps, reliant on in-person observations, cartography, and scouting, GEOINT has evolved to a highly advanced system of satellites and surveillance. As technology continues to develop into more sophisticated systems, GEOINT will similarly evolve, providing a clearer and more accurate picture. These technologies include myriad forms of earth mapping, from aeronautical images and data

to radio detecting and ranging, Global Positioning System usage, advanced cartography, digital recreations of physical masses, and photogrammetry. Computer imagery in particular allows for the ability to see details missed by the naked eye or by a satellite in orbit.

These technological improvements remove GEOINT from its human producers and analysts; it is no longer an issue of a man on horseback scouting foreign troop formations but of recalibrating satellites and redirecting them for closer surveillance of a target that is thousands of miles away—but this surveillance may be more revealing than observation by a person on the ground. That is not to say, however, that improving technology renders human participation in GEOINT irrelevant; the best images of Soviet missiles in Cuba are meaningless without the analysis to understand and inform the meaning and the implications of such images.

GEOINT now comprises a field of technology that utilizes the Global Positioning System, cartography, surveying, the Geographic Information System, photogrammetry, radio frequency identification tags, cellular devices, personal digital assistants, and video surveillance. All of these devices and systems assist in defining the location or features of a particular target, natural or constructed, within a specific timeframe.

There are two particular issues involved in the use of GEOINT moving forward. The first is the continued suitability of the established definition of geospatial technology. The second is international and domestic resistance to the perceived violations of privacy.

The development of newer and better technology to create intelligence from geospatial information shows the limits of the definition listed in the U.S. Code. As state capabilities for producing GEOINT increase, there is a debate over how accurate the current definition continues to be. A new definition has been proposed that would reclassify GEOINT more broadly in an effort to better capture its many facets. This new definition would identify GEOINT as a field of knowledge and process based on information that is placed within a context of both space and time that provides descriptions, explanations, or predictions of human activities that influence policy action. The process of GEOINT would include the ways in which information is collected, manipulated, and understood on a geospatial basis and then shared with decision makers. The nature of GEOINT has changed so much that it has left its

legal definition far behind; the field of GEOINT has far surpassed that narrow definition.

However, with the development and improvement of the very technologies that make a new definition necessary come increasing concerns about privacy and government infringement on the liberties of its citizens and of foreign governments and their citizens. Geospatial information and intelligence have many benefits, including the decreased risks to military and civilian personnel that come with being able to observe from afar; similarly, the use of drones to target specific persons or facilities means that “boots on the ground” or manned planes in the air are not required to conduct dangerous missions. The controversy surrounding these methods and the implications for civil liberties and rules of engagement will continue to be present in the conversation about GEOINT.

GEOINT is one more tool in the intelligence world to assist in policy making. As with its fellows in the “INT” world, GEOINT couples observable fact with analysis to understand what is happening in the present moment, what has happened, and what may happen in the future, all to better inform decision makers. The world of GEOINT is ever expanding, and such expansion requires engagement with the moral and legal questions of its methods, particularly in the Global War on Terrorism.

Drone warfare and its expanded use in the War on Terrorism represent a perfect example of the necessity for greater clarity with regard to GEOINT purposes and processes. Unmanned aerial vehicles (UAVs) are capable of surveilling targets and locations without putting troops in harm’s way. These UAVs, however, are capable of more than simply taking photographs and mapping territory; they are now capable of relaying information immediately. More important, UAVs can now be used to fire on those targets. Instead of merely serving as a tool for intelligence gathering, UAVs and drones can be used to carry out policies without placing humans in the air.

These aircraft thus show the immediate application of GEOINT. A UAV flying over a hostile area may relay intelligence specifying that at that moment a specific target is in sight, thus placing it in spatial and temporal context. Rather than waiting for the UAV to return to its base and sending out a team to address the threat, the UAV can be directed to eliminate the target at once, because of the intelligence that was collected via this UAV.

The potential for technology such as this is endless but dangerous, making it easier both to carry out violent acts and to accurately and immediately collect, analyze, and disseminate valuable intelligence.

INTELLIGENCE, HUMAN

Human intelligence (HUMINT) represents the oldest and most elemental form of intelligence activity. Although technological advances in technical intelligence services such as signals and imagery have lowered the profile of HUMINT activities, in recent years the focus on terrorism and nonstate actors has again emphasized the importance of HUMINT. Specifically, military branches have made HUMINT a priority, as many criminal and/or terrorist groups have reduced their visibility and use of communications technologies open to signal intercepts.

Fundamentally, HUMINT consists of gathering information through infiltration,

interviews—collecting data from people and institutions—and extracting any information of tactical and/or strategic value. This entry discusses the types of HUMINT activities, the training and skills required for HUMINT operators, the steps in handling information, and recent operations.

Kinds of Activities

Commonly, HUMINT services are related to espionage, which consists of infiltrating operatives or making contact with individuals in foreign countries or within organizations with the intention of extracting information. HUMINT operations also encompass efforts of frontline troops to uncover the enemy’s activities—for instance, gun emplacements, troop movements, and the placement of roads and other infrastructure. Social and diplomatic activities are also fundamental aspects of HUMINT, as are prisoners’ interrogations and debriefings of friendly troops.

Human Intelligence: Historical Background

HUMINT activities stretch all the way back to the ancient world. The Chinese, Indians, Mediterranean societies, and Native Americans used basic human observation to forestall enemy actions and help friendly forces gain military, political, and economic advantage. Skills such as common sense, knowledge of languages, and psychological understanding of the enemy were vital to infiltration activities and successful covert operations. In the 20th century, the British, Germans, Soviets, and Americans extensively used HUMINT activities to obtain critical information during both World War II and the early years of the Cold War era. New technologies developed in the 1950s, however, reduced the influence of HUMINT inside intelligence services, as the ability to collect data through aerial and satellite reconnaissance led many to claim that HUMINT activities were obsolete. During the Vietnam War, HUMINT again gained ground in the intelligence services, with a particular focus on prisoner interrogation to determine enemy activities and data collection in front of and behind enemy lines. These activities were widely undertaken by long-range patrol scout teams made up of Special Forces or Green Beret units. However, in subsequent years, HUMINT was again superseded by technology-driven intelligence activities like electronic intelligence and signals intelligence.

From Collapse to Victory in the Use of HUMINT

U.S. intelligence services were broadly criticized for their poor performance with regard to the attacks of September 11, 2001. Many critics pointed out that U.S. intelligence services, including those of the military, focused too narrowly on indirect and technological intelligence-gathering services at the expense of human methods that had demonstrated their effectiveness in the past. Likewise, incomplete information about Iraq's possession of weapons of mass destruction and Saddam Hussein's ties with al Qaeda suggested American intelligence services' inadequate use of HUMINT. These mistakes generated the momentum to revive HUMINT activities, which have subsequently proven very useful in the Global War on Terrorism.

HUMINT Process

According to the U.S. Army Field Manual *Human Intelligence Collector Operations*, HUMINT operators should embrace a variety of intelligence-gathering methods. HUMINT agents and agencies must, however, act in accordance with applicable law and policy, including the Geneva Conventions and the U.S. Constitution. Additionally, the intelligence community generally embraces five common steps in the handling of information:

1. *Planning and preparation*: establishing the conditions to collect data, taking into account operational plans and issues relating to the type of source and location—for example, geographic conditions and cultural practices
2. *Approaching*: gaining cooperation and confidence from the source and taking care to maintain its safety and viability
3. *Questioning*: obtaining information by following a careful interrogation plan embracing only the most pertinent questions
4. *Termination*: ensuring that work with the sources will be finished without mistakes while preparing for other operations
5. *Reporting*: organizing and collating information for commanders and officials

Collector Skills

Due to its focus on interpersonal interaction, HUMINT is a human-centered activity in which

the individual represents the primary intelligence-gathering tool. Therefore, the HUMINT operator must possess intellectual and cultural knowledge that allows him or her to effectively operate on the ground and adapt to local conditions. Patience, tact, focus, discretion, and prudence are vital virtues for this job. The operator is the key member in the HUMINT process, and his or her preparation must represent an ongoing effort to refine his or her craft in wide-ranging disciplines like languages, acting classes, weapons, and radio systems, including those of the enemy, and emerging technology. Training for HUMINT operators includes 10 weeks of basic training, followed by 20 weeks of advanced training in information gathering, HUMINT analysis, interrogation techniques, and language skills, among others. Much of the training is done out of the classroom to put the collector in contact with the environment(s) he or she will encounter in a hostile or war zone.

Recent HUMINT Operations

Recently, HUMINT activities have proven central in the Global War on Terrorism, providing key information leading to the capture or killing of high-value target individuals in both Afghanistan and Iraq. Cooperation between civilian and military intelligence services led to the capture of Saddam Hussein in 2003 and the successful raid that killed Osama bin Laden in 2011. HUMINT has also been key in a number of other operations against al Qaeda and other terrorist organizations such as the Taliban in Afghanistan. American intelligence services continue to work to expand HUMINT operations and better integrate those efforts with other intelligence forms to improve the overall intelligence capabilities of the United States.

INTELLIGENCE CYCLE

After raw unrefined data or information is gathered, it must be converted into intelligence and made available in a form useful to end users such as political and military leaders and policymakers. This process consists of several steps: requirements, planning/direction, collection, processing, production/analysis, and dissemination. This procedure is called the *intelligence cycle*. This entry discusses the steps of the intelligence cycle, what happens when intelligence fails, and advanced intelligence analysis.

First, *requirements* are specified information needs that *must* be known to ensure national security. In the case of the Central Intelligence Agency, the director of national intelligence receives guidance from the president, the national security advisor, and the homeland security advisor. The attorney general and the director of the Federal Bureau of Investigation also have input regarding the intelligence requirements necessary to counter national security and major criminal threats. The determining of requirements is often done in concert with or as part of the planning and direction step of the process.

Next, the *planning and direction* step is led by the executive assistant director for the National Security Branch of the Federal Bureau of Investigation and by senior leaders of the Central Intelligence Agency, the National Security Council, and the director of homeland security. This step is really the beginning and end of the intelligence cycle as management of the entire effort as well as benchmarking of results (and the generation of new requirements) is vested in the direction and guidance of public officials and bodies such as the National Security Council. Specific collection requirements are elucidated, and action plans are prepared.

Collection is the gathering of raw data and information needed to fulfill requirements. Information

can be collected overtly (openly) or covertly (secretly). Open-source reporting (monitoring of television and radio broadcasts, newspapers, books, political meetings, speeches, and Internet sources) is critical. More covert sources, such as interviews, technical (electronic, camera, satellite, and computer) surveillance, physical surveillance (spying), human source operations (liaisons, defectors, and informants), and searches all contribute to the raw data collection. Electronic surveillance requires numerous specialists to implement the collection methods, operate the equipment, and interpret the results. As an example, satellite photographs may require specialized weapons experts to interpret them properly. Military intelligence is also segregated into human intelligence and signal intelligence, depending on the source.

Processing and exploitation is the fourth step. There exists a spectrum of processing and exploitation methods. The intelligence collector might have processing capacity, or processing can be “downstream,” after the information is passed along to other individuals or agencies. Usually there will be heavy computing requirements and consequent economies of scale in processing. Additionally, there are requirements for intimate technical knowledge, as noted above. Some methods used in converting the vast amount of raw information into a form usable by analysts are decryption, language translation, data reduction, and the entering of raw data into databases to apply algorithms. In the current military environment, the intelligence cycle is expressed through the acronym TPED, which stands for tasking, processing, exploitation, and dissemination. Not really a process or a system, TPED is a sort of supply chain management for the intelligence community, especially the electronic imagery aspects of intelligence gathering. But TPED does point the way to further incorporation of processing and exploitation into a single coincidental step.

The *analysis and production* step involves the conversion of information into intelligence. The raw material is evaluated and analyzed for reliability and relevance, and intelligence products—papers, presentations, studies, analyses—are prepared.

In the last step, *dissemination*, “intelligence products” are prepared and distributed to policymakers and stakeholders. Assessments, association charts, financial records, case analyses, statistics recommendations, and conclusions are a small part of the products prepared.

Intelligence failure can take numerous forms. *Overestimation* occurs when a perceived threat is magnified and disproportionate resources are committed to it. *Underestimation* occurs when a leader or an agency is in denial about the extent of a threat, possibly because the means to counter the threat are not available. These can both be examples of *subordination to policy*, in which intelligence is disregarded because it does not fit what the policymakers want to hear. *Lack of communication* between agencies can affect interpretation and response (often cited as a factor in the 9/11 terrorist attacks). *Excessive restrictions on classified material* may cause the necessary information to be unavailable. *Received opinion* or *conventional wisdom* may allow incorrect assumptions to be perpetuated. *Mirror imaging* or drawing analogies between a novel situation and previous known situations may lead to incorrect assumptions by analysts and policymakers. *Overconfidence* and *complacency* may lead to an insufficient threat assessment, and *failure to connect the dots* may lead to an inaccurate interpretation of intelligence.

Advanced intelligence analysis usually includes the following:

- Psychological profiling, first believed to have been used in 1986 to analyze foreign leaders but actually in use long before, such as the famous psychiatric profile of Adolf Hitler compiled during World War II
- Estimative intelligence, involving estimates of the strength, capabilities, and “mood” of an enemy nation—somewhat subjective, sometimes dangerously so
- Warning intelligence or threat assessment, utilizing history and hindsight to produce indicators and warnings as early signs of potential threats
- Fusion intelligence, especially in the wake of the 9/11 attacks, which focuses on real-time data sharing and analytic cooperation
- Economic intelligence
- Scientific and technological intelligence, which includes weapons potential (e.g., nuclear capability) and aerospace and cyber capabilities (IntelligenceSearch.com)

INTELLIGENCE ORGANIZATIONS, MILITARY

Collecting, analyzing, and disseminating military intelligence is a vital task shared by a variety of government agencies. In addition to the civilian Central Intelligence Agency (CIA) and Department of Homeland Security, a number of government civilian and military organizations engage the intelligence field. In the United States, military intelligence organizations comprise eight discrete agencies, offices, and units. They are the Air Force Intelligence, Surveillance, and Reconnaissance Agency (AFISRA), the Army Intelligence and Security Command, the Defense Intelligence Agency (DIA), the Marine Corps Intelligence Activity (MCIA), the National Geospatial-Intelligence Agency (NGA), the National Reconnaissance Office (NRO), the National Security Agency (NSA), and the Office of Naval Intelligence (ONI). All of these organizations are considered part of the U.S. Intelligence Community (IC), and as such, each reports to the director of national intelligence. However, because they are also military organizations, each agency (and its employees, both civilian and military) also answers to the secretary of defense.

The History of Military Intelligence

George Washington established the first American human intelligence (HUMINT) networks in Boston, New York, and Philadelphia to provide information about British troop movements. The Civil War continued this ad hoc intelligence tradition, with both Union and Confederate governments lacking a formalized intelligence-gathering system. Nonetheless, code breaking, covert surveillance, and other tools of spycraft were utilized; Abraham Lincoln also established a HUMINT network. The Civil War also saw the advent of aerial reconnaissance, as the Union pioneered the use of observational balloons. Following the war, however, any advances in U.S. intelligence were allowed to atrophy by a nation tired of war that believed intelligence gathering to be unnecessary in peacetime.

World War I saw major progress made in the field of military intelligence when the commander of the Allied Expeditionary Force in France established an intelligence center for the collection, analysis, and dissemination of information relevant to the European theater of war. The Great War, with its technological advancements across all avenues of war making, also saw new levels of sophistication in aerial reconnaissance, HUMINT collection, and signals intelligence (SIGINT), or intelligence gathering by the use of signals. SIGINT was bolstered by the Army Signal Corps, which manned radio-listening posts and provided interception and direction-finding equipment. Once again, however, in the interwar period, the United States failed to maintain its military intelligence capabilities.

The Japanese attack on Pearl Harbor in 1941 represented one of the greatest failures of military intelligence, but it served to crystallize the need for a substantive military intelligence system, even in times of relative peace. The attack spurred the army and navy to improve their capabilities to process and disseminate intelligence, as well as set up joint intelligence centers at both the national and the theater level to better coordinate efforts. Clandestine operations, aerial reconnaissance, SIGINT interception, and geospatial intelligence (GEOINT) were all hallmarks of World War II, though the war's most important and lasting intelligence legacy came in pushing Congress and the public to recognize the need for a permanent, established intelligence apparatus.

The tensions of the Cold War cemented this recognition as the United States frequently turned to military intelligence to protect or enhance its

strategic and tactical position, from U-2 surveillance flights over Cuba during the Cuban Missile Crisis to wiretapping undertaken by the NSA and the exploitation of GEOINT to determine the placement and development of nuclear weapons.

Since the end of the Cold War, military intelligence and its corresponding organizations have found themselves facing new challenges. Changes in international power dynamics, such as the fall of the Soviet Union, the breakup of Yugoslavia, and the Arab Spring in the Middle East, have eroded the stability of the bipolar world. Rather than facing clear military threats posed by well-defined enemies, the United States has been faced with guerrilla tactics on a global scale, counterinsurgencies, and rogue regimes. Military intelligence organizations now must compete with nonstate actors and subversive, hostile elements within states that are otherwise allies. Crumbling relations with Pakistan in the wake of the assassination of Osama bin Laden are a clear example of this. While Pakistan remains a U.S. ally, the Pakistani government has done little to curb the influence of al Qaeda, even within its sovereign borders, providing aid and comfort to enemies of the United States.

The Organizations and Their Purposes

Military intelligence organizations in the United States are delineated by either method or military branch. Of the eight organizations, half are dedicated to gathering intelligence for a specific branch of the armed forces—one for each major branch. Three are dedicated to exploiting a particular form of intelligence gathering, and the last, the DIA, serves as a general catch-all organization. AFISRA, the air force's intelligence component, provides policy, oversight, and guidance to all intelligence organizations within the air force. As such, AFISRA trains and equips personnel to conduct and collect intelligence, surveillance, and reconnaissance. The Army Intelligence and Security Command formulates policy, plans, programs, and budgets and manages and oversees all intelligence activities for the Department of the Army. It is particularly responsible for the coordination of imagery intelligence, SIGINT, HUMINT, measurement and signature intelligence, and counterintelligence. The DIA is a Department of Defense agency designed to support combat operations. One of the major producers of intelligence and a lynchpin of the IC, the DIA provides intelligence to those who fight the wars, those who make defense

policy, and those who plan wars. This agency supports military planning and operations, as well as weapons system acquisition; its director is the principal adviser to the secretary of defense and to the chairman of the joint chiefs for matters of military intelligence. MCIA's purpose is to provide tactical and operational intelligence for use on the battlefield. Its staff utilizes HUMINT, SIGINT, GEOINT, and counterintelligence and is responsible for ensuring a coherent and uniform strategy for developing Marine Corps intelligence. NGA provides GEOINT, which places information within a specific geographic location and temporal context. Geospatial intelligence uses imagery to glean intelligence. NRO is staffed by Department of Defense and CIA personnel and is responsible for designing, building, and operating the country's array of reconnaissance satellites. If NGA is the eyes, then NSA is the ears of the United States, using SIGINT to protect the country and its secrets while simultaneously working to learn foreign secrets that may pose a threat to domestic or international security. Of the military intelligence agencies, The NGA has the greatest role in assisting in humanitarian crises. The ONI's primary function is maritime intelligence, and it assists in providing intelligence to joint warfighting forces. This agency specializes in scientific, technical, geopolitical, and military intelligence information.

Military Intelligence at Work

These military intelligence organizations must exist within both the IC and the military framework. While the military chain of command dictates much of how these interactions take place, the combination of military and civilian employees within an agency complicates clarity of jurisdiction. This confusion is heightened by two additional designations used by the IC: (1) the National Intelligence Program (NIP) and (2) the Military Intelligence Program. Under the 1947 National Security Act, the NIP is responsible for all activities of the intelligence community but does not include activities of military departments to acquire intelligence meant solely for tactical missions undertaken by the military. Using just these parameters, it would appear that INSCOM, ONI, AFISRA, and MCIA should fall under the Military Intelligence Program, while the NRO, NGA, NSA, and DIA would be designated part of the NIP. In point of fact, the NRO is part of the National

Foreign Intelligence Program, which falls under the NIP. However, in terms of military intelligence, all eight organizations overlap, and assigning them to one or the other is an ad hoc decision.

Military intelligence comes in three base forms, strategic, operational, and tactical, and the form of the intelligence dictates its use by the military intelligence organizations. On the surface, each of these agencies functions as any other intelligence agency does. Using certain tools, they attempt to obtain, analyze, and disseminate intelligence. These tools traditionally comprise five main components: imagery intelligence, SIGINT, HUMINT, measurement and signature intelligence, and counterintelligence. The specific tools used depend on the agency (the NSA relying primarily on SIGINT, NGA on GEOINT, etc.) and the goals of that agency (the ONI focusing on maritime intelligence). Military intelligence, however, is geared predominantly toward military decisions, both in terms of policy and in terms of action. Military intelligence, across all agencies, is meant to provide the best possible information for warfighters and the decision makers who send the troops.

In recent years, however, the line between military and so-called civilian intelligence has been deteriorating rapidly in the United States. While the intelligence organizations belonging to each military branch are well delineated, with specific purposes and specific clients, the NSA, NRO, NGA, and DIA overlap in these arenas. For example, the NRO directs the satellites whose pictures the NGA analyzes; the information gleaned from these images might be most relevant to a DIA operation on the ground. Reforms to the IC mean that these four agencies should be more able and willing to share intelligence between them, but the legislation enacted following 9/11 has yet to fully bear its intended fruit. Furthermore, the primary threats to U.S. security are no longer easily classified within the traditional military framework. Nonstate actors such as al Qaeda and other militant groups are changing the nature of warfare, requiring military intelligence to adapt.

The increasing paramilitarization of the CIA also threatens the military intelligence apparatus. With the CIA developing its own capabilities for carrying out military action without coordination or cooperation from military intelligence organizations, the distinction between civilian and military must either be redefined or actions curtailed, lest the two meld into one. These issues will continue to dominate

the military intelligence field and suggest a complex future for all military intelligence organizations.

INTELLIGENCE OVERSIGHT, CONGRESSIONAL

Developed since the 1970s, congressional intelligence oversight has involved diverse efforts by Congress to ensure that the intelligence community operates effectively and in accordance with the Constitution, laws, and core values of the United States. It is a key challenge for a democracy to hold intelligence agencies accountable without compromising classified information. This entry examines its history, key objectives, general mechanism, and major problems.

Historical Background

In the mid-20th century, the need for robust regulation and oversight of the intelligence agencies became increasingly obvious. Already a significant part of the U.S. national security apparatus at the end of the Second World War, the intelligence community expanded rapidly in the 1950s and 1960s. At the same time, police states in the 1930s and 1940s (Nazi Germany in particular) and the U.S.

Army's domestic surveillance activities against civil rights campaigners and antiwar activists in the 1950s and 1960s, which were made public in 1966, underlined the potential tension between secret intelligence and civil liberty. Despite all this, Congress remained reluctant to investigate the activities of the intelligence community, leaving intelligence oversight largely in the hands of the executive branch.

This "era of trust" came to an end when a series of ill-advised operations by intelligence agencies was exposed first by the *New York Times* in 1974 and then through the congressional inquiries conducted by the Senate Select Committee to Study Governmental Operations With Respect to Intelligence Activities (chaired by Frank Church) and the House Select Committee on Intelligence (chaired by Otis Pike) alongside the President's Commission on CIA Activities Within the United States (led by Vice President Nelson Rockefeller). Those media reports and official investigations uncovered what many saw as improper covert actions in foreign countries (notably assassination plots and the overthrow of a democratically elected regime in Chile), illegal surveillance activities at home (including telegram interceptions, mail openings, and large-scale surveillance operations against groups and individuals who hardly posed any threat to national security), and other questionable projects (e.g., drug experiments and the illegal acquisition of chemical and biological materials). The initial *New York Times* revelations led to the Hughes-Ryan Amendment of late 1974, which required the president to sign a "finding" to authorize each covert action and to notify Congress of it. Following the Church and Pike committees' reports, Congress created the Senate Select Committees on Intelligence in 1976 and the House Permanent Select Committee on Intelligence in 1977.

With both sides recognizing the importance of congressional oversight, the newly formed committees and the intelligence community developed a close working relationship during the second half of the 1970s. The growing trust between the two parties allowed Congress not only to reduce the possibility of improper use of intelligence agencies but also to help the intelligence community improve its capabilities. The most important legacy of this era is four pieces of legislation passed between 1978 and 1980: the Foreign Intelligence Surveillance Act of 1978, designed to regulate surveillance

activities against U.S. citizens; the Intelligence and Intelligence-Related Activities Authorization Act for Fiscal Year 1979, which set forth the annual appropriation process for intelligence-related activities, so that Congress could use its control over the budget to perform its oversight duty; the Classified Information Procedures Act of 1980, which introduced a mechanism through which classified materials can be used in a criminal proceeding without compromising sensitive information; and the Intelligence Oversight Act of 1980, which requires, with some exceptions, the executive branch to keep Congress “fully and currently informed” about all major activities of the intelligence community. With enough flexibility and political realism, that legislation provided a foundation for intelligence oversight during the following decades.

While many aspects of the committees’ efforts in the 1980s appeared to remain relatively sound and effective, Congress also tried to regulate further details of intelligence operations, a move that the Reagan administration apparently saw as an excessive intrusion into the executive branch’s discretion to conduct intelligence operations. Particularly significant here was the first Boland Amendment, which was passed in 1982 to prevent covert assistance to the Nicaraguan anti-Marxist forces known as the Contras. In response, President Ronald Reagan created a secret organization (the Enterprise) to fund covert actions in Nicaragua outside the appropriation process of Congress, relying in part on secret weapons sales by the Central Intelligence Agency to Iran (the Iran-Contra affair). The revelation of this secret program in 1986 resulted in an investigation by a joint select committee, numerous reform proposals in 1987, and a general decline of trust between Congress and the intelligence community.

The following decade saw the rise of another problem in the congressional intelligence committees: a growing tendency for partisan advocacy, which became particularly prominent after the Republican takeover of the Senate and the House in 1995. Partly due to this adverse political environment—together with the lack of clear direction and priority in national security policy in general after the fall of the Soviet Union—the oversight efforts in the 1990s were marked by politically charged disputes over relatively minor issues in the annual intelligence authorization bill. This trend has been

seen by some of the former committee members as part of the reason why the committees were unable to initiate the strategic reforms that the intelligence community needed in the 1990s to meet the increasingly prominent security threats, such as nuclear proliferation and Islamic fundamentalism.

In the atmosphere of national emergency following the terrorist attacks on September 11, 2001, ambiguity and acquiescence characterized the congressional intelligence oversight in the 2000s. To various degrees, this general trend affected the four key developments during the decade. The first was the inquiries into two intelligence failures: one concerning the terrorist attacks in September 2001 and the other regarding the Iraqi weapons of mass destruction in 2002. The second issue was controversial intelligence activities conducted as part of the so-called Global War on Terrorism, which Congress was unable to regulate effectively. The most significant among those were the use of detention and torture to extract intelligence from terrorist suspects and the National Security Agency’s warrantless eavesdropping in the United States (for which the agency decided to notify only eight senior congressional members, or the so-called Gang of Eight, even though that option of limited notice applied only to covert actions abroad). The third was the failure during the second half of the 2000s to enact annual intelligence authorization bills, which Congress enacted from FY1979 to FY2005. The fourth issue, which largely stemmed from the first three, was the numerous proposals for intelligence reform, including some related to intelligence oversight. The 9/11 Commission’s final report in 2004 served as a basis for the Intelligence Reform and Terrorist Prevention Act of 2004 (which created the Director of National Intelligence) and less drastic administrative changes (e.g., the creation of congressional subcommittees on intelligence oversight). Many of the proposals made by the 9/11 Commission and other parts of the government, however, remained to be implemented.

Rationale and Objectives

The task of intelligence oversight does not fall exclusively in the hands of Congress. Directly responsible for intelligence policy, the executive branch has conducted its own inquiries and issued Executive Orders (including President Gerald Ford’s Executive

Order 11905 in 1976 prohibiting political assassination). In the judiciary, the high court judges intelligence-related cases, and the Foreign Intelligence Surveillance Court is to approve the government's surveillance operations within U.S. territories aimed at collecting foreign intelligence. The mass media has also play an important role in uncovering intelligence-related problems.

Nevertheless, in the realm of intelligence, where much of the information is not released to the public, congressional oversight—with its special procedure designed to protect sensitive information—remains the central part of checks and balances, which has the potential to reduce the risk of arrogance and narrow-mindedness on the part of the executive branch, to balance secrecy (which is seen as necessary for national security) and openness (a key aspect of a liberal democracy), to assure the public that the intelligence agencies are being used properly and effectively, and thereby to maintain public confidence and support for the intelligence community.

Practically, the congressional committees pursue two broad objectives: (1) to ensure that the intelligence community is operating in conformity with the Constitution, laws, and basic values of the United States (e.g., civil liberty and human rights) and (2) to help improve the efficiency of the intelligence agencies by making sure they have the necessary capabilities, resources, guidelines, and leadership.

Organizations and Mechanism

The most important players in congressional intelligence oversight are the Senate Select Committee on Intelligence and the House Permanent Select Committee on Intelligence, both of which are responsible for the oversight of the intelligence community as a whole. In addition, the issue of domestic surveillance falls into the jurisdiction of the Judiciary Committees and the Homeland Security Committees, whereas the Armed Services Committees are expected to play a significant role in the oversight of military intelligence. Some of the congressional support agencies (e.g., the Congressional Research Service, Government Accountability Office, and Congressional Budget Office) also help those committees to examine the activities and accounting of the intelligence agencies.

The key powers and means available to Congress vis-à-vis the intelligence community largely fall into four, overlapping categories. The first is the passage of legislation that regulates certain aspects of intelligence activities, including covert action, domestic surveillance, and the handling of information. The second is the appropriation of the intelligence budget—the use of the “power of the purse”—through the annual Intelligence Authorization Act, which approves funding for intelligence programs and thereby serves as a general guideline for intelligence operations. The third is the power of the Senate to approve or disapprove presidential nominees for some of the key posts in the intelligence community, such as the director of national intelligence. The fourth is various forms of inquiry, which include briefing sessions with intelligence officers, official hearings, field trips, independent investigations, and program evaluation.

The executive branch is to provide relevant information necessary for the committees to carry out their oversight duty. In particular, the executive branch is to inform the committees of any covert operation before its initiation. One exception to this principle of prior notice is that in a case of highly sensitive covert action abroad, the president can limit notice to the so-called Gang of Eight (the chairs and ranking minority members of the intelligence committees, the majority and minority leaders of the Senate, and the speaker and minority leader of the House of Representatives). Even in such cases, however, the president has to write a notice to the full members of the intelligence committees at the earliest possible occasion and explain the reason for the delay in reporting.

Problems and Challenges

The executive branch has failed to share information with lawmakers for various reasons, including simple technical errors, the need to protect sensitive information, the desire to conceal a controversial program, and the general disregard of congressional oversight based on the belief that the business of intelligence must be left in the hands of “professionals” in the executive branch.

In addition, the congressional committees themselves have had technical, administrative, and political problems—notably, limited time and resources

with which to investigate vast and complex intelligence activities, jurisdictional ambiguity and overlap among different congressional committees, partisan political pressure on committee members, and the relatively low electoral incentive of intelligence oversight, which operates largely behind closed doors and usually has little direct effect on the committee members' constituency.

The most basic problem, though, lies in the constitutional uncertainty regarding the checks and balances between the executive branch and Congress in the area of national security in general and intelligence in particular. There has been a long debate among legal professionals as to whether—as the executive branch has claimed—the U.S. Constitution (Article II) endows the president a constitutional privilege over national security and, if so, whether and when that privilege allows the president to circumvent the statutory requirement to keep Congress informed. Likewise, the congressional committees face the corresponding ambiguity over the extent to which the Constitution (Article I) allows Congress to shape or regulate intelligence-related policies. In the face of this constitutional uncertainty and the constantly changing context of national security, effective congressional intelligence oversight requires strong, bipartisan leadership in the congressional committees as well as proper dialogue between Congress and the executive branch.

INTERNATIONAL CRIMINAL COURT

The International Criminal Court (ICC) is the world's first permanent body exercising jurisdiction over grave offenses under international law. Established on July 17, 1998, by the Rome Statute, the ICC did not achieve meaningful existence until July 1, 2002, when it exceeded the critical mass of support needed from signatories to the statute. The court consists of two components: (1) a judiciary, comprising a president, judges, and administrative personnel, and (2) the Prosecutor's Office, embracing an independent prosecutor and investigators. The Assembly of States Parties, composed of representatives of states that have both signed and ratified the Rome Statute, supervises the work of the ICC and oversees its budget. The assembly may also increase the number of ICC's judges (currently 18) by a two-thirds vote. Its 18 judges are allocated among the ICC's various divisions (pretrial, trial, and appeals). This entry discusses the formation and jurisdiction of the ICC.

Background of the ICC and Its Formation

Like a river in full spate, the late 19th century was a channel bursting with international initiatives to mitigate the harshness of war. The idea of an international court to try war crimes emerged during this era, but it did not find firm purchase until the end of World War I, when the victorious authors of the Versailles Treaty provided in Article 227 for the prosecution of the Kaiser by an international court. Significantly, this proviso of the treaty was scuttled on the opposition of U.S. delegates to the peace conference and was not successfully revived until 1945. In the shadow of the Nazi atrocities, the moment seemed propitious for establishing a permanent international court. Instead, the prosecution of Axis criminality unfolded in ad hoc international tribunals (Nuremberg and Tokyo) and sundry national and military courts. Not until the late 1980s would a concerted effort to create a permanent international criminal court again arise.

The occasion was a proposal by Trinidad and Tobago in 1989 to establish an international

criminal court for combating the illicit drug trade and terrorism. A draft statute was forwarded to the UN's International Law Commission for its consideration. The International Law Commission then sent an assessment of the draft statute to the UN General Assembly. The report went far beyond the modest parameters of drug trafficking and terrorism, envisioning a court with robust jurisdiction over a wide range of crimes under international law. Over the next several years, the General Assembly, nongovernmental organizations, and other parties developed a blueprint that eventuated in the Rome Statute in 1998. After a successful vote by the delegations to the Diplomatic Conference (120 in favor, 7 opposed, and 21 abstaining), the statute creating the world's first permanent international criminal court was opened for signature.

Jurisdiction of the ICC

The Preamble to the Rome Statute describes the ICC as a body authorized to punish "shocking" crimes that threaten global peace. According to Article 13(b), the court may begin an investigation when the UN Security Council refers an alleged violation to the ICC prosecutor. (Chapter VII of the UN Charter supplies the ostensible basis for this referral.) The substantive offenses over which the court has jurisdiction are set forth in Articles 6 to 8.

Article 6 confers jurisdiction on the court over cases of genocide. The text of Article 6 reprises the elements of the offense in the UN Genocide Convention of 1948, that is, acts committed with the "intent to destroy in whole or part a national, ethnical, racial, or religious group as such." Such actions include homicide, inflicting serious physical or mental harm, willfully imposing conditions of life designed to destroy the group, maiming, preventing births within the group, and "forcibly transferring children of the group to another group." Like the 1948 Convention, Article 6 excludes social or political units from its definition of "group."

In both form and substance, Articles 7 and 8 closely follow the charges against Nazi war criminals listed in the Charter to the International Military Tribunal at Nuremberg. Article 7 invests the court with jurisdiction over crimes against humanity, including murder, torture, rape and other kinds of sexual violence, forced sterilization, enslavement, deportation, and similar acts causing severe and gratuitous suffering. To be justiciable, however, the

prosecutor must show that such acts were both deliberate and "part of a widespread or systematic attack directed against any civilian population, with knowledge of the attack." Article 8 furnishes the ICC with jurisdiction over four categories of war crimes: (1) "grave breaches of the Geneva Conventions," (2) "serious violations of the laws and customs applicable in international armed conflict," (3) grave offenses prohibited under Article 3 common to the four Geneva Conventions (a category of offense restricted to "armed conflict not of an international character"), and (4) "other serious violations of the laws and customs" of war.

In addition to the three substantive crimes outlined above, Article 5(1)(d) of the statute asserts the court's jurisdiction over the "crime of aggression." Article 5, paragraph 2, however, recognizes that the court will not exercise jurisdiction over this offense until its elements are subsequently defined. At the Review Conference of the Rome Statute convened in Kampala, Uganda (June and May 2010), the Assembly of States Parties deferred final determination of the issue until after January 1, 2017, when the support of two thirds of the States Parties and ratification by at least 30 of them will confer jurisdiction on the ICC to try crimes of aggression.

Conclusion

While the ICC's creation is an immensely important event in the history of human rights enforcement, the court remains hamstrung by superpower politics. From the beginning, the United States has opposed robust operation of the ICC, rejecting the model of universal jurisdiction in favor of one based on a state's voluntary acceptance. The United States also extracted a concession (found in Article 17) that made the ICC "complementary" to domestic courts—meaning it would intervene only when the courts of the offender's host country refused to prosecute. Moreover, under Article 16, members of the Security Council can stymie the ICC by requesting a moratorium on investigations or prosecutions for 1 year (and renewable thereafter). These limitations notwithstanding, other features of the ICC, particularly its permanence and its rejection of immunity for heads of state (Article 27) and the defense of superior orders (Article 28), are cogent evidence for the historic character of this institution.

INTERNET

The Internet is a series of interconnected networks operating on a common set of protocols. These protocols provide the foundation to support the applications most often associated with the Internet. These applications include the World Wide Web (www), instant messaging (IM), voice over Internet protocol (VoIP), file transfer protocol (ftp), and e-mail. The Internet is accessed from a wide variety of communication platforms, including telephone lines, cable, fiber optics, satellites, and cellular networks. Users connect to the Internet with a variety of devices including personal computers, cell phones, appliances, and gaming consoles. In short, the Internet is a network of networks that facilitates the interactions between computers, devices, and users. While not developed directly for a military application, its creation was largely influenced and funded by the military. This entry traces the history of the Internet and discusses its military uses.

History

Two researchers, Paul Baran and Donald Davies, from separate institutions, are credited with inventing the basic foundation of the Internet. Baran, a researcher at the RAND Corporation in the early 1960s, sought to create a communications network capable of surviving a nuclear attack. His premise was to build a decentralized command-and-control communications system whereby military communications could take any number of routes to their destinations. In the event that any component of the network was destroyed, the message would

still arrive through the remaining parts. In 1966, Davies, a physicist at England's National Physics Laboratory, was working on an improvement to telephone circuit switching. Both Baran and Davies independently came up with packet switching as the solution to their respective problems. Davies coined the actual term *packet switching*, which stuck.

Packet switching is accomplished by cutting full messages into smaller data packets. These small data packets are then sent to a series of interconnected routing stations. The routing stations accept and forward data through the most efficient route available until the data packets arrive at their final destination. If any of the routing stations go offline, as in the case of a nuclear attack, a new path is automatically chosen. Once all the data packets arrive at the final destination, the entire message is reassembled. The routing systems are asynchronous, so the individual routing stations decide the most efficient path, not the message sender. For example, depending on network conditions, the fastest way to route data packets from California to New York is through Asia to Europe and across the Atlantic. Packet switching was the framework on which the Internet was built.

Advanced Research Projects Agency (ARPA), DARPA, and ARPANET

In 1957, after the launch of the satellite *Sputnik*, President Dwight D. Eisenhower sponsored the creation of the Advanced Research Projects Agency (ARPA). ARPA was initially tasked with the responsibility of designing antimissile weapons and satellites, but shortly thereafter, the mission changed focus to the research and development of forward-thinking military applications. These uses ranged from ballistic missile defense to nuclear test detection. One division within ARPA was the Information Processing Techniques Office. It was within the Information Processing Techniques Office that the original Internet was incubated.

In 1967, ARPA awarded Stanford Research Institute a contract to design the first Interface Message Processor network, based on the original packet-switching technology. Using Honeywell's DDP-516 computer hardware, the first node of the network was installed at the University of California, Los Angeles, in the spring of 1969. In the fall, the second node came online at Stanford Research Institute. The initial network was rounded

out in December, with nodes being installed at the University of California, Santa Barbara, and the University of Utah. This network became known as ARPANET. The network grew as other research institutions joined.

Uses of ARPANET varied greatly. Scientific researchers were early adopters of the system, using it to access more powerful computing resources and to share information. For example, ARPA climate researchers, in support of military-related weather planning, used ARPANET to connect to supercomputing resources. Researchers sent weather simulation data to and from the participating computing resources at the various universities. The military used ARPANET for signals processing and seismic nuclear test monitoring in support of nuclear test ban treaties. Seismic monitoring signals were transferred directly to the processing stations within hours. This was a dramatic improvement over storing the signals on tape and mailing them for processing, an operation that took several days. The military also used the network to collaborate on the development of new weapons programs. Productivity and usage of ARPANET increased dramatically in 1971, when the computer programmer Ray Tomlinson developed a program that sent electronic messages between the networked machines. This program eventually developed into e-mail. E-mail became the most popular and widely used application because it allowed users to quickly communicate and collaborate with one another.

In a series of activities that aligned the ARPA closer to its military roots, it was renamed DARPA in 1972 (the *D* representing Defense). In 1975, due to the fact that ARPANET was no longer a “research” entity and needed to be managed with more oversight, the military’s Defense Communications Agency was tasked with running ARPANET. This brought the underlying tension between the scientific community and the military to the forefront. Once the Defense Communications Agency started operating ARPANET, exposure to and use of the system within the military grew. As a result, greater security and oversight were required, which exacerbated tensions with the scientific community, which preferred a more open and sharing environment.

In addition to ARPANET, ARPA brought two other networks online. The first was PRNET, a computer network that transferred information between computers through radio waves. This was a natural for applicability to military uses as radio was the

standard for battlefield communication. However, while well conceived, it was never fully developed. The other network that ARPA brought online was SATNET, a satellite-based packet-switching system. SATNET had a series of ground stations that communicated with the satellite. By connecting these three different networks together, the researchers at ARPA had built the foundations of a system network that could bridge different types of networks in a decentralized format. This fit the U.S. military’s need for connecting disparate networks, operating independently, and communicating in tandem with air-, land-, and sea-based systems.

The Next Internet

The next major advancement occurred in 1973, when the ARPA researchers Vinton Cerf and Robert Kahn developed the network protocol Transmission Control Protocol (TCP)/Internet Protocol (IP). This new network protocol improved the packet-switching concept. The main improvement came by creating a two-part protocol. Part 1, TCP, focused on communication between hosts. Part 2 was IP, which focused on communication between machines. By splitting the functions, the packet switching became more efficient. TCP/IP has been so successful that it remains the foundational protocol for the modern Internet.

ARPANET was converted over to TCP/IP in 1983. However, to ameliorate the tension between the military and scientific communities, ARPANET was split, and a military-only network called MILNET was created solely for the military. MILNET made use of stricter access controls as well as encryption to protect sensitive data. This split was logical and inevitable given the sensitivity of military data and the fact that academic institutions could not enforce the rigorous security standards necessary to support the military. Philosophically, the two were increasingly at odds. The researchers wanted a more open and inclusive sharing of information and resources, whereas the military wanted a more closed and controlled environment. At the same time, the TCP/IP technology was made available for commercial purposes. This allowed for greater development and innovation of the technology by the business world. This came about at the same time the personal computer market was establishing itself.

In parallel with ARPANET, the National Science Foundation (NSF) launched Computer Science

Network (CSNET), a high-speed network based on the TCP/IP protocol. CSNET charged money to any research institution that wanted to participate. A condition for participation was that the network was not to be used for commercial purposes. However, by 1990, with the redundancy that had emerged between ARPANET, CSNET, and other networks, CSNET and ARPANET were shut down and replaced by the National Science Foundation Network (NSFNET). NSFNET served as the new research-based network. In 1991, the NSF decided to turn ownership of the network to the private sector. In 1995, the modern, commercial Internet, as it is known today, replaced NSFNET.

No sooner had the commercial Internet taken hold than research and education institutions once again sought a separate network to support large-scale connections to supercomputers. Led by the NSF, the “next generation” Internet, named Internet 2, was built in 1995. Its design for high-speed data transport connects institutions involved in complex scientific applications supporting data-intensive applications.

The World Wide Web

The biggest problem with the NSFNET (and its predecessors) was that all the programs and interactions were text based. This made it difficult for nontechnical users to make use of the technology. Commercial Internet access providers, such as CompuServe and America Online, attempted to bridge this gap by creating private, graphics-based online communities that allowed users to e-mail, chat, shop, research, and perform other virtual activities. Then in 1990, Tim Berners-Lee, an employee at the European Organization for Nuclear Research, created a technological breakthrough that dramatically changed the way the Internet was used. Berners-Lee created the basic structure of what became the web. The web consists of four parts: (1) a transmission protocol, (2) an addressing scheme, (3) a programming language, and (4) an application to tie them all together. The hypertext transmission protocol (http) is the way in which information is exchanged between websites. The uniform resource locator (url) is the addressing scheme that allows users to type in a web address (e.g., www.internet.com) and be taken to the website in question. The hypertext markup language (html) is a programming language that codes information so it can be displayed. The

web browser is the program that communicates with websites with the help of urls over http and displays the html webpages. The html allowed for the easy display of text and images and subsequently audio and video. The development of the web made the Internet visual and accessible for nontechnical users. The rapid adoption of the www is arguably why most users equate the www with the Internet.

The Dot-Com Era

As the web became better known, communities sprouted up to support the different aspects of the web. The most dramatic development occurred in 1993 when Marc Andreessen led a group of programmers at the National Center for Supercomputing Applications at the University of Illinois to develop a new web browser called Mosaic. Mosaic was a graphics-based browser that made it easy for users to point and click on the information they desired. This browser was exceedingly popular and spurred the dramatic growth and popularity of the www. Andreessen and his staff left the National Center for Supercomputing Applications, moved to Silicon Valley, and started a company called Netscape. This spurred the creation of websites, search engines, and eventually e-commerce sites like Amazon.com. This was the dawn of the Internet-driven dot-com boom.

Before the www was introduced, finding information on the Internet was a challenging task. With the www, and the explosion of data that followed, finding content became exponentially more difficult. David Filo and Jerry Yang, graduate students at Stanford, created a solution to this problem by writing a computer program to index the web. They started doing this by hand and then eventually employed automated web crawlers to collect the information and organize it. They took their search engine and formed the company Yahoo!. Other search engines (Lycos, Infoseek, Magellan, Excite, etc.) joined Yahoo! as portals for finding information on the web.

Shawn Fanning, a student at Northeastern University, made extremely effective use of Internet technology by developing a small Internet application in June 1999 that forever changed the music industry. The application, known as Napster, was a simple utility to allow users to freely share digitized music files, known as MP3s, with anyone in the world using the service. Millions of users exchanged

hundreds of millions of songs without paying a single penny to the music industry. This had a dramatically negative impact on record companies, which in turn successfully sued to have Napster shut down. Yet the success of Napster demonstrated the power of the Internet as a media distribution channel. It sent a clear message to media companies that their future was inextricably linked with the Internet.

The Bubble Bursts

These technological breakthroughs created the excitement that led to significant investment in Internet-related companies. As the investment increased, these companies went public. The stocks of these companies shot through the roof. The dot-com bubble, which spanned approximately 1996 through April 2000, was defined by greed, excess, and the drive to get rich quick. A litany of tech start-up companies went public during the dot-com boom. Most of these companies had limited or poorly thought-out business plans. For example, pets.com, an online pet store, offered discounted prices and free shipping. However, free shipping for 40-pound bags of dog food proved to be financially unsustainable as the company burned through cash with minimal revenue growth. Despite these results, within weeks (and sometimes days) of going public, stock prices for many companies increased anywhere from 200% to 400%. Companies acquired other companies based on these inflated stock values. As an example, Yahoo! bought Broadcast.com, an online content delivery site, for \$6 billion in stock. Broadcast.com did not own its content, and its delivery system was rudimentary at best, but the perceived value was in providing content over the Internet; this was a prescient prediction, just not one worth \$6 billion. Other telecommunications companies poured significant money into infrastructure investments, running fiber optics and cables all around the world, betting that as the Internet grew bigger, data pipes were going to be needed. Perhaps the most visible sign of the dot-com excess was the purchase of Super Bowl ads by various dot-com companies. These companies spent tremendous amounts of money, driving the cost of 30 seconds of airtime to more than 1 million dollars. Unfortunately, the dot-com bubble burst during the first two months of 2000. The boom was over, and the future of the Internet was in question.

Web 2.0 and Beyond

In the aftermath of the colossal failure resulting from the dot-com bubble burst, a new web and Internet developed. Many of the technological innovations of the dot-com boom, while lacking good business plans, were significant. More important, the investments made in infrastructure provided a platform for a more productive Internet. Anchored by the emergence of a new and simple search engine called Google, developed by the Stanford students Larry Page and Sergey Brin, a new Internet emerged. This new Internet is commonly referred to as Web 2.0. Web 2.0 is built around simplicity and utility, eschewing the excesses of the dot-com bubble. It is marked by bidirectional interactions. Whereas the original www, now referred to as Web 1.0, was about one-directional information, where information was posted on websites for consumption, Web 2.0 engages users in creating, consuming, and interacting with the content. The two most notable examples of Web 2.0 are YouTube and Wikipedia. YouTube, created in 2005 by Steven Chen, Chad Hurley, and Jawed Karim, is a platform where anyone can upload a video to share. Not only can users share content, but other users can interact with the content by commenting, rating, or sharing the content with their friends. Wikipedia is an online encyclopedia developed by Jimmy Wales and Larry Sanger. What is the most unique, and most often criticized, feature of Wikipedia is that anybody can add/edit/delete any entry. A community of volunteers maintains the integrity and accuracy of the encyclopedia entries. The technology of Web 2.0 and increased user interaction have also led to the success of social networking. Services like Facebook, Myspace, and Twitter allow users to share all aspects of their lives with their friends and the broader digital world. What makes social networking so powerful is that users can connect with websites from a variety of different computer platforms, including cell phones. With the explosion of cell phone availability and the emergence of smart phones, users can share pictures, videos, and their thoughts easily through the various social networking sites. The ability to connect the various cellular networks to social networking websites is the result of a common and flexible Internet infrastructure. Furthermore, the improved technology of Web 2.0 has blurred the line between the underlying Internet and the web.

The Internet and the Future of Warfare

Many security analysts and pundits are predicting that the Internet will be the battleground of the future. As more and more nonmilitary systems—banks, stock markets, private industry, and core infrastructure—become connected (directly or indirectly) to the Internet, they become susceptible to attack from foreign enemies. There have been a number of highly publicized cyber incursions by Chinese hackers into U.S. business and energy systems to steal proprietary secrets. Many of these hackers have been traced back to the Chinese army. The Chinese are not alone in this endeavor, however; many other countries, including Russia, actively engage in hacking as a method of indirect warfare. The United States has developed an extensive arsenal of methods and tools for conducting web-based operations against enemies. While many of these capabilities and operations remain classified, the recently publicized Stuxnet Attack brought to light some of America's cyber capability. According to numerous sources, the United States developed Stuxnet, a computer worm designed to override software controls in industrial software, and allegedly deployed it in Iran's nuclear enrichment facilities. Rumors suggest—but neither country will confirm them—that the worm caused damage to as many as 1,000 of Iran's centrifuges, setting back their nuclear program.

The foreign cyber threat has forced the military to develop both offensive and defensive strategies for protecting the United States from cyber attack. The U.S. Air Force, the branch most associated with high technology, has been tasked with developing and implementing cyber capabilities. Initially, the air force created a dedicated Cyber Command, but in 2009, it transitioned it to the 24th Air Force and integrated it into the Air Force Space Command. To keep up with the rapid pace of technological change, the air force spends hundreds of millions of dollars with private contractors in support of its cyber duties. Also, though not publicized at this point, one has to assume that the cyber protection of the United States requires the intra-agency collaboration and resources of the National Security Agency, the Federal Bureau of Investigation, the Central Intelligence Agency, the Department of Homeland Security, and all branches of the military.

Conclusion

Where the Internet ranks in terms of the greatest inventions of all time remains to be seen. As of 2012, the Internet was largely responsible for the near collapse of the newspaper industry, and the broadcast media industry is increasingly shifting to distribution over the Internet. The cultural and social impacts of the Internet are nearly incalculable. An entire generation, commonly referred to as the millennial generation, has grown up immersed in Internet-based technology. Through use of the Internet, they have had the answer to any question at any time a mere mouse click away. It has reshaped the global economy; as the author Thomas L. Friedman argues, the world is now flat, and physical location is increasingly irrelevant as a result of the Internet. Others regard the Internet as the next big utility. If so, how will the utility be fairly distributed? How much government regulation does there need to be? Will the Internet be taxed? The Internet is not without its dark side. Internet addiction is a recognized ailment. Criminals and terrorist organizations have made extensive use of the Internet as a tool. Some countries even censor portions of the Internet. Yet the Internet's greatest impact may be its use as a battleground for future wars. The Cold War is long over, but its influence lives on in ways previously unimagined. A network conceived to survive a military attack, built with decentralization and open standards, has turned out to be the perfect platform for innovation, commerce, and, ironically, warfare.

INTERPRETERS AND TRANSLATORS

Interpreters and translators have always played a critical role in history. Kings in ancient Greece had interpreters alongside them. Missionaries served as interpreters between native peoples and others. Interpreters and translators have also played a critical role in the military. From the beginnings of our country, interpreters have served as guides and negotiators with the native peoples of America, as diplomats to foreign countries, and, in the case of the Navajo code talkers during World War II, even as speakers of linguistic code. This entry discusses the duties and types of interpreters and translators in the U.S. military.

Definitions

Because translators and interpreters both work to convert words from one language (called the source language) to another (called the target language), the terms are often used interchangeably. However, there is a distinction between a translator and an interpreter.

Translators are responsible for converting the written word from one language to another, while *interpreters* are responsible for translating speech from one language to another. In the military, specialists are called on to both interpret speech and translate documents as needed. For this reason, the position in Military Occupational Specialties is listed as interpreter/translator (09L for army/2799 for Marine Corps). Regardless of whether an individual is working as a translator or an interpreter there are certain skills required.

Interpreters and translators must be fluent in two languages: the source language and the target language. Both should have familiarity with the subject

area being discussed to use and translate specialized terms correctly. Both must also have an awareness of the cultures that the languages spring from. This knowledge helps them to accurately convey the meaning of the expressions, not just the literal translation. In addition to these proficiencies, because translators work with written language, they must also possess good writing and editing skills.

Types of Interpreters

There are basically two types of interpreters: simultaneous and consecutive.

Simultaneous interpreters provide interpretation as soon as the speaker begins to talk. This requires the interpreter to listen and translate the words at the same time. In other words, the interpreter translates and keeps pace with the speaker. This requires a great deal of concentration and skill and an excellent knowledge of both languages and the subject matter. Originally, simultaneous interpretation amounted to an interpreter sitting next to his or her client and whispering in the target language. However, this was incredibly inefficient and distracting to all parties involved. This changed with the invention of the electronic simultaneous interpretation equipment.

While there is some debate as to exactly when the system for simultaneous translation was invented, its use has been documented since the 1940s. The system is designed so that interpreters are in sound-proof booths. Listeners are set up with earphones and can turn the dial to the language they wish to hear. This allows for many simultaneous interpreters to be working at the same time and many languages to be available. A good example of this type of interpretation is the system that is used in the United Nations.

In the case of *consecutive interpreters*, the interpreter does not begin talking until after the speaker has stopped speaking. This may be a pause between thoughts or longer pieces of speech and may require the interpreter to take notes. Typically, this type of interpreter will translate sentences or passages. For example, this type of interpreter may be used in situations such as speeches or lectures. However, the military also uses consecutive interpreters to conduct interviews with friendly civilians in areas of military operation.

In addition, interpreters may be specialists in certain types of interpreting. For example, they

may serve as liaison interpreters, guides, medical interpreters, or conference interpreters. Interpreters and translators are also used by the military in legal proceedings such as investigations and war crimes trials. During the Nuremberg trials, for example, testimony was provided in four languages: French, Russian, German, and English.

Interpreter Duties in the Military

Anyone who wishes to become an interpreter or translator in the military must pass a language test. The type of test given will depend on whether or not the person already speaks a foreign language. The Department of Defense has two different types of tests: (1) the Defense Language Proficiency Test, a language proficiency test given to people who already speak another language to assess their current level of proficiency in the foreign language, and (2) the Defense Language Aptitude Battery, a language aptitude test to determine an individual's ability to learn a language. Because the need for interpreters in specific languages changes with time, the Defense Language Aptitude Battery is probably given more often as the number of interpreters in any given language changes over time and interpreters are always needed to meet new language demands.

Once individuals have completed coursework at the Defense Language Institute and passed the tests, they could be assigned to different positions depending on the specific language spoken and the branch of the military.

The U.S. Army has a unique brigade, the 300th Military Intelligence Brigade, which is composed of six battalions and has interpreters and translators fluent in 19 different languages. Members of the 300th Brigade work all over the world in positions as translators, interpreters in the field, and interrogators, and in counterintelligence.

In the U.S. Navy, linguists work from submarines, ships, or bases and may serve as interpreters for navy officials or dignitaries. However, the majority of naval linguists are focused on intelligence. Naval linguists focus on translation and interpretation of communications, classified documents, and cryptography.

Working With Civilian Interpreters

While it is preferable to hire highly trained interpreters who are under contract with the military as either

soldiers or contracted civilians, this is not always possible. The military often has to rely on local civilians who serve as interpreters. This can be problematic for a number of reasons. Foremost, locals who are skilled in English may not be willing to work for the military. Reasons for this reluctance vary with the situation. For example, in World War II France, the army's rate of pay was so low that highly skilled interpreters were not interested in taking the job. In Iraq during the 2003–2011 Iraq War, working as an interpreter for the coalition forces could increase the risk of harm to the interpreter or his or her family.

In addition, local civilians may not have enough knowledge of English to communicate effectively. This can affect the quality of interpretations and the outcome of investigations. Finally, security can be a problem when working with local interpreters. Interpreters may accidentally mention things that they heard or saw while working to their friends and family. For this reason, caution should be exercised in determining the types of jobs open to the interpreter and the access the interpreter has to military posts. Access should be limited and away from areas where classified information could be accessed.

On the other hand, locals can be very useful because of their knowledge of the local people, environment, and customs. This can provide added insight into cultural components that can affect the success of the discussions. For example, in some cultures it is necessary to follow certain rituals before a discussion can begin; in others, specific topics may be taboo or only approached in specific ways. A local interpreter can help you follow the appropriate protocols.

However, choosing a local interpreter must be done with great care. Consideration must be given to characteristics like age, gender, and ethnicity as those features can influence the outcome of a conversation. For example, in many cultures elders must be respected. This could lead to a less assertive questioning of important sources. In other cultures, women cannot speak to men, or certain ethnic groups will not speak to other ethnic groups—making successful communication nearly impossible. All of these factors can influence the amount of respect, information, and truthfulness the interpreter receives. For this reason, it is critical to be well versed in the community in which the interpreter will be working.

INTERROGATION

The exploitation of human intelligence (HUMINT) is essential to winning on the conventional and unconventional battlefield. By questioning prisoners of war and other detainees, interrogation supports this effort through the careful collection of valuable intelligence information. The purpose

of any battlefield interrogation is to elicit the maximum amount of reliable information in the least possible amount of time. Because this process involves establishing a dynamic relationship between two (often) adversarial individuals, and because today's battlefield is increasingly fluid, interrogation or "HUMINT collection" remains both a science and an art. It requires a cadre of professional practitioners who have the necessary experience, ingenuity, and tenacity to successfully—and lawfully—interrogate subjects of intelligence interest. This entry describes the basic procedures and techniques of military interrogations through the lens of the U.S. Army, the largest and most experienced HUMINT force in the U.S. military. Particular emphasis is placed on recent wartime operations in Afghanistan and Iraq and the controversy surrounding so-called enhanced interrogation techniques.

Interrogation History, Assets, and Doctrine

The U.S. military acquired significant experience in HUMINT collection during World War II when it conducted prisoner-of-war interrogations on a mass scale. Employing linguistically and culturally competent interrogators, the U.S. Army effectively questioned German and Japanese prisoners without the use of coercion. The Joint Interrogation Center at Fort Hunt, Virginia, secretly debriefed thousands of German government officials, military officers, and scientists, pioneering many innovative interrogation and eavesdropping techniques along the way. Likewise, the experiences of the Luftwaffe interrogator Hanns-Joachim Scharff (who amicably questioned captured Allied pilots) exerted considerable influence on U.S. military practices after World War II. Many of Scharff's noncoercive, rapport-based interrogation techniques form the foundation of today's HUMINT methodology. These practices were continued in Vietnam, Grenada, Panama, and the Persian Gulf.

Although every service branch of the U.S. military has indigenous HUMINT collection assets, the battlefield resources of the army are the most operationally diverse. Officially called "human intelligence collectors," army interrogators are primarily soldiers, noncommissioned officers, and warrant officers and are supported by commissioned officers and federal civilian employees in the intelligence field.

They are responsible for interrogating prisoners of war and other detainees, debriefing civilians and friendly forces, and processing captured enemy documents and materiel. At the U.S. Army Intelligence Center at Fort Huachuca, Arizona, interrogators at all levels undergo a rigorous training program in HUMINT collection methodology, applicable U.S. and international law, the order of battle analysis, cultural awareness, and warfighting skills. Some interrogators also receive extensive foreign language training at the Defense Language Institute in Monterey, California. As a result of the Global War on Terrorism, the army's interrogation force will increase to more than 7,000 by 2013, alongside the activation of three new HUMINT collection battalions with dedicated interrogation teams.

Based on wartime experiences in Afghanistan and, later, in Iraq, army interrogators may operate as small, mobile HUMINT collection teams that canvass the battlefield with combat units. They are, however, primarily located at fixed, long-term interrogation facilities—called Joint Interrogation and Debriefing Centers—within larger military detention complexes. Interrogators may be assisted by certified army interpreters or civilian contractors who possess the necessary linguistic and cultural competence for HUMINT operations. Interrogators also work closely with military police, who process and safeguard prisoners of war and other detainees. Although they may provide information on interpersonal relationships, military police personnel are strictly forbidden to participate in or “soften up” individuals for interrogations.

The current version of the U.S. Army Field Manual on interrogation is FM 2-33.3: *Human Intelligence Collector Operations* (2006). It outlines the tactics, techniques, and procedures for conducting successful interrogations under U.S. and international law. Issued in the aftermath of the Abu Ghraib scandal, the manual incorporates many of the hard-won lessons learned from HUMINT collection in counterinsurgency operations during the Global War on Terrorism. Under these new battlefield conditions, FM 2-33.3 reaffirms the importance of rapport-based interrogation techniques. It applies the Geneva Conventions (which concern, in part, the humanitarian treatment of prisoners of war under armed conflict) to all detainees in U.S. military custody regardless of their status. The manual explicitly prohibits the use of torture, coercion,

and humiliation. With the Detainee Treatment Act of 2005 and President Barack Obama's executive order “Ensuring Lawful Interrogations” in 2009, the U.S. government effectively banned all coercive interrogation techniques. Obama's order also established FM 2-33.3 as the legally binding doctrine for the entire U.S. military and all governmental agencies, including the Central Intelligence Agency. The manual is unclassified and available for public distribution.

Interrogation Process

HUMINT collection efforts utilize two types of questioning methodologies on the battlefield: tactical questioning and doctrinally sanctioned interrogation. Tactical questioning is an expedient method of direct questioning, often used after the moment of capture, to gather intelligence information of immediate value. Interrogation, on the other hand, is a carefully orchestrated five-phase process for ensuring that the maximum amount of reliable intelligence information is—successfully, effectively, and lawfully—collected in the least possible amount of time.

The interrogation phases are planning and preparation, approach, questioning, termination, and reporting:

- During the planning and preparation phase, the interrogator reviews the detainee's file and circumstances of capture to prepare an interrogation plan.
- During the approach phase, the interrogator establishes an interpersonal relationship—based on rapport—with the detainee for the purpose of gaining cooperation.
- During the questioning phase, the interrogator systematically questions the detainee and collects information to satisfy the military's priority intelligence requirements.
- During the termination phase, the interrogator completes the questioning session and reestablishes rapport with the detainee.
- During the reporting phase, the interrogator prepares a written report on the intelligence information collected.

The approach is the most crucial phase of any interrogation, because the establishment of rapport—that is, mutual trust and respect—is absolutely

essential for obtaining credible and actionable intelligence information. Interrogators will always first employ the “direct approach,” which involves the straightforward, targeted questioning of the detainee. In U.S. military conflicts from Vietnam to the Persian Gulf, some 90% to 95% of prisoners of war and other detainees fully cooperated with interrogators under this particular method. If the direct approach is unsuccessful and the detainee remains uncooperative, interrogators are trained to use a variety of noncoercive psychological ruses, tricks, and ploys to persuade or pressure detainees into divulging intelligence information. These approaches mostly play on human emotions—love, hate, anger, fear, pride, jealousy—by exploiting a detainee’s weakened emotional state while in captivity. They are conducted under strict adherence to the established protections of the Geneva Convention with regard to the ethical treatment of prisoners of war.

Important differences exist between military interrogations and those conducted in domestic law enforcement operations. Although both procedures use psychologically influenced techniques to elicit information, their goals diverge in crucial ways: Whereas military interrogations are designed to collect reliable information for battlefield intelligence, police interrogations are undertaken to build cases that prove guilt or innocence in a criminal investigation. To these ends, military interrogations are largely framed by the Law of Land Warfare tradition, while police interrogations are governed by constitutional concerns such as the right to silence and counsel.

Interrogation in the Global War on Terrorism

The beginning of the Global War on Terrorism in 2001 posed several unique challenges for the U.S. Army’s HUMINT collection efforts. First, interrogation practices were devised for the large-scale mechanized warfare of the Cold War and not the difficult counterinsurgency and antiterrorist operations in Afghanistan and Iraq. This situation created a tension between the army’s tactical need to collect battlefield intelligence information and the more strategic efforts to identify, track, and question high-value targets for the purpose of crushing al Qaeda’s terror network. Second, considerable confusion arose regarding the legal status of Taliban and al Qaeda personnel taken captive on and off

the battlefield. The decision by President George W. Bush to declare these individuals unlawful enemy combatants—thus denying them prisoner-of-war status under the Geneva Conventions—left interrogators without the support of familiar doctrinal guidance.

These unlawful enemy combatants were relocated to the U.S. military detention facility at Guantanamo Bay, Cuba. During the initial interrogations, many detainees offered a high degree of resistance to traditional interrogation practices. In response to this development, the Bush administration authorized the use of so-called enhanced interrogation techniques. These new techniques included stress positions, sleep deprivation, sensory bombardment, religious and sexual humiliation, and the exploitation of phobias. Many of these practices were reverse-engineered from resistance-to-interrogation methodologies at the U.S. Army’s Survival, Evasion, Resistance, and Escape school. The school’s grueling training regimen introduces military personnel to a variety of coercive interrogation techniques, especially those that could be employed by enemy forces operating outside of the Geneva Conventions. These practices were designed to mentally and physically debilitate a subject to the point of utter exhaustion and submission. They were largely based on well-known Chinese and Soviet interrogation protocols, which were used to brainwash political prisoners into producing false confessions for propaganda value.

Military observers have since argued that enhanced interrogation techniques constitute physical and mental coercion and are wholly incompatible with the prohibition against torture, which has appeared in every army interrogation manual since 1956. Originally authorized for Guantanamo Bay only, many of these practices soon emigrated to military detention facilities in Afghanistan and Iraq. With the exposé of detainee abuse at the Abu Ghraib facility in Iraq in 2004, military interrogations quickly became a topic of national public concern. This and other revelations prompted a number of high-profile governmental disclosures, congressional inquiries, military investigations (e.g., the Fay and Taguba Reports), and executive orders that severely criticized—and eventually banned—the use of enhanced interrogation techniques.

Former and current interrogators continue to assert that coercion and torture not only are unlawful interrogation methods but also are highly

ineffective for HUMINT collection. According to these experts, torture produces false, misleading, and unreliable intelligence information; exposes captured U.S. personnel to greater risk of enemy abuse; and discredits the moral authority of the United States. Some controversy remains today as to whether the abuse of detainees was deliberately sanctioned—*carte blanche*—by the U.S. government or largely the result of a “few bad apples” acting on their own accord. Subsequent military investigations have tended to blame these abuses on inadequate interrogation training and the lack of clear command responsibility at detention facilities. A number of detailed memoirs by U.S. Army interrogators in Afghanistan and Iraq have also been published in the wake of Abu Ghraib, most notably Chris Mackey’s *The Interrogators*. These texts reiterated the importance of noncoercive, rapport-based interrogation techniques and the effectiveness of highly imaginative psychological ruses, tricks, and ploys for eliciting intelligence information.

IRAN

Among the countries in the Middle East, Iran has one of the longest histories and strongest identities as a separate nation, with its own culture and traditions. Throughout the centuries, its leaders have shown a willingness to endure great costs to repel foreign invaders and maintain Iran’s identity. The Iranian Revolution of 1979 led to a religious dictatorship that has used its militias to crack down on internal dissent, in recent years most visibly during protests of the disputed presidential election of 2009. Concerns regarding Iran’s nuclear program has led to the intensification of Western economic sanctions, which have had a debilitating effect on Iran’s economy. They have also led to threats by Israel to launch a preemptive airstrike on Iran.

Historical Background

Throughout most of its history, the geographical area that is modern Iran was known as Persia. It has existed as a national society with a distinct national identity and culture for approximately 5,000 years. In the 7th century, Arab armies marching in the name of Islam conquered a vast area from Central Asia to North Africa, including Persia. However, although the Persians adopted Islam, they refused to abandon their national identity. Persia never adopted Arabic as its national language, although it adapted the Arabic script to the Persian language. By the 9th century, Persia had regained its

independence. Islam was the state religion, but the country was once again an independent state ruled by Persian rulers.

By the 16th century, Iran had once again become an empire, under the Safavid dynasty, which successfully repelled attempts by the Ottoman Empire to add it to its list of conquests. Successive dynasties were unable to prevent growing incursions into Iranian territories by the ascending European powers, especially Imperial Russia, which in a series of wars occupied a large area of Persian territory. In the 18th century, an enfeebled Persia got caught up in the “great game” between Russia and Britain, losing more northern territory to Russia and its holdings in modern-day Afghanistan to Britain. The last dynasty to rule Iran, the Pahlavis, took power in 1925, when Reza Pahlavi, an officer in the Iranian army, mounted a successful coup against the Qajar dynasty. He renamed the country “Iran,” and instituted a vast and ambitious program of rapid modernization. He got the foreign aid and expertise he needed primarily from Germany, the one European power with which Iran had never had an adversarial relationship, since it had never been part of the great game between Russia and Britain. In 1941, Russia and Britain invaded the country, forcing the shah to abdicate in favor of his son Mohammed Reza Pahlavi, who agreed to allow British technical experts to replace the Germans and to allow Iran’s railroads to be used to ferry lend-lease supplies to the Soviet Armies fighting the Wehrmacht.

In 1951, the Iranian prime minister, Ali Razmara, was assassinated. The parliament elected Mohammad Mossadegh, whose appointment was ratified by the shah. Unwilling to accept a British diktat, Mossadegh nationalized the oil industry. President Dwight D. Eisenhower supported the British prime minister, Winston Churchill, in his efforts to force the Iranian authorities to accept cut-rate royalties from BP by embargoing Iranian oil. When this did not succeed in deterring Mossadegh, the United States and Britain helped engineer a coup that overthrew Mossadegh and allowed the shah to rule the country as an absolute monarch. This was the first time the United States had overthrown an elected, civilian government.

The shah initiated a series of far-reaching economic and social reforms, including land redistribution that

benefited the peasantry; he increased industrialization and established a degree of secularization that did not exist in any other predominantly Muslim country, with the possible exception of Mustafa Kemal Ataturk’s Turkey. However, these moves alienated the country’s religious leadership and the conservative merchant class, the so-called Bazaaris. At the same time, corruption and the shah’s growing despotism alienated members of the growing educated middle class, who should have been his biggest supporters. The ruthlessness with which he crushed any political dissent, especially the notorious culture of torture that characterized the feared SAVAK (the secret police), made him a hated figure among vast swaths of Iranian society.

Ayatollah Ruhollah Khomeini assumed the leadership of the opposition. In 1964, after having been under arrest for 18 months, he was exiled. After living briefly in Turkey and Iraq, he settled in Paris, from where he continued to build the opposition to the shah in Iran.

The Islamic Revolution

In January 1978, after more than a decade in exile, Khomeini felt that the time was ripe for him to strike. On his instructions, waves of major demonstrations and strikes against the shah erupted. By January 1979, the country and its economy had become totally paralyzed by strikes. President Jimmy Carter, who regarded the shah as a cruel and ruthless despot undeserving of American support, pressured him not to order his security forces to mow down the demonstrators. Dissent morphed into rebellion, the shah abdicated and fled, and Khomeini returned from exile. Three weeks later, the Pahlavi Dynasty collapsed when Iran’s military declared itself “neutral” after guerrillas and rebel troops overwhelmed troops loyal to the shah in armed street fighting.

By the end of 1979, a theocratic constitution had been approved, with Khomeini declared the supreme leader. Shortly afterward, the clerical establishment turned with a vengeance on the nationalists and Marxists who had joined forces with them to overthrow the shah, executing thousands.

Immediately following the revolution, relations with the United States, which had been Iran’s main ally, rapidly deteriorated. On November 4, 1979,

Iranian students occupied the American embassy in Teheran. U.S. diplomats were held hostage for more than 400 days, before being released in January 1981. The United States and Iran have not maintained formal diplomatic relations since this incident.

Iran-Iraq War

In 1975, Iraq was forced to sign a treaty in which Iran agreed to cease supporting Kurdish rebels fighting for independence from Iraq in exchange for Saddam Hussein's agreeing to a disadvantageous redefining of the border with Iran along Shatt al Arab River. Following the Iranian Revolution, Saddam saw an opportunity to regain this lost territory and inflict a punishing blow on Iraq's neighboring adversary. Saddam Hussein invaded Iran in September 1980, capitalizing on the weakness of the Iranian armed forces in the wake of the revolution. The powerful Iranian military had lost much of its trained officer corps, because its members had been predominantly royalist and were in exile, in prison, or dead.

Saddam's initial aim was to force the ayatollahs to accept a humiliating peace treaty that would restore the territories Iran had acquired from Iraq and to annex the oil-rich Iranian province of Khuzestan, which has a predominantly ethnic Arab (not Persian) population. His ultimate strategic goal was to weaken the regime to the point where it could be overthrown.

It is important to understand the fear and loathing with which Arab nationalist leaders regarded the very idea of an Islamic Republic. Arab nationalism was a new phenomenon. In most of the Arab states colonizers created, a minority was able to grab control: in Lebanon the Christians, in Jordan the Bedouins, in Syria the Alawis, and in Iraq the Sunnis. These regimes, unpopular with the majority of the nations' citizens, tried to legitimize themselves by encouraging and fostering a sense of nationalism and a national society. This came at the expense of Islam, the historical anchor of Arab society. Until the 20th century, *Arab* had been primarily a cultural and linguistic term, not one that referred to national identity. In all the Arab countries in which secular nationalist movements gained power, the Muslim Brotherhood and other Islamic movements were regarded as a major threat and ruthlessly persecuted.

No country was more threatened by the Iranian Shiite Islamic Republic than Iraq, which was ruled by the ultrasecular and nationalist Baath party, dominated by the minority Sunnis. Iraq was by far the most fractured of all the Arab countries, with probably the least cohesive society of any Arab country. The fact that the Sunni minority ruled Iraq's predominantly Shiite population made things even worse. Saddam hoped that a quick victory over Iran would enhance the legitimacy of his regime among his own people and other Arab states and remove a potent threat to him and every other secular-nationalist Arab regime.

Saddam miscalculated. The clerical establishment headed by Khomeini was able to galvanize public support for the regime following Saddam Hussein's decision to invade. Iranian society may have begun growing weary of their stifling theocracy, but as a mature, proud, and cohesive society, they rallied around it to meet the threat posed by the invader. Although the Iranian military was in dire straits, short of weapons and trained troops and commanders, it had overwhelming numbers of troops, outnumbering Iraq 5:1. By 1982, the Iranians had succeeded in blunting the Iraqi advance, and a stalemate ensued. Gradually, they began to slowly drive the Iraqis back in a grinding war of attrition in which they lost almost 1 million troops, more than 10% of them the victims of Iraqi chemical warfare. In 1988, the mutually exhausted countries agreed to a cease-fire.

Following the end of the war in 1988, the Islamic Republic faced a political crisis when Khomeini died in 1989. Akbar Rafsanjani, a wealthy and prominent member of the conservative merchant class, with a reputation as a can-do businessman and technocrat, was elected president, and he initiated a series of programs to expedite economic recovery from the war. In 1997, Rafsanjani was succeeded by Mohammed Khatami. In 2005, Khatami's successor, Mahmoud Ahmadinejad, took office; he won a second term that ends in 2013.

Iranian Armed Forces

Over the past three decades, the Iranian military has undergone a complete transformation. From 1921 until 1979, it was a Western-based military, using exclusively Western-made weapons systems and trained according to Anglo-American doctrines. The

Islamic Revolution and the resulting deterioration of relations with the West in general and the United States in particular forced the military to reinvent itself. It currently purchases most of its equipment from Russia and China and is increasingly self-sufficient, thanks to the rapidly growing capabilities of the domestic defense industry.

The Iranian armed forces consist of the Iranian military and the Pasdaran. The Iranian military is made up of the Islamic Republic of Iran army, the Islamic Republic of Iran navy, and the Islamic Republic of Iran air force. The Pasdaran, also known as the Guardians of the Islamic Revolution or Iranian Revolutionary Guard Corps, constitute a separate military structure created by the ruling party. Unlike the regular military, their sole mandate and loyalty are to the regime, not the state or society at large. The corps includes the Basij militia and has its own ground forces, air force, navy, intelligence, and special operations units.

The Iranian army has a total strength of 815,000, with 465,000 serving as regulars. Conscription of young males provides a significant source of the army's manpower. The AK 47 (Kalashnikov) is the standard infantry weapon. The Iranian military uses original, Soviet-made AKs; the Type 56, a Chinese knockoff; and, increasingly, a locally manufactured version (copied from the Chinese), the KL7. Other infantry assault rifles and machine guns in common use include the MP5, the locally manufactured version of the Heckler & Koch Tondar submachine gun; MG3 and PKM machine guns; and the SVD sniper rifle. Most of these weapons are produced locally under license from companies that own the patent/weapon system.

The Iranian army has approximately 15,000 armored personnel carriers—mostly Russian-made BMTs and locally made BMRs. Some U.S. M113s are still serviceable. In terms of tanks, the army still possesses a number of American-made M47/78 and Pattons, and British-made Chieftains that were acquired under the shah. More recent additions include the Russian-made T-72 and T-62 and the North Korean Chonma Ho, which is an upgraded version of the Soviet-era T-55.

Iranian ground forces have several thousand tactical missiles, mostly various models of the Fajar missile, a locally made missile based on the Soviet-era Katyushas, Grads, and Frogs. The range of these weapons can be anywhere from 25 to 75 kilometers.

Iranian ground forces operate their own helicopter forces, independently of the air force. These include 80 U.S.-made Sea Cobra attack helicopters and more than 200 transport helicopters, the most common one being the Bell 205.

The Iranian air force comprises 52,000 men and is generally acknowledged as the weakest branch of the armed forces. During the Iran-Iraq War, the Iranian air force possessed a fleet of American aircraft (e.g., F-4 Phantoms, F-5s, and F-14 Tomcats), which proved ineffectual due to maintenance problems. The air force has 24 F-1 Mirage and 40 MiGs in service. Since 1979, the Iranian government has sought to diversify the fleet by acquiring F7Ms—a Chinese knockoff of the MiG 21—and has 17 in service. The air force has also received between half a squadron and a squadron of the locally produced Saeq and Azarkash multirole/ground attack aircraft. The air force operates approximately 50 transport helicopters, 10–15 air refueling aircraft, a motley fleet of approximately 100–120 transport aircraft, and 5 P3 maritime patrol aircraft.

The country's air defense system is a mixture of locally upgraded missile batteries based on the U.S. Hawk and more modern Russian and other East European equipment. Iran claims to have succeeded in deploying two Belarus or Ukrainian-supplied SS 300 anti-aircraft batteries, purchased on the international black market; these claims are yet to be verified.

The Islamic Republic of Iran navy is the smallest of the Iranian military's services, with a total of 28,000 officers and men. Prior to the 1979 revolution, the navy had been in the early stages of building a force of U.S. surface ships capable of projecting Iranian naval power in the Indian Ocean. The Islamic revolution ended this program. Realizing that it cannot hope to match U.S. sea power, the Iranian navy's task is to protect Iran's ports and coastal waters. Its sole offensive mission is to block the Strait of Hormuz, choking much of the world's oil supplies, which pass through the narrow strait. Its home port is Bandar Abbas.

The navy does possess a fleet of submarines that includes 3 *Kilo* class (Russian), 4 *Yugo* class (North Korean), and 1 *Nahang* and 11 *Ghadir* class, both produced domestically. Three American-built destroyers remain in the fleet but are not currently operational. The navy has three British-built *Alvand*-class frigates and two domestically produced

Moudge class. The navy also possesses a significant number of smaller craft, including 24 missile boats. The Chinese-built *Houdong* class weighs 171 tons, has a top speed of 35 knots, and is armed with 4 C802 SSMs; and the Iranian-built *Sina* class weighs 275 tons, with a top speed of 36 knots, and is armed with 4 C802 SSMs.

Pasdaran (Islamic Revolutionary Guards)

As mentioned above, the ultimate loyalty of the Pasdaran is to the regime, not the state. It has a separate command structure and is ultimately answerable to the supreme leader, not the chief of staff or the Ministry of Defense. It has approximately 120,000 fighters, all professionals. The Pasdaran is considered to be better trained and equipped than the regular army. Its doctrine is to serve as a rapid response force, capable of rapid deployment in the event of the regime being threatened internally or externally, or to intervene on behalf of Iran's regional allies, primarily Syria, Hezbollah, and Hamas. It has its own air force and navy, and a large special operations (Quds) unit. This 15,000-strong special operations unit has been deployed in the Balkans, Lebanon, Latin America, the Far East, and Africa to train and equip pro-Islamic, anti-Western forces.

The Pasdaran controls Iran's clandestine nuclear program and its strategic surface-to-surface missile force, the country's main long-distance strategic offensive arm. This force's most potent weapons are its 18 mobile, 3,200- to 4,000-kilometer-range Musudan ballistic missiles, based on the Soviet R27 Zyb. The Pasdaran's arsenal also includes the Fajr-3, a 2,000-kilometer-range multiple independent reentry vehicle (MIRV) ballistic missile. It is probable that this name has been given to MIRVed versions of several Iranian missiles with similar range and capabilities, including the Shahab 3, a 2,000-kilometer intermediate-range ballistic missile. Other nuclear-capable missile systems include the Ghadr 110, a 2,000-kilometer-range missile; the Ashoura, a solid-fuel version of the Shahab, developed in cooperation with Pakistan; and the Sajjil, an improved version of the Ashoura, with a lower set-up time. Other improvements to the Sajjil include a better navigation system, a better targeting system, more payload, longer range, faster lift-off, longer storage time, quicker launch, and lower detection possibilities.

The Pasdaran's shorter range missiles and rockets include AS-15 Kent Soviet-era cruise missiles; the Nasr 1, an Iranian-made short-range antishipping cruise missile; the Zelzal, an Iranian-made heavy-artillery rocket based on the Soviet Frog, capable of delivering a 600-kilogram warhead 200 kilometers; and the Fateh-110, an Iranian-built (based on the Chinese DF 11A) single-stage, solid-propellant, surface-to-surface missile with at least a 200-kilometer range, capable of carrying a nuclear warhead.

The Basij constitute a 400,000-strong militia. It acts as the regime's storm troopers—shock troops to quell civil unrest. It is under Pasdaran command. The Basij was founded in 1980 to recruit hundreds of thousands of untrained youth to fight in the Iran-Iraq War, most of whom died in suicidal human-wave attacks designed to clear the way for the more professional forces behind them. After the war, the Basij was reorganized as a militia to enforce Islamic dress codes and other religious laws and to be ready to intervene on the streets in any case of protest or dissent against the regime. The Basij was instrumental in crushing the postelection protests in 2009.

Most Basijis are part-timers. They receive some military training and are required to be called up on short notice. In case of major disturbances, a reservoir of up to 1 million reservists can be called on. The Basij has also developed major economic interests and owns a string of companies involved in almost every aspect of Iranian economic life, a model adopted from the Chinese army.

Iran's Clandestine Nuclear Program

Iran began to develop its nuclear program under Shah Mohammad Reza Pahlavi. The program was purely civilian in nature. It was suspended after the Islamic Revolution but was restored shortly thereafter. Until 1988, it remained primarily civilian in scope, since Khomeini, who abhorred the idea of nuclear weapons, had issued a fatwa against them. After Khomeini's death, the Pasdaran high command convinced the new supreme leader that Iran needed nuclear weapons to ensure the regime's survival, following the North Korean example. A clandestine program, designed to give Iran nuclear weapons capability, was implemented.

On becoming president, Ahmadinejad expedited this program. Nuclear facilities were dispersed all over Iran to prevent an Israeli attempt to destroy

the facilities with an attack similar to the one Israel launched on the Osirak nuclear reactor in Iraq in 1981. To further inhibit an attack, the facilities were all built deep underground. Despite the hardening of these facilities, they have not been impervious to attack. Reliable reports indicate that in the early 2010s, the American and Israeli intelligence services were able to plant a virus into the computer systems controlling the centrifuges in a key enrichment facility, destroying a number of them. Iran has sought to minimize the damage caused by this and other cyber attacks.

Concern over whether Iran has the capacity to build nuclear weapons has promoted an increasingly effective effort to impose sanctions by the United States and the United Nations. Economic sanctions against Iran were first implemented by the United States in response to the Islamic Revolution of 1979, but they were considerably strengthened in the 1990s in response to Iran's support for international terrorism and in the 2000s in response to Iran's clandestine nuclear program. Essentially, U.S. sanctions ban any investment or trade with the Iranian regime by an American citizen or company, with only limited exemptions for items such as food and medicine. The United Nations first implemented sanctions under Security Council Resolution 1737 (2006) and reaffirmed them with Resolutions 1747 (2007), 1803 (2008), and 1929 (2010). These sanctions are weaker than those imposed by the United States and ban countries from supporting Iran's nuclear enrichment system as well as from selling major weapons systems to this nation.

These sanctions have cut Iranian revenues from petroleum exports as well as isolated it from much of the international financial system. By 2012, they led to a dramatic depreciation in the Iranian national currency, making it increasingly difficult for Iran to pay for vitally needed imports. Although the United States does not purchase Iranian oil, a number of nations have been unable to end their dependence on oil from this nation, most notably Japan.

Clashes have publicly emerged between the United States and the State of Israel regarding how to respond to the current nuclear program and the wisdom of launching a preemptive military strike to inhibit Iran's nuclear capability. At least publicly, Israeli leaders have called for such action to forestall even the possibility of Iran acquiring nuclear weapons. Under President Barack Obama, the United

States has not only sought a diplomatic solution but also moved to intensify sanctions against the Iranian regime.

IRAN-CONTRA SCANDAL

The Iran-Contra scandal came to light in November 1986, when it was revealed that the National Security Council (NSC) and Central Intelligence Agency (CIA) had undertaken secret arms sales to Iran. The profits from the sale of American weapons were funneled to rebel Contra forces in Nicaragua. Officially, the United States was an active partner in a worldwide weapons embargo on the Islamic Republic of Iran. Additionally, several acts of Congress prohibited U.S. support of the Nicaraguan Contras.

Iran: The Problem

Iran's radical clerical regime had a direct hand in a series of anti-American actions that began in November 1979, when Iranian students and militants stormed the U.S. embassy in Tehran and captured 52 American diplomatic personnel. Iranians held these Americans hostage for 444 days, before releasing them in January 1981.

Two years later, Iranian-backed forces attacked American interests in Lebanon. In April 1983, with money and direction from senior Iranian officials, Hezbollah orchestrated a suicide bombing of the

U.S. embassy in Beirut. A truck full of explosives detonated directly under the CIA's embassy-based offices, wiping out many of America's intelligence assets in the region and killing 63 personnel. In October 1983, Hezbollah blew up a U.S. Marine barracks in Lebanon, killing 241 Americans. In March 1984, Hezbollah captured America's CIA station chief in Lebanon, William Buckley. Over the course of the next 15 months, Hezbollah tortured Buckley and sent the gruesome videotapes of Buckley's long agony to the CIA. Iran also backed a series of kidnappings of Westerners in Lebanon during the course of the mid-1980s.

Given the death and mayhem visited on American interests by Iran, why, beginning in 1984, did the White House make a series of overtures to Iran?

The answer is twofold. First, President Ronald Reagan was genuinely moved by the plight of Western hostages held by Iran's allies in Lebanon. Second, the president was persuaded that Iran could be reenlisted as a Cold War ally. U.S. actions, however—the secret transfer of 2004 TOW anti-tank missiles and 18 airborne HAWK missiles—contradicted an ongoing State Department campaign to embargo transfers of arms to Iran. The arms transfers were also at odds with stated American policy. At a news conference in June 1985, Reagan declared, “America will never make concessions to terrorists. . . . Once we head down that path there would be no end . . . to the bloody ransom all civilized nations must pay.”

The transfer of arms to Iran also seemed to contradict ongoing American support for Iraq. When weapons sales to Iran began, more than 60 American officers were in Baghdad advising Iraq on how to prosecute a war Saddam Hussein had begun with Iran in early 1980.

Elements of the arms transfers to Iran were the stuff of dark comedy. High-level Americans appeared in Tehran bearing gifts, including a chocolate cake baked in the shape of a key (as in the key to good relations). Americans also offered the Iranians a Bible bearing Reagan's personal signature. Americans secretly flew to Tehran in transports laden with weapons, accompanied by a coterie of high-level Israeli intelligence officers. Three American hostages were released before this arrangement became public.

In early November 1986, details of the weapons transfers were printed on broadsheets and distributed by pro-Iranian agents in Lebanon. Oddly,

weeks after the revelations, parts of the plan lurched along. The State Department—long the leader of attempts to isolate Iran—appeared grievously compromised. On November 16, 1986, Secretary of State George Shultz confessed to an incredulous interviewer on *Face the Nation* that he could not speak with authority about U.S. policies toward Iran since he was unsure what they were.

With Shultz's statement, the president was forced to end NSC- and CIA-backed activities in Iran. The heads of the NSC and CIA soon resigned. Other high-level resignations throughout the national security community soon followed.

The Law, the President, and the Contras

The diversion of monies from the sale of American weapons to Iran was consistent with the president's repeated desire—as a report to Congress later put it—“to take action unilaterally to provide assistance” to the Contras and to “confront the Congress on the constitutional question of who controls foreign policy.” Ronald Reagan came into office determined to take a hard line against the Soviet Union and had little tolerance for the Sandinista regime of Daniel Ortega, which had come to power in Nicaragua in 1979. The Reagan administration immediately cut off foreign aid to the Sandinista regime and condemned the regime for its links to communist Cuba. Reagan ordered the CIA to foster the rise of an opposition movement—the Contras—that engaged in armed struggle against the Sandinistas.

Contra aid was the most problematic. In January and February 1984, the CIA secretly mined Nicaraguan harbors. Ten ships, six belonging to U.S. allies, were damaged. Congress had not been informed. Republican Barry Goldwater wrote CIA director William J. Casey a letter stating that he was “pissed off” that an “act of war” had been committed by the CIA without congressional consultation. Tired of reports that the Contras had involved themselves in drug smuggling, human rights abuses, and thuggish havoc, Congress cut off U.S. funding in a law signed by the president in late 1984.

But the law did not inhibit assistance from U.S. allies. Taiwan, Chile, Guatemala, El Salvador, and Honduras contributed weapons, money, and logistical support to the “Enterprise,” as the operation to help the Contras became known. The Sultan of Brunei gave money. The Taiwanese and Koreans anted up. The Saudis contributed. The Israelis ran

a huge operation supplying arms to the Contras. Some of the “private” Contra supply support teams were abetted by Panama’s General Manuel Noriega. In getting support to the Contras, some funds and payoffs seem to have involved illegal drugs. Nearly all of the Contra’s supply efforts appear to have been orchestrated by the CIA.

The Investigation

The revelation in November 1986 of U.S. arms sales to Iran and the diversion of those profits to the Contras led to immediate calls for a special prosecutor and congressional investigations. Lawrence Walsh served as special prosecutor, independent of the Department of Justice; a House-Senate investigative committee was impaneled in 1987. Senator Daniel Inouye served as chair and Senator Warren Rudman as vice chair.

Politically, congressional Democrats focused much of the scandal on the funding of the Contras, which many argued was a clear violation of statutory law. Surprisingly, less attention was paid to the dubious decision to sell arms to a regime that had humiliated the United States during the hostage crisis of 1979–1981. Moreover, in the same period, the United States was providing substantial aid to the Iraqi regime in its war with Iran.

The Iran-Contra scandal raised a fierce debate over the constitutional role of the president in shaping foreign policy and as commander in chief. The Reagan administration and its allies insisted that the president had the inherent right under the Constitution to encourage other countries to support the Contras despite congressional prohibitions on spending U.S. governmental funds to assist them. Civil-military issues were also raised due to the fact that key members of the administration were current or former officers of the armed forces. National Security Advisor Robert McFarlane was a retired Marine Corps lieutenant colonel, and his successor, John Poindexter, was a U.S. Navy rear admiral. A Marine Corps officer detailed to the NSC staff, Colonel Oliver North played an instrumental role in orchestrating the arms sales and diverting the funds.

Politically, the public hearings backfired on congressional critics of the Reagan administration. North offered a masterful defense of his actions, arguing that those actions served the national interest and that he was essentially following the orders of his superiors. The hearings made North a cult

hero in many circles and launched him on a successful career in the media. Vice Admiral Poindexter accepted responsibility for the Iran-Contra scandal and absolved Reagan of any personal responsibility. If the initial testimony of Reagan’s NSC advisor was accurate, Poindexter, in particular, calculated what Reagan really would have done if he had been informed and not constrained by the law.

How Reagan could condone actions so contradictory to his own publicly stated positions puzzled observers. Later, a number of the president’s aides explained that Reagan forgot what U.S. policy was, did not know what was going on, or did not understand what his administration was doing. The president’s chief of staff, Donald T. Regan, blamed it on the president’s NSC staff. NSC staffers had told the president so many cover stories that, according to Regan, it “sort of confused the presidential mind.” Reagan bristled at suggestions that he was not in charge, however, and the Iran-Contra scandal contributed to his decision to fire Regan as chief of staff.

Investigations by a panel appointed by the president, the special congressional panel, and the special prosecutor never took the president to task for anything more than not understanding that helping the Contras was “incompatible” with the law (as the independent prosecutor put it in his long-awaited 1992 report). Moreover, the decision to grant several officials immunity in return for their testimony made it difficult to secure convictions in criminal court.

In the end, 14 people were charged with criminal offenses in the Iran-Contra affair. Eleven were convicted, but two convictions were overturned on appeal. Only one official served time in prison—Thomas G. Clines—and that was for not reporting to the Internal Revenue Service income he derived from abetting the arms sales to Iran. President George H. W. Bush pardoned six officials (Elliott Abrams, Alan D. Fiers Jr., Clair E. George, Robert C. McFarlane, Duane R. Clarridge, and Caspar Weinberger). One case was dismissed when the Bush administration refused to declassify information necessary for trial. The rest were ordered to pay a fine, perform community service, or serve probation.

Iran-Contra and Executive Power

The Iran-Contra affair shaped the views on presidential power of members of the administration of President George W. Bush. In 2005, in response to

a reporter's question about his views on presidential power, Bush's vice president, Dick Cheney, tried to put administration policies in context and commented,

Nobody remembers it now, but you should take a look at the minority [position] . . . as reflected in the Iran-Contra Report. . . . [It is] a robust view of the President's prerogatives with respect to the conduct of especially foreign policy and national security matters.

The House 1987 minority investigative report said that the great executive "mistake" in the Iran-Contra matter was Reagan's "less-than-robust defense" of his inherent powers. The minority House report specifically cited President Reagan's failure to exert executive privilege in the face of Congress's investigation. This view was controversial when it was asserted in 1987, and no consensus has emerged on this issue.

IRAQ

Iraq (from *Eraq*, an ancient Semitic word for lowlands) is the Arabic term for the area known in the West as Mesopotamia (the land between the rivers). It was the existence of these two rivers (Euphrates and Tigris) that enabled what would otherwise have been barren desert to become one of the cradles of civilization. This entry briefly reviews the history of Iraq and its evolution as a modern state.

Historical Background

By 4000 BCE, farming was already widespread, and by 3000 BCE, Sumer, the first of several empires that were to control the area, had developed. Between 3000 BCE and 500 BCE, several empires, mostly Semitic states, ruled the area. The best known of these are Babylon and Assyria.

In 530 BCE, Babylon was defeated by the Persians, who incorporated Mesopotamia into their empire, bringing to an end the age of Semitic ascendancy

in the region. Following the defeat of the Persian Empire by Alexander the Great, Mesopotamia came under Hellenistic rule for two centuries. The Persian Parthian dynasty conquered Mesopotamia around 150 BCE, and by 150 CE, Mesopotamia was firmly under Parthian control and remained so until the Islamic conquest in the 7th century CE.

In 750 CE, the Abbasids, in the name of Shiite Islam, overthrew the Sunni Umayyad dynasty. Their claim to legitimacy was that they were direct descendants of Mohammed and thereby had the right to rule (the Umayyad family, although an old Arab family, had no genetic link to Mohammed).

Shortly after their success, the Abbasids embraced Sunni Islam and eliminated those of Mohammed's descendants whom they could not directly link to their branch of the family. This created an intense feeling of betrayal among the Shiites, in whose name the Abbasids had overthrown the Umayyads, intensifying the rift between the Sunnis and Shiites in Iraq. For five centuries, the Abbasid Caliphate ruled from Baghdad. In the 13th century, the caliphate was conquered by Hulagu Khan, Genghis Khan's grandson. In 1517, Mesopotamia formally became a province of the Ottoman Empire, which fought a series of border wars with Persia during the 17th and 18th centuries over control of the area.

Modern Iraq

In 1918, Mesopotamia came under British imperialist rule, following the defeat and dismemberment of the Ottoman Empire. In 1932, facing a growing insurrection, the British ostensibly granted Iraq its independence, installing Feisal as King Feisal the First. A Sunni Arab, Feisal ensured that the new country would be dominated by Sunni Arabs, despite the fact that they were the smallest of the three major ethnic groups. The Shiites (the largest ethnic group) and the Kurds (Sunni Muslims but not Arabs) were politically and economically marginalized. In 1958, a group of officers, inspired by Egypt's Free Officers Movement, mounted a coup, and Iraq became a republic.

Baath Rule

The Baath party was founded in Syria in 1947 by a group of secular socialist intellectuals, several of whom were from the minority Christian and Alawi groups. In 1963, it succeeded in mounting coups in

both Syria and Iraq. Although a Pan-Arab movement, the party gradually adopted a more country-specific nationalism.

The main threat to the Baath regime came from the Kurds, who were the majority group in northern Iraq. In 1960, the Kurds, seeing their demands for regional autonomy ignored, rebelled against the Iraqi regime and by the late 1960s had achieved a de facto though unrecognized autonomy.

In 1968, the Baath party regained control of Iraq and renewed the war against the Kurds. The Kurds, supported by the United States and Israel, which supplied them via their mutual ally Iran, were able to hold their own. In 1975, Saddam Hussein, who had emerged victorious from an internecine power struggle within the Baath party to become the sole ruler of Iraq, negotiated a deal with Shah Mohammad Reza Pahlavi of Iran, agreeing to Iranian demands for border rectifications along the Shatt al Arab River in return for Iran ceasing to supply the Kurds. The Kurdish resistance collapsed, and over the next 10 years approximately 100,000 Kurds were killed and more than 200,000 were arrested and/or forcibly relocated to reduce their presence in and around Mosul and Kirkuk.

Buoyed by his success against the Kurds, the Iraqi leader sought to reestablish Iraq as the pre-eminent Arab power, a status it had not enjoyed since Baghdad's Medieval Golden Age. In 1977, he embarked on a clandestine nuclear arms program, which ended when Israel bombed the Osirak reactor in 1981.

Iran-Iraq War

In 1979, Ayatollah Ruhollah Khomeini toppled the Shah of Iran. Iran was no longer a pro-Western kingdom but a radical, anti-American Islamic republic. Relations with the United States, which had been Iran's main weapons provider, were soon ruptured, leaving the Iranian armed forces significantly weakened as the United States ceased all supplies of arms and spare parts to Iran. In addition, Khomeini purged the officer corps, which was primarily secular and pro-Western, which he did not trust, and which he feared might launch a coup. Thousands of senior and midranking officers were either executed or purged and had to flee the country, further weakening the Iranian armed forces, especially its air force.

Saddam Hussein understood immediately that the Iranian revolution posed a major threat to Iraq, which had been under the firm control of its Sunni minority, which had marginalized, exploited, and oppressed the country's Shiite population, its largest ethnic group. The idea of a Shiite Islamic republic actively pursuing a Shiite resurgence on his border was anathema to Saddam Hussein and the entire Iraqi Sunni establishment.

Deciding that his best opportunity to bring down the Islamic republic was while its armed forces had not yet recovered from the purge and the loss of American supplies, Saddam issued Iran an ultimatum on September 17, 1980, demanding territorial concessions. Five days later, his forces invaded Iran. Iraq hoped to exploit Iran's military weakness to gain full control of the Shatt al Arab (Arvand) River, acquire the three islands of Abu Musa and the Greater and Lesser Tumbs, annex the predominantly Arab Khuzestan (Arabistan) province, and force Iran to sign a humiliating peace treaty that would facilitate the fall of the Islamic regime.

Initially, it seemed that Saddam's plans would succeed. Caught by surprise, the disorganized and still weakened Iranian forces retreated before the superior Iraqi formations. The Iranian air force, short of trained pilots and operational aircraft, ceded air superiority to the Iraqis.

However, despite the poor state of its armed forces, Iran had two strategic advantages: (1) its large size (at 640,000 square miles, it is approximately 50% larger than Iraq) and (2) its population, which was more than thrice the size of Iraq's (approximately 70 million compared with Iraq's 20 million). In addition, its mountainous terrain enabled the defending forces to neutralize Iraq's superiority.

Within a few months, what had looked like an Iraqi cakewalk became a morass. Like the USSR fighting Germany in 1941, Iran traded space for the time it needed to build a defensive network of trenches and minefields capable of blunting the Iraqi advance. In addition, Iran used human-wave tactics to overrun Iraqi forces through sheer weight of numbers. The Iraqi forces lacked the logistical capabilities required to successfully invade a country as large and as rugged as Iran. Within 6 months, the Iraqi invasion had stalled, and by the end of 1981, the morale of the Iraqi forces had plummeted, enabling Iran to take the initiative.

In March 1982, Iran launched a major offensive. By June, the Iraqi forces had withdrawn from Iranian

territory, and Saddam asked the USSR to broker a cease-fire. Khomeini, encouraged by his military victories, refused, pledging not to end the war until the secular Baath regime had been eliminated and Iraq was ruled by the Shiite majority. In July 1982, Iranian forces crossed the border into Iraq.

Within a few weeks, the Iranians discovered that attacking was a far more difficult and demanding task than defending. For more than 6 years, a bloody stalemate ensued, as the Iranian forces got bogged down before Iraqi defenses. The Iraqi forces showed much higher morale defending their country than they had when invading Iran, and now they enjoyed the logistical advantages of fighting on home ground.

The Iranians tried to use the human-wave tactics to overcome the Iraqi defenders but were repulsed by the Iraqi forces. During this stage of the war, the Iraqi forces resorted to major use of chemical warfare to break the Iranian human tidal waves assaulting their positions. Both sides sought to break the stalemate by attacking each others' major cities and economic targets but were unable to do so. In August 1988, both sides, having mutually exhausted each other, accepted a UN-brokered cease-fire, effectively ending the war.

Persian Gulf War

The end of the war found Iraq in dire economic straits. By the end of 1982, Iraq faced bankruptcy. The stalemated war had severely affected its oil exports, the country's main source of revenue. Much of the country's infrastructure had been destroyed, and the defense budget had ballooned. In 1979, the Iraqi armed forces numbered approximately 200,000; by the end of the war, it could field almost half a million troops.

Saddam Hussein was saved by his oil-rich Sunni neighbors Kuwait, Saudi Arabia, and the United Arab Emirates, which provided loans and grants to keep the Iraqi economy afloat and enable it to significantly increase military spending. These countries, all conservative monarchies, had no love for the revolutionary secular Baath party that ruled Iraq. But as much as they disliked Iraq, they feared and despised Shiite Iran much more.

After the war, both Saudi Arabia and Kuwait started pressuring Saddam to repay the war debts he owed them. Saddam refused, claiming that he had been protecting the interests of the entire Arab-Sunni

world and that the loans should become grants as the two countries' contribution toward keeping a dangerous foe of the entire Sunni world at bay.

Saddam held a particular grudge against Kuwait. He demanded that Kuwait write off Iraqi war debts and accused it of exceeding its OPEC (Organization of the Petroleum Exporting Countries) quotas at Iraq's expense. Saudi Arabia, eager to avoid a crisis, hosted talks between the two countries, but on July 19, 1990, the talks broke down acrimoniously. On August 2, Saddam's forces crossed the border. Kuwait's relatively puny military forces were unable to put up much resistance. Within a week, the royal family had fled, barely escaping the Iraqi forces entering Kuwait City. By the end of August, Kuwait had been "reunited" with Iraq and had a new provincial governor, Saddam's cousin Ali Hassan al Majid.

Many foreign policy experts believe that Saddam decided to invade Kuwait thinking he had a tacit U.S. "yellow light" from his conversations with the U.S. ambassador April Glaspie. In reality, he had received no such message; his lack of understanding of America and his poor English skills caused him to totally misread her and what she had told him.

President George H. W. Bush immediately demanded a full and unconditional Iraqi withdrawal. The administration began building a North Atlantic Treaty Organization-based military and diplomatic alliance designed to achieve an Iraqi withdrawal, and it began building up U.S. forces in the region. On November 29, the UN Security Council passed a resolution giving Iraq until January 15 to complete its withdrawal from Kuwait, and it authorized member states to take whatever action would be required to ensure Iraqi compliance.

On January 17, the U.S.-led coalition opened an air campaign against Iraq, targeting and neutralizing the country's air defense systems. Almost immediately, the allied air forces gained total air superiority and shortly afterward began a ground campaign. The Iraqi forces, outmanned, outgunned, and outgeneraled, began a retreat, which turned into a rout. By the end of February, Kuwait had been liberated, and the Iraqi forces had retreated toward Baghdad.

Iraq's Shiite and Kurdish communities, who had been oppressed and persecuted under Saddam's brutal regime, started up spontaneous and uncoordinated uprisings, hoping to overthrow the Iraqi dictator. They assumed that the United States would provide them with the assistance they required.

However, they soon realized that they had badly miscalculated. The Bush administration feared that Iraq's Shiites would ally themselves with Iran; it decided that Saddam represented the lesser of the evils and allowed him to use the remnant of his forces to crush the Shiite uprising.

The Kurds were luckier. Although not willing to risk the breakup of Iraq by allowing Kurdish independence, the United States decided to give the Kurds enough wiggle room to establish a *de facto* autonomous zone. The Peshmerga (Kurdish guerrilla army) was well trained (it had been trained and supported by Israel in the 1970s and 1980s), highly motivated, and familiar with Kurdistan's mountainous terrain; it was able to handle Iraqi ground forces as long as they lacked close air support. The United States obliged by getting northern Iraq declared a "no-fly zone," effectively keeping the Iraqi air force out of Kurdistan's skies. The war ended with Saddam strong enough to maintain his rule of Iraq but weakened enough to prevent him from posing any kind of threat to his neighbors.

President Bill Clinton continued to enforce the no-fly zone over northern and southern Iraq. American and British air forces engaged in a low-intensity air war against Saddam to enforce the no-fly zone. Sanctions against Iraq continued to be enforced by the United Nations, which limited revenue for the government and caused hardship for the civilian population, mitigated in part by the humanitarian "oil for food program." In retrospect, Saddam lacked the capability to build weapons of mass destruction after the Gulf War of 1991, but his failure to fully comply with UN Security Council Resolution 687, mandating disarmament, fueled suspicion, especially among neoconservatives within the United States. His regime would play what has been termed a "cat and mouse" game with the UN inspectors, sometimes granting access to facilities and individuals while at other times denying it.

The Iraq War of 2003 and Its Aftermath

In the public justification for waging a second war against Iraq, President George W. Bush claimed that the United States must prevent Iraq from acquiring weapons of mass destruction. Bush also argued that the United States was engaging in a war against Saddam Hussein's regime to spread democracy in the Middle East. By toppling Saddam's government and replacing it with a democratic regime,

the United States could promote democratization throughout the Middle East. In contrast to the 1990 Gulf War, the United States did not receive the backing of the UN Security Council, and a number of American allies refused to send troops, including Canada, France, and Germany. The United States, along with coalition forces, had little problem defeating the Iraqi military forces but struggled to effectively control even the capital of Baghdad after cessation of hostilities. Lawlessness, followed by a growing Sunni insurgency, damaged an already fragile economy and hindered the role of the United Nations and nongovernmental organizations in aiding the reconstruction. For instance, the United Nations was forced to withdraw from Iraq after a car bomb destroyed its headquarters in 2004, killing scores of officials. Paul Bremer, who governed Iraq during the American occupation, has been criticized for his aggressive policy of de-Baathification, especially his dissolution of the Iraqi army, which helped to further fuel an insurgency aimed at U.S. forces and allies within the country. Although the United States poured billions into Iraq for reconstruction, much of this money was lost through corruption, inflated charges by private contractors, and ill-conceived projects that were often destroyed by insurgents.

The United States did establish an interim government and returned sovereignty to Iraq in June 2004. In early 2005, Iraq held multiparty elections that highlighted the fractured religious and ethnic divisions within the country. The constitution promulgated by the new government proclaimed Iraq an Islamic republic that respected the religious freedom of other minority groups, including Christians. It also provided a significant degree of regional autonomy. Legislative power under the constitution rested with a Council of Representatives; yet to be implemented is an upper house, the Council of Federation. The president was made a largely symbolic head of state elected by the Council of Representatives. Executive power rested with a prime minister, who is also elected by the council.

Despite the lofty principles of the constitution, the security situation deteriorated dramatically in 2005 and 2006, with the Iraqi government unable to provide basic security to its population. The security situation in Iraq improved dramatically under the leadership of General David Petraeus, who took over as commanding general in Iraq in 2007. Not

only did the number of American forces increase but a new effort was made to protect civilian populations from insurgent attacks. This new military strategy was combined with sustained efforts to co-opt Iraqi Sunnis and split them from their erstwhile jihadist allies, eventually bringing the situation under some kind of control. However, by allying themselves with the Sunnis, the Americans basically eliminated whatever chance they may have had of achieving strategic cooperation with the Shiites. This empowered the Shiite parties, which preferred an alliance with Iran over one with the Americans, who were once again perceived as betrayers by the majority of Shiites. The result is a sectarian Shiite government allied with Iran.

The improved security arrangements helped revive a morbid Iraqi economy and allowed the gradual restoration of basic services such as electricity. Oil production levels soared and by 2011 surpassed the levels in the final years of the Saddam regime. Iraq has even attracted foreign investment from South Korea, China, and other countries. Improved revenues have freed the Iraqi government from dependence on American foreign aid.

During the U.S. presidential election of 2008, Barack Obama declared that he stood by his earlier opposition to the United States going to war against Iraq in 2003 and pledged to withdraw combat troops from this country. President Obama's plans to leave Iraq were welcomed by a Shiite-dominated government eager to see foreign forces leave the nation. The American forces ended their combat role in 2010 and focused on training Iraqi forces until the American forces totally withdrew at the end of 2011. Although the United States and Iraq have maintained relations under the Strategic Framework Agreement negotiated at the end of 2008—stating that the two nations will continue to maintain a mutually supportive bilateral relationship—the Shiite-dominated government has also sought to maintain good relations with neighboring Iran. Since the U.S. withdrawal, relations with the Sunni minority have been troublesome, to the point where Iraq appears on the verge of either breaking up or breaking into a civil war.

Iraqi Military Capabilities

The Iraqi military at this time is incapable of posing any kind of threat to its neighbors. Following the

2003 U.S. invasion, it has undergone a complete and total metamorphosis. The Saddam-era Iraqi military was predominantly Soviet supplied and trained. This military was disbanded by the U.S. occupation forces. To replace it, the United States began building from scratch a U.S.-trained and -equipped military force, conceived and designed primarily as a counterinsurgency force rather than a conventional military.

In recent months, this force has become increasingly sectarian, reflecting the growing sectarianism of Iraqi society as a whole. Sunni units, considered untrustworthy by the Shiite government of Prime Minister Nouri al-Maliki, have been increasingly sidelined. At the same time, there is growing evidence of the gradual inclusion of irregular Shiite forces loyal to Muqtada al-Sadr, the pro-Iranian Shiite leader, into the Iraqi military and security forces.

Officially, the Iraqi security forces (including the ground forces, air force, navy, police, and security forces) number approximately 250,000. However, these figures include the Sunni units, whose operational capabilities have been compromised by the government's policy of sidelining them.

These figures do not include the Shiite militias, which are increasingly cooperating with the government and are unofficially being inducted into the security forces to eventually replace the Sunni units, which will either be demobilized or defect if civil war erupts. The bottom line is that it is difficult to state with certainty the exact size of Iraqi military and security forces.

It is also unclear, given the increased tension between Baghdad and Washington, for how long the United States will continue to supply Iraq with military equipment. The most likely scenario is that all security cooperation between Iraq and the United States will eventually cease and that the Iraqi military will undergo a countermetamorphosis, reverting to being a mainly Russian- and Chinese-equipped and -trained military force.

Whatever the outcome, the increasingly sectarian (Shiite) Iraqi military is unlikely to be able to pose any kind of threat to any of its neighbors. Its focus will be civil unrest and possibly civil war; its most likely foes will be Sunni forces and those of any neighboring state that may decide to intervene if civil war should break out in Iraq.

IRAQ INSURGENCY (2003–2011)

In March 2003, the administration of President George W. Bush initiated a preventive war to destroy the Baath party regime of Saddam Hussein without first mobilizing the elements of U.S. national power required to conduct a long-term occupation of Iraq, provide physical security for its population, or rebuild its civil infrastructure. This entry discusses the prolonged insurgency that followed the destruction of the Baath regime, and the U.S. countereffort to reestablish security and create the preconditions for an eventual withdrawal.

Overview, 2003–2011

U.S. forces defeated Iraq's military between March 20 and April 9, 2003. However, coalition (United States and United Kingdom) forces were unable to preserve civil order or maintain essential public services during the subsequent wave of looting, sabotage, and intersectarian revenge killing. The initial plans for a quick handover of sovereignty to a government of returned Iraqi expatriates gave way to an extended occupation authorized by the United Nations, which, in terms of international law, made the coalition responsible for the well-being of the occupied population. However, the coalition failed to normalize electrical, water, or sewage services due to a chronic insufficiency of uniformed civil affairs and engineer personnel in the theater and an extremely slow deployment of nonmilitary reconstruction assets. Insufficient troops, headquarters discontinuities, and staff personnel turbulence also prevented the coalition's separate civil and military

chains of command from effectively cooperating to disarm the sectarian Sunni and Shiite militias that formed after the Baathist collapse.

By mid-2004, two parallel insurgencies had emerged, both of which employed mortar and rocket fire, direct fire ambushes, and improvised explosive devices (IEDs) to impede coalition access to local Iraqi communities. The first was an alliance of convenience between former Baathists and Sunni religious extremists intent on preserving their prewar dominance in postwar Iraq. The second was a Shiite militia, Jaish al-Mahdi, loyal to Muqtada al-Sadr, who sought to drive the coalition out of Iraq and assume control of the state on behalf of the historically oppressed Shiite majority. Sunni-Shiite violence accelerated after the destruction of the al-Askari mosque, Shiite Islam's most venerated shrine, in February 2006. In the context of this escalating, triangular struggle, the U.S. military began to shift from "kinetic" missions designed to kill insurgents mounted from large, forward-operating bases to counterinsurgency (COIN) operations aimed at achieving increased population security in critical neighborhoods via smaller combat outposts from which troops patrolled on foot. As brigade and battalion commanders groped their way empirically toward classic COIN techniques, they were assisted by a group of active and retired general officers in the United States, who pushed for an increased COIN emphasis *and* a large, short-term increase in U.S. troop levels to reduce sectarian violence in central Iraq. Concurrently, key Sunni and Shiite leaders decided to cease resistance to and/or cooperate with the occupation, provided their own communities were shielded from ethnic cleansing. This process culminated in the "surge" of 2007–2008, during which the number of combat brigades in Iraq rose from 15 to 20. This increase, dispersed in combat outposts throughout Greater Baghdad, was better able to collect the intelligence necessary to neutralize the death squads and IED cells.

Both coalition and Iraqi deaths dropped significantly from mid-2007. This reduction in violence established a delicate equilibrium between Shiite, Sunni, and Kurdish political leaders and their associated militias, which allowed them to pursue their opposing political goals through parliamentary procedural maneuvers rather than armed force. In turn, this permitted the incoming administration of President Barak Obama to draw down U.S. combat

forces throughout 2009 and 2010 while initiating a limited surge in Afghanistan's Operation Enduring Freedom, largely patterned on the Iraqi experience. Operation Iraqi Freedom formally ended on August 31, 2010. The subsequent U.S. "advise and support" mission in Iraq, Operation New Dawn, was terminated unexpectedly early when the Iraqi parliament refused to negotiate a status of forces agreement that would have sheltered U.S. military personnel from prosecution in Iraqi courts for violations of Iraqi law. The last American occupation personnel exited Iraq on December 18, 2011.

Coalition Loss of Initiative and the Emergence of a Dual Insurgency, 2004–2006

The war aim the Bush administration hoped to achieve through Operation Cobra II, the invasion of Iraq, was usually defined in terms of the following "end state": a democratic and stable Iraq with a market economy, able to control its borders, at peace with its neighbors, and an ally of the United States in the Global War on Terrorism. In effect, this required the United States to transform Iraq into a Western-style liberal democracy immediately after destroying its full range of existing governing institutions. The initial failure to achieve any element of this end state between 2003 and 2006 was due to five primary causes: (1) profound American ignorance of the nature of Iraqi society and the probable actions of the major political constituencies in Iraq after the destruction of Baathism; (2) the structural and doctrinal inability of the U.S. military and diplomatic establishments, in 2003, to rebuild Iraq along the lines required by the end state; (3) the military and civil-military decisions taken by officials of the Department of Defense under Donald Rumsfeld intended to accomplish "regime change" in Iraq with a *minimal* commitment of resources, in the pursuit of the "transformation" of the U.S. military away from a reliance on heavy, mechanized forces; (4) the failure of the commander of U.S. Central Command, General Tommy Franks, to insist on political guidance sufficient to plan for Iraq's "postconflict phase"; and (5) the initial decision of the Coalition Provisional Authority (CPA), under L. Paul Bremer, to "de-Baathify" Iraq, which triggered an immediate armed Sunni resistance to the U.S. occupation.

The neoconservative think tank figures who assumed key roles in the Department of Defense

during the Bush administration believed that the collapse of the Soviet Union eliminated the last coherent ideological opposition to the classical liberal principles of representational politics, a market economy, and the smallest possible central state. Furthermore, they believed that the United States had both a right and a duty to sponsor the expansion of these “values” globally, by armed force if necessary, even if doing so would violate existing tenets of international law based on the autonomous sovereign nation-state. The neoconservatives assumed that all peoples, globally, want what Americans “naturally” want, irrespective of all other national histories and cultural traditions. These officials, thus, never critically examined what to them was a self-evident truth that the Iraqi people would welcome the coalition forces as “liberators” and that they would wait patiently for their liberalization.

Bush administration officials also failed to closely study the domestic impact within Iraq of the 40 years of one-party Baath rule and the UN sanctions imposed after the Persian Gulf War. Stated simply, an enormous distance existed between the Iraqi state and Iraqi society. The state in Iraq had never appeared to the Iraqi people as a neutral arbiter between social classes and ethnic/sectarian communities, allocating resources through representative institutions and resolving disputes through the rule of law. Instead, it represented a set of coercive institutions used to enforce the dominance of one community over all the others, while simultaneously serving as an upward-mobility corridor for ambitious individuals through Baath party membership. Iraqis excluded from direct access to the state were forced to seek support from local tribal or ethnic authorities approved by the Baath party but who lacked communal legitimacy. When the Baath regime collapsed, and the coalition appeared unable to provide essential services, Iraqis refused to rally around the coalition-approved expatriate politicians installed in Baghdad’s Green Zone. Instead, they armed themselves, tried to secure their neighborhoods, and gravitated toward authentic sectarian leaders who had remained within Iraq and survived Baathist repression, such as Grand Ayatollah Ali al-Sistani and Muqtada al-Sadr, who opposed the occupation. Thus, there was in 2003–2004 no single set of legitimate political actors in Iraq who could both interpret the actions of the coalition to the population and prepare to receive the reins of

civil power *from* the coalition, in pursuit of the U.S. end state.

The CPA, under Ambassador Bremer, was unable to act constructively in the initial stage of the occupation. In fact, it threw gasoline onto the fire with its first two acts: CPA Order Number 1, for the “De-Baathification of Iraqi Society,” May 16, 2003, and Order Number 2, for the “Dissolution of Entities,” May 23, 2003. As originally promulgated and understood by the Iraqi people, these discharged the entire Iraqi army, even those units that negotiated surrenders with the advancing coalition units, including the Sunni-dominated officer corps. Deprived of both the income and the status of their positions, numerous former officers, with knowledge of both the Baathist intelligence network and the locations of numerous munition dumps throughout Iraq, immediately organized the first insurgent cells in the Sunni-majority cities north and west of Baghdad. CPA Order Number 1 also had the effect of excluding more than 30,000 middle- and upper-level technocrats who had held rank in the top four levels of the Baath party from public sector employment in all national ministries (Oil, Electricity, Health, Education, etc.). This doomed the coalition’s civil reconstruction effort to years of paralysis: Insufficient numbers of Iraqis remained in place to centrally operate the electrical grids and the water purification and sewage plants necessary to stabilize everyday life. Tribal networks and sectarian militias stepped into the gap by providing water, electricity, and medical care, with profits from the sales of generators, fuel, and cooking oils often funding insurgent activities. This fragmentation and regionalization of civil society further impeded the development of a unified Iraqi national identity.

The first year of the occupation also revealed that neither the U.S. State Department nor the defense establishment were organized, resourced, or trained to reconstruct the Republic of Iraq. In fact, the concept of “nation-building” had long been ridiculed by neoconservative thinkers. Even after seeking and receiving responsibility for the “postconflict mission” in Iraq, Secretary of Defense Rumsfeld was concerned, above *all* other considerations, to conduct the invasion with an absolute minimum of heavy-maneuver forces and withdraw them from Iraq as soon as possible. While nothing could have entirely prepared U.S. commanders for the chaos of April–May 2003, the troop basis

for the invasion was critically short of the military police, civil affairs, and engineer units necessary to limit the destruction of essential civil infrastructure, even though those units existed in the United States and were doctrinally better prepared for “stability” operations than combat arms units. Within a month of the fall of Baghdad, Rumsfeld ordered the U.S. Army’s 3rd Infantry Division (Mechanized) and 1st Marine Division to prepare for redeployment *from* Iraq to the United States and canceled the follow-on deployment of the 1st Cavalry Division *to* Iraq. In addition, he permitted (or ordered, it is not clear which) General Franks to redeploy the headquarters that had overseen the invasion, Central Command’s Combined Forces Land Component Command, from Iraq to Kuwait and to replace it in Iraq with a much smaller and less capable headquarters element, V Corps, which had commanded the army’s mechanized task forces during the “run” to Baghdad. This had the effect of removing from day-to-day operations in Iraq all the senior staff officers in Combined Forces Land Component Command who had extensive knowledge of Iraqi society and politics. V Corps was subsequently redesignated as Combined Joint Task Force Seven, but it remained undermanned until the spring of 2004, while the dual Sunni and Shiite insurgencies metastasized throughout central and southern Iraq.

In addition to the insufficient troop basis for the enforcement of civil order in Iraq and inadequate command and control, doctrinal confusion bedeviled the U.S. military during the first year of the insurgency. In 2003, the army identified four phases to a ground campaign: Phase I, Deter/Engage, in which the battlefield is “shaped” preparatory to the beginning of combat operations; Phase II, Seize the Initiative; Phase III, Decisive Operations; and Phase IV, Transition. While U.S. commanders understood that they could be required to conduct “full-spectrum” operations ranging from high-intensity maneuver warfare to “postconflict” stability and support tasks, most viewed these as operating *sequentially*, with a single point in time marking a *permanent* transition from Phase III to Phase IV. However, what emerged in Iraq was a requirement for battalions to conduct *simultaneous* full-spectrum missions *back and forth along the spectrum*, with troop units in adjacent districts facing completely different combinations of lethal threats and fleeing,

short-term opportunities for the co-optation of local elites. During 2004–2005, some commanders believed that they were in the last days of Phase III, opposing “diehard Baathist elements,” which encouraged them to mount large-scale sweep operations that disrupted the lives of nonresisting Iraqis. Only gradually did the U.S. forces realize that the coalition was facing a *mosaic* of local insurgent elements that did not trunk up into a single-directing leadership, as was the case in Malaya, Algeria, and Vietnam. Thus, they were not in *any* of the four phases of a conventional maneuver campaign. Nor were they confronting a Maoist-style protracted war. Instead, they faced a decentralized insurgency whose essentially local character was both its key strength during its expansion in 2004–2005 and, after 2006, its key weakness once the coalition commanders became skilled at driving carrot-and-stick wedges between its different, mutually hostile elements.

During 2004 and 2005, U.S. divisional commanders launched numerous large clearance operations to pacify urban areas in central Iraq, viewed as under the effective control of forces implacably opposed to the coalition. In June 2003, the 4th Infantry Division (Mechanized) conducted Operation Peninsula Strike in Diyala and Salah ad Din Provinces in the “Sunni Triangle” north of Baghdad, and 1 month later, the 1st Marine Expeditionary Force lunged into Fallujah in Operation Vigilant Resolve after the grisly killing of U.S. civilian security contractors. Operation Peninsula Strike served primarily to detain a large number of insurgent suspects of minimal intelligence value, which began the cycle of overcrowding in coalition detention facilities that contributed to the Abu Ghraib scandal, while Operation Vigilant Resolve was terminated short of its objective when the marines’ use of artillery and AC-130 gunship fires inside Fallujah generated negative press coverage throughout the Middle East. Also in April–May 2004, the 1st Armored Division and 2nd Armored Cavalry Regiment mounted what their commanders termed an “extension campaign” in the Sadrist-stronghold cities of An Najaf, Kufa, and Karbala and the Sadr City neighborhood of eastern Baghdad. These operations temporarily neutralized the Jaish al Mahdi militia forces in those cities. In October 2004, the 1st Infantry temporarily cleared the Sunni stronghold of Samarra, and in November, a combined marine-army task force returned to Fallujah

in Operation Al Fajr, clearing the city of insurgents and conducting a transition to units of the reconstituted Iraqi army, for the “holding” task central to classic COIN theory. However, the modest military success during Al Fajr was counterbalanced by the far more important negative political impact: The pacification of Fallujah universalized Sunni opposition to the coalition, causing a Sunni boycott of the nationwide January 2005 elections for seats in the Iraqi Transitional Assembly. This created a self-fulfilling cycle of Sunni alienation from what subsequently emerged as a Shiite/Kurd-dominated interim national government. Sunni leaders north of Baghdad and in Anbar province permitted al Qaeda cells to plant IEDs along coalition logistical routes and conduct attacks on Shiite populations in ethnically mixed neighborhoods. This caused the penetration of the Iraqi National Police by radical Shiite elements, who formed nocturnal death squads to counter-ethnic-cleanse Sunnis from majority Shiite communities. This cycle of violence and counter-violence continued to escalate throughout 2006, a year that also saw the introduction of a new and terrifying type of IED: the explosively formed penetrator. The explosively formed penetrator, set up in arrays of three to five, angled to strike the crew compartment of a five-man Humvee throughout that vehicle’s speed range, used a hypervelocity jet of molten copper capable of penetrating the armor of all U.S. fighting vehicles deployed to Iraq, causing horrific injuries to crew members who were not killed outright.

Throughout 2006, as the casualties increased and a creeping sense of tactical frustration mounted among U.S. combat leaders in Iraq, a gradual consensus emerged on the lessons to be learned from the anti-insurgent operations up to that point. To a remarkable extent, the doctrine promulgated in Field Manual 3-24, *Counterinsurgency*, December 2006, moved *up from* the field, as opposed to hierarchically down from Fort Leavenworth’s “schoolhouse,” as in all previous paradigm shifts. Reduced to a single phrase, the fundamental lesson was the centrality of population security: the absolute imperative to make the lives of ordinary Iraqis safer *immediately*, by constructing barriers between hostile or contested communities, creating and arming neighborhood self-protection groups, dispersing U.S. troops into a larger number of smaller garrisons,

and requiring those soldiers to patrol on foot rather than in vehicles.

The Coalition Regains the Initiative, 2007–2008

The American public correctly associates the turnaround in U.S. fortunes in Iraq with the surge of 2007–2008. The surge depended on six mutually supporting factors: (1) the reorientation of the U.S. Army and Marine Corps leadership within Iraq toward a COIN posture; (2) the Bush administration’s decision to temporarily increase troop levels to improve security in Baghdad; (3) the Shiite cleric Muqtada al-Sadr’s decision, in August 2007, to cease violent resistance to the occupation; (4) the Sunni Arab “Anbar Awakening,” which neutralized al Qaeda in Iraq; (5) the decision of authorities in Syria, Saudi Arabia, and Iran to reduce the flow of “foreign fighters” into Iraq and, in the case of Iran, to reduce its support of client militias within Iraq; and, finally, (6) the cumulative decisions of thousands of Iraqi security force members to begin serving the Republic of Iraq despite the appalling risks and to operate as national, not sectarian actors. Only the first two of these factors were under the direct control of the coalition, and it should be understood that the surge “worked” because virtually all forces in the region decided that it would be at least marginally in their interests that it should work, thereby creating the precondition for a U.S. drawdown.

The surge, which is discussed in depth elsewhere in this encyclopedia, can best be understood as a simultaneous increase in U.S. forces and a reposturing of those forces, in a campaign that foregrounded the basic principles of COIN within the combined U.S.-Iraqi military of 2007–2008. This campaign was effective enough, as evidenced by the reduced sectarian killings and attacks on U.S. forces, to induce other regional powers to abjure actions that would have further destabilized the U.S. pacification effort, while also convincing Iraqi officers in the army and National Police of the necessity to purge their ranks of sectarian actors and function more as a *national* security establishment. This gave Prime Minister Nouri al-Maliki the opportunity to launch a quixotic but unexpectedly successful Iraqi army effort to clear Basra of Sadrist militias in the spring

of 2008, just as the U.S. surge brigades were “turning the corner” in Baghdad.

The Drawdown, 2009–2011

The tendency of the dual Sunni and Shiite insurgencies during 2006 to devote more energy to sectarian violence than to attacks on coalition forces opened up a political window of opportunity that the United States was able to exploit with a new doctrine and a new theater leadership. However, this opportunity did not result from a formal revision of war aims by the president but rather from a process of self-criticism and reform within the military. In effect, the most socially unjust aspect of the war effort, the repeated deployments of volunteer army junior officers, noncommissioned officers, and enlisted men to Iraq, created a revision of war aims *from below*. Soldiers reflecting on their earlier experiences during the first and second tours understood that kinetic operations had minimal effects, while efforts, however awkwardly executed, to understand and meet the basic security needs of Iraqi citizens bore fruit in numerous incremental, local ways, which accreted during the surge to operational success. The original end state, a centralized and Westernized Iraq, in which all sectarian divisions were dissolved into a single national identity, gave way, during 2007–2008, to the creation of increased political stability through a reduction of public violence: the precondition for an orderly U.S. withdrawal. At the human level, U.S. soldiers and junior leaders went partially “native,” learning to negotiate within indigenous Iraqi structures of authority and social legitimacy. This allowed them to more effectively “partner” with Iraqi security forces to achieve clear-and-hold security in urban Iraq’s remaining multisectarian communities. However, all critical questions about the nature of Iraq’s future as a single, peaceful sovereign state remain undecided at the time of this writing.

Operation Iraqi Freedom came to an end on August 31, 2010, and was succeeded on September 1 of the same year by Operation New Dawn, which was intended to mark the point at which U.S. forces would operate exclusively in partnership with Iraqi units to further their professionalization and ability to plan and execute complex tactical missions.

Between March 19, 2003, and December 18, 2011, a total of 4,474 U.S. service personnel died while serving in Operations Iraqi Freedom and New Dawn.

Roughly 32,000 were wounded. A large proportion of those wounded were injured so severely that they will require technologically intensive medical care for the rest of their lives in their home communities. The monetary costs of the war while it was waged, which were typically quoted at \$2 billion to \$3 billion per week during 2007–2008, may have contributed to the collapse of the U.S. investment economy in 2008–2009 and certainly ended the dream of military transformation. Operationally a “near-run thing,” the Iraq War will probably be viewed in the future as a strategic failure partially redeemed by a synergistic alignment of highly contingent factors that could just as easily not have occurred.

IRAQ WAR (2003)

In the spring of 2003, the administration of President George W. Bush initiated a preventive war against the Republic of Iraq and the Baath party regime of Saddam Hussein. This entry discusses the causes, conduct, and immediate consequences of the initial conventional phase of the Iraq War. A separate entry discusses the Iraq insurgency of 2003–2011.

The ground-air campaign to defeat the Iraqi military required only 3 weeks. However, coalition (United States and United Kingdom) maneuver forces were unable to preserve civil order or reestablish essential public services after the collapse of the Baathist regime. Indigenous nationalist and sectarian forces subsequently mounted a protracted insurgency against the U.S. occupation. Three interrelated factors produced this outcome. First, the Bush administration and the U.S. defense establishment assumed that the U.S. occupation would not be resisted by the Iraqi people. Military staffs in particular believed that residual Iraqi security forces would be available and sufficient to maintain public order. Consequently, the Coalition Provisional Authority's first two acts were to dissolve the Iraqi army and bar all members of the Baath party's top four leadership levels from day-to-day administrative roles in Iraq's civil ministries. This shifted the burden of internal security, social services, and local governance onto commanders of troop units untrained for such duties. Second, the Defense Department and U.S. Central Command under General Tommy Franks failed to plan adequately for what are termed "stability operations" in army doctrine. Thus, neither military nor civilian assets were in place or in the deployment "pipeline" to restore the water, sanitation, electrical, and medical services that had been degraded by the post-1991 sanctions regime against Iraq and the 2003 air campaign. Finally, all aspects of the planning for Phases I through III of Operation Cobra II were infused with Secretary of Defense Donald Rumsfeld's fixed idea of transforming the post-Gulf War U.S. military into an "agile" force exploiting special operations, smart weapons, and "information dominance" to achieve quick-in, quick-out victories: the "Afghan Model" that neutralized (but did not destroy) the Taliban in 2001–2002. He accordingly reduced the number of heavy divisions executing Operation Cobra II to the absolute minimum consistent with operational success, without consideration for postconflict "nation-building." This meant that the United States would be held responsible by the Iraqi citizenry for not preventing a crippling outbreak of looting, infrastructure sabotage, and revenge killing. The interaction of these factors ensured that the virtuosic performance of the coalition military in the minimally resourced mechanized offensive would be irrelevant to the dual Sunni-Shiite insurgency that began to emerge

in the summer of 2003. The lack of U.S. government interagency planning also meant that the excellence of soldiers and commanders in joint maneuver warfare would be of minimal use in the initial effort to rebuild Iraq's civil infrastructure. Finally, it is difficult to assess the success or failure of the 2003 campaign at the strategic level of war, because the Bush administration advanced so many distinct, audience-specific justifications for the resort to war that it is unclear whether a single national war aim *past the initial destruction of the Baath regime* was ever identified. Thus, although the ground campaign was a stunning achievement at the tactical and operational levels of war, it did *not* achieve decisive strategic results because the struggle to stabilize postconflict Iraq degenerated quickly into a resisted occupation and a protracted counterinsurgency campaign.

Causes

In the aftermath of the Iranian Revolution of 1979, the single, irreducible goal of U.S. foreign policy in the Middle East was to prevent the emergence of a single regional power capable of disturbing the world's oil market or posing an existential threat to the State of Israel. In spite of his failures during the Iran-Iraq War of 1980–1988 and his ejection from Kuwait in 1990–1991, Saddam Hussein's Iraq seemed, throughout the 1990s, to be the most likely candidate to establish regional hegemony. His subsequent suppression of Shiite revolts in southern and central Iraq after hostilities ended in 1991, his use of chemical weapons on Kurdish communities in the north, and his continuation of an Arab nationalist, one-party tyranny ensured that he would be demonized during the presidential administrations of both Bill Clinton and George W. Bush. Meanwhile, several developments within the United States made a second war with Iraq more likely. The first of these was the dominance of neoconservatives within the Bush White House. Central to neoconservatism was a belief in the ability of a "muscular" foreign policy to expand liberal political and economic institutions and an emphasis on military "hard power" (rapid deployment of mechanized forces, very long-range bombers, naval cruise missiles, etc.) at the expense of the "soft power" institutions (diplomatic, economic, and cultural) that had reinforced the U.S. strategy to contain the Soviet Union's influence in the developing world between 1947 and 1989. During the 1990s,

numerous vocal defense intellectuals embraced the concept of militarized “regime change.” This blurred the critical distinction between a *preemptive* war to forestall an imminent attack of one sovereign state on another, permitted under international law (with a very high evidentiary bar), and a *preventive* war to remove a perceived potential threat. A preventive war is a form of aggression, and it was not surprising that China, Russia, Germany, and France refused to endorse the Bush administration’s unilateral military solution to the dilemma Iraq posed for the international community in the absence of clear proof that Saddam Hussein had retained his chemical warfare capabilities and/or was actually developing nuclear weapons. This evidence could not be supplied for the simple reason that no Iraqi mass effect weapons program in fact existed in 2003. Second, the terrorist attacks of September 11, 2001, created a popular atmosphere in which journalists and politicians were discouraged from questioning the administration’s manifest intent to visit regime change on Iraq. Other justifications mooted by Bush administration spokespersons in addition to the weapons threat included putative Iraqi linkages to and support for al Qaeda and Saddam Hussein’s ongoing repression of non-Sunni populations. Even the UN-imposed sanctions regime, which was causing extreme suffering for non-Baathist segments of the Iraqi population, was employed as a reason to attack Iraq: The sooner Saddam fell, the sooner the sanctions would be lifted. Finally, the war seemed eminently “doable”; the lethality and joint doctrinal sophistication of the U.S. military made an overland campaign to Baghdad appear to pose no more than minor administrative and logistical problems.

Numerous journalistic accounts place Vice President Richard Cheney at the center of an initial consensus in the post-9/11 Bush White House that regime change in Iraq would remove a grave impediment to stability in the Middle East by creating a liberal democratic state to counterbalance the influence of Syria and Iran. Milestones along the way to an American public embrace of this project included President Bush’s January 29, 2002, “Axis of Evil” address to Congress, which equated Iraq to Iran and North Korea; the congressional authorization of October 11, 2002, for the use of armed force against Iraq; and Secretary of State Colin Powell’s failed attempt to secure a similar UN authorization in February 2003. European skepticism triggered a

jingoistic spasm in the domestic electronic and print media that neutralized public opposition to a now overdetermined conflict.

Conduct

The initial planning for the invasion of Iraq envisioned two primary lines of operation: one north from Kuwait toward Basra and Baghdad and one south from eastern Turkey toward Baghdad through Iraqi Kurdistan. Special operations forces would enter western Iraq from Saudi Arabia to prevent rocket attacks on Saudi Arabia or Israel, while searching for the weapons of mass effect Iraq was believed to possess. However, the Turkish parliament denied ground transit rights through Turkey, which prevented the U.S. Army’s 4th Infantry Division (Mechanized) from participating in the initial invasion. Operations in northern Iraq were limited to the use of the 173rd Airborne Brigade, based in Vicenza, Italy, and special operations detachments to consolidate Kurdish Peshmerga control over Iraqi Kurdistan.

The southern offensive was prosecuted by two corps-level headquarters. The first of these was the U.S. Army’s V Corps, which contained the 3rd Infantry Division (Mechanized), the 101st Airborne Division (Air Assault), a brigade of the 82nd Airborne Division, and the 11th Attack Helicopter Regiment. The second was the U.S. Marine Corps’s 1st Marine Expeditionary Force, which contained the 1st Marine Division (MARDIV), the British 1st Armoured Division, and the two smaller marine expeditionary units that formed Task Force Tarawa. V Corps, rich in Abrams tank and Apache attack helicopter assets, would advance on the general axis As Samawah–An Najaf–Karbala–Baghdad. The 1st Marine Expeditionary Force was tasked to secure Basra and the port facilities at Umm Qasr using the British 1st Armoured, while advancing north with the 1st MARDIV and Task Force Tarawa on the general axis An Nasiriyah–Ad Diwaniyah–An Numaniyah–Baghdad.

The subordinate elements of V Corps and the 1st Marine Expeditionary Force advanced from the Kuwaiti border to the outskirts of Baghdad between March 20 and April 4, 2003, against resistance that was frequently courageous but lacked tactical coordination and indirect fire support. The armor-heavy units (3rd Infantry and 1st MARDIVs) maintained

their momentum and bypassed local centers of Iraqi army or irregular Baath party *fedayeen* resistance, while the lighter forces, including V Corps's air assault and airborne units and the marines' Task Force Tarawa, secured temporary logistical bases and kept ground lines of communication open to the Kuwaiti rear. A "tactical pause" during March 24–30 rested vehicle crews during an intense sand and rain storm, while providing an opportunity to resupply the temporarily halted forward units with food, fuel, and ammunition. The overall pace of the advance was so rapid that the few Iraqi command-and-control headquarters that actually functioned issued commands that were instantly "overtaken by events." However, the *fedayeen* were able to inflict several costly ambushes on marine units and army logistical convoys moving north, most notably the 507th Maintenance Company at An Nasiriyah on

March 23. Coalition air assets opened their campaign with an initial "shock and awe" attack on Baath party facilities in Baghdad on March 20, followed by close air support to the ground advance. Laser and other precision-guided munitions constituted 67% of all air-dropped ordnance during Cobra II.

After attacking across the Euphrates River at Karbala between April 1 and 3, the 3rd Infantry Division approached Baghdad on the west bank of the Tigris River, while marine units approached along the Tigris's east bank. Baghdad International Airport and the capital itself were secured between April 4 and 9, after the repulse of several *fedayeen* counterattacks against U.S. forces occupying Baghdad International Airport and several staging areas in the capital's western suburbs. Finally, two battalion task forces of the 3rd Infantry Division

Members of the guerrilla fighting group Fedayeen Saddam marching on March 5, 2003, in Baghdad, Iraq. They were dressed in shrouds, ready to die in battle.

Source: Photo by Mirrorpix/Getty Images.

executed “thunder run” raids into the Baath Regime District, which later became known as the International or Green Zone, while two regimental combat teams of the 1st MARDIV secured eastern Baghdad. This marked the defeat of the military forces of the sovereign state of Iraq and the beginning of a brief interregnum that would yield, by midsummer, to an insurgency against the coalition occupation.

In the south, Basra was cordoned off by the UK 1st Armoured Division. As a direct assault on the city would have resulted in unacceptable civilian casualties, British commanders waited until they had acquired precise intelligence from the city’s Shiite population on *fedayeen* strong points, which were later directly assaulted without close air support to further reduce collateral destruction. Coalition special operations forces were also able to secure Iraq’s southern oil fields with less demolition and environmental damage than had occurred during the Gulf War of 1990–1991.

Consequences

The operational objectives of Cobra II were achieved at a historically low cost in friendly troops: Coalition combat-related deaths between March 20 and May 5, 2003, totaled 171 (138 U.S. and 33 UK). However, the direct result of the destruction of the Baath Party governing structure in Iraq and the liquidation of the Iraqi army was not the establishment of a “bridgehead of democracy” in the Middle East but the insurgency, which did not finally abate until the troop surge of 2007–2008—after 4 years of agony for the Iraqi people and the families of U.S. service personnel killed and wounded. While it is too early to judge the war’s overall consequences, it would appear that Iraq has become a weak sovereign state that may not be able to control its borders and airspace for another generation, while Iranian influence within Iraq has been elevated through its support of a Shiite political renaissance. The United States spent in excess of \$50 billion to partially reconstruct Iraq’s civil infrastructure, but the demand for services remains far in excess of capacity. As domestic political considerations prevented an increase in the size of U.S. ground forces after 2003, the Iraqi surge could only be executed at the cost of underresourcing the Afghan War. The Taliban was thus able to reconstitute itself and metastasize into provinces

that had been thought largely pacified. Over all, the Iraq War of 2003 would seem to provide evidence of what the British general Sir Rupert Smith has theorized as the *inutility* of force in the 21st century: the increasing inability of sovereign nations to create desired political end states in the less developed world through the traditional mechanisms of state violence.

IRAQ WAR, PLANNING FOR

Planning for the invasion of Iraq in March 2003 and its aftermath involved senior policymakers in George W. Bush’s presidential administration, the Departments of Defense and State, and the armed forces, particularly the U.S. Army and the U.S. Central Command. Battlefield victory and the rapid ouster of Saddam Hussein’s regime drew praise for the invasion plans, but postwar planning has been criticized for its overly optimistic assumptions and its failure to incorporate expert insights from the State Department’s Future of Iraq (FoI) Project. This entry surveys the pre-invasion planning for the Iraq War and discusses reports by the Army War College’s Strategic Studies Institute and the FoI project on postwar planning.

Initial Planning for War

Contingency plans for war with Iraq and policy calling for Iraqi regime change predated both the September 11, 2001, attacks on the United States

and the Bush presidency, but after 9/11, planning for a war and for regime change proceeded apace. Saddam's refusal to comply with international weapons inspectors' demands suggested Iraq's potential capability to proliferate weapons of mass destruction (WMDs), perhaps to terrorists. By tying Iraq to the terror threat, neoconservative officials who had long advocated the removal of Saddam's Baathist regime seized on 9/11 as an opportunity to advance that agenda. Indeed, Deputy Secretary of Defense Paul Wolfowitz reportedly called for military action against Iraq just hours after the attacks.

In late November 2001, Bush directed Secretary of Defense Donald Rumsfeld to review the existing contingency plans for war with Iraq. Within days, Rumsfeld had begun a dialogue with U.S. Central Command commander General Tommy Franks about the then most current plan, Operation Plan (OPLAN) 1003. From late 2001 through much of 2002, a contentious bargaining process between civilian officials and military planners resulted in a compromise war plan later criticized for being thin on manpower and short on foresight about how to secure a post-Saddam Iraq.

From OPLAN to No Plan to Operation Iraqi Freedom

Last revised in 1998, OPLAN 1003 reflected conventional military wisdom about war in the Persian Gulf. Shaped by American military experience in Operations Desert Shield and Desert Storm, it was heavy on mechanized infantry, assault forces, and expeditionary marines and called for some 380,000 troops. Rumsfeld complained that the plan was cumbersome and outdated, and he instructed Franks to develop a new plan. An outspoken proponent of transformational warfare, Rumsfeld believed that advanced technologies should be leveraged to minimize "boots on the ground." Rumsfeld's emphasis on air power and precision bombing allowed him to demand corresponding reductions in the numbers of troops, vehicles, and ground equipment sent into combat. The Iraq invasion would be a showcase for Rumsfeld's vision for future military interventions: lighter, faster, and more nimble.

General Franks's initial viewpoint reflected conventional army wisdom that a heavy personnel "footprint" overwhelms the enemy and assists in creating a secure postwar environment. Franks's

early plans bore the hallmarks of the conventional wisdom; one such plan, "Generated Start," would require some 275,000 troops. Insisting on a much leaner deployment of perhaps 75,000, Rumsfeld demanded revisions and, at times, micromanaged Franks's war plans, reportedly even red-lining specific units. Over time and under pressure, Franks internalized the call for a lighter and faster approach. By striking fast and hard, argued Franks, U.S. forces would disrupt Iraqi capacity to respond and quickly achieve victory. Franks reminded his staff and the press that "speed kills" the enemy.

After 10 months of rejected war plans, revisions, and red-lining, a new war plan emerged: Hybrid 1003V OPLAN. Later renamed Operation Iraqi Freedom, it featured roughly 140,000 troops, nearly twice the number Rumsfeld wanted but far fewer than what some senior military officials thought necessary. For example, Army Chief of Staff Eric Shinseki testified before the Senate Armed Services Committee that several hundred thousand soldiers would probably be needed to secure a postinvasion Iraq—a statement that elicited dismissive reactions from civilian officials like Wolfowitz. Secretary of State Colin Powell had reservations but expressed them to Bush and Franks only privately; publically, Powell stood firmly with the administration as it planned for war.

Marshaling Support for an Invasion

As the military plans took shape, political and diplomatic plans also moved forward. Vice President Dick Cheney and national security adviser Condoleezza Rice in media appearances spoke about the "gathering" WMD threat and the possibility of preventive military action against Iraq. In August 2002, White House Chief of Staff Andrew H. Card Jr. convened the White House Iraq Group, a senior group including Rice, the communications strategist Karen Hughes, the senior political adviser Karl Rove, and I. Lewis "Scooter" Libby, Cheney's chief of staff, to develop the public relations campaign to precede the military campaign.

The White House Iraq Group prompted Powell to make the case for war at the United Nations using unconfirmed evidence of Iraqi WMD production, collated in part by the Central Intelligence Agency and the Pentagon-based Office of Special Plans. Britain's Prime Minister Tony Blair bolstered the case

for war by citing evidence of an Iraqi WMD program, but France and Germany opposed an invasion and the UN Security Council did not authorize the U.S. decision to invade Iraq. Nevertheless, the appeal to UN member states, allies, and the American public was an important element of prewar planning, designed to legitimize and attract support for the invasion.

Diplomatic appeals included negotiations for foreign military cooperation and support, including overflight rights, staging areas for U.S. troops, and assembly of coalition forces to supplement and confer broader legitimacy on the U.S. invasion force. International support was lukewarm; for example, the Multi-National Force–Iraq (emplaced in May 2004 to stabilize Iraq) would comprise some three dozen countries, but only three (the United Kingdom, Australia, and Poland) contributed troops to the invasion force. The North Atlantic Treaty Organization’s ally Turkey declined an American request to launch a northern ground offensive into Iraq from Turkish territory. Instead, ground campaigns had to come solely from the south; army forces west of the Euphrates River and Marine Expeditionary forces along the Tigris River to the east linked up south of Baghdad to destroy Saddam’s Republican Guard and, along with the “shock and awe” bombing campaign, the Iraqis’ will to fight.

Planning for Postwar Operations

Postinvasion plans for the stabilization and restructuring of Iraq were neglected. The administration’s focus on justifying and generating support for the war and the Pentagon’s focus on logistics, invasion plans, and the destruction of Saddam’s regime diverted needed attention from postwar planning. Phase IV “postconflict” operations turned out to be ironically mislabeled in a country that sank into bloody insurgency within months of the fall of Saddam’s regime.

Perhaps working from best-case-scenario assumptions encouraged by the charismatic Iraqi exile Ahmed Chalabi, upbeat neoconservative officials stressed reports of the Iraqis’ desire for liberation from a brutal, repressive regime. Planners assumed that Iraqi opposition groups would rally behind the American soldiers and that Iraqi soldiers would be co-opted and assigned garrison details—and that the State Department would help install a functioning

provisional government almost immediately on completion of hostilities. However, Rumsfeld maneuvered to wrest control of postconflict operations from the State Department, marginalizing its influence and magnifying the flaws in the postwar planning process.

Blame can be and has been apportioned to General Franks for inadequate postwar planning, but as an institution, the army was not blind to the challenges of Phase IV. One month before the invasion, the Army War College’s Strategic Studies Institute published an 84-page report on reconstructing a postconflict Iraq that anticipated a severe burden on military forces in civil and security affairs; it noted the problems likely to arise from the tribal, ethnic, and religious differences in Iraqi society and asserted that a fragmented population living with weak political institutions and old habits of violent rule would vastly complicate any occupation.

According to the report, a successful occupation would require careful interagency planning, large forces, and a nationally supported, multiyear commitment to nation-building—precisely the opposite of what senior political officials wanted to hear. The actual occupation suffered from a lack of interagency cooperation, exacerbated by turf battles between Defense and State; a deficit of forces capable of securing Baghdad, much less all of Iraq; and an administration that shunned nation-building and sought to transfer hastily the burden of creating a functioning state to the inexperienced and divided Iraqis.

Plans and Reality: From Liberators to Occupiers

The State Department’s contingency planning for stabilization and reconstruction of a post-Saddam Iraq had begun as early as October 2001 with the initiation of the FoI project. Reluctant to participate in postwar planning for fear of implying tacit support for war, diplomacy-minded officials at the Department of State nevertheless set about the task. Seventeen expert working groups addressed topics ranging from democracy and civil society to public health, education, the economy, the environment, and energy resources. Included among the experts were many Iraqi expatriates involved in the Iraqi National Congress and other exile groups. Exiled Iraqis largely agreed that any postwar occupation

should be brief, but they sharply disagreed on the shape of a post-Saddam Iraq—in part because some were jockeying for high-level government positions in a new regime.

Despite marked divisions among its participants, the FoI project accurately predicted many of Iraq's postwar problems in its 13-volume final report. State Department warnings to the U.S. Central Command in February 2003 that the existing plans and the military's reluctance to engage in postwar policing could undermine an initial military victory fell on deaf ears, and an unreceptive Office of the Secretary of Defense likely ignored the findings of the FoI project when designing and empowering the Coalition Provisional Authority (CPA).

The CPA's first two public orders illustrate the Pentagon's poor utilization of the FoI project findings. CPA Order 1, demanding the de-Baathification of Iraqi politics and society, was nominally consistent with the recommendations of the Democratic Principles working group; however, that group's caveat that dismissal of all administrators with Baathist ties would destabilize Iraq was overlooked by the CPA's blanket de-Baathification order. CPA Order 2 summarily disbanded and dismissed Iraq's armed forces, despite the recommendation a year earlier by the Defense Policy and Institutions Working Group that the army gradually be halved and transformed into a democracy-supporting institution. Together, the two CPA orders dismissed, idled, and disillusioned many thousands of government and military personnel, in turn providing both spark and fuel for the insurgency that began in the summer of 2003.

Conclusion

The insurgency triggered a massive, sustained counterinsurgency that kept American combat forces in Iraq for the duration of the Bush presidency and beyond, an outcome that the journalist Thomas Ricks has labeled a fiasco. The contribution of poor postwar planning to that outcome is highlighted by the U.S. Army itself in *On Point II*, the Army's official history of the first 18 months of its postinvasion operations. A peaceful, democratic Iraq might yet emerge as the concluding chapter of the Iraq War saga, but in March 2003, the plans' authors had only the barest sketch of how to realize that goal.

ISRAEL

Israel is a country of 7 million people in the eastern Mediterranean littoral. It is bounded by the Sinai desert on the south, the Jordan River valley on the east, and Lebanon on the north, although its exact borders have been the subject of both war and political negotiations. Since 1967, Israel has occupied the Gaza Strip, the West Bank, and the Golan Heights, which it conquered in the Six Day War. Nonstate entities exercise some level of control over the occupied territories— Hamas over the Gaza Strip and the Palestinian Authority over the West Bank—so the borders between Israel and these areas are not international in nature. In addition, Israel has extended administrative rule to the Golan Heights and has

annexed East Jerusalem, a move that few countries have recognized. This includes the United States, which maintains one consulate in West Jerusalem and another 5 minutes away in East Jerusalem. This entry examines the political, economic, and social systems of Israel and Israel's relationship with the United States.

Israel's capital is Jerusalem, although the United States and most other countries maintain embassies in the coastal city of Tel Aviv. Almost all Israeli government institutions are headquartered in Jerusalem,

including the Knesset, Israel's legislature. One notable exception is the Ministry of Defense, whose headquarters is in Tel Aviv.

Political, Economic, and Social Systems

Two themes have influenced Israel's political, economic, and social systems: security and identity. Security has shaped institutional development and is a perpetual part of Israeli discourse. For example, Israelis follow the news avidly; one explanation

ISRAEL AND BORDERING STATES

Map of Israel and the surrounding areas.

Source: CIA map, courtesy of University of Texas Libraries.

given for this phenomenon is that whereas people in other countries watch the news, Israelis live it. Identity has also been a factor in institutional development in Israel, as well as a source of tension. For example, Israel is both a Jewish state and a democracy. This has implications for Israel's non-Jewish citizens, who constitute about one fifth of the population.

Political System

Israel is a parliamentary democracy with a proportional representation voting system. Political parties are allocated seats in the 120-seat Knesset based on their proportion of the overall vote, with a 2% vote threshold. There are no voting districts, and the people vote for closed party lists as opposed to individual candidates.

The low vote threshold—typical thresholds range between 4% and 6%—gives smaller political parties in Israel a disproportionate influence in government. Since larger parties rarely win more than one fourth to one third of the seats, smaller parties can exact policy concessions from larger coalition partners. Historically, the two main parties have been the left-leaning Labor party and the more conservative Likud, although the late prime minister Ariel Sharon formed the centrist Kadima party in 2005, which led the governing coalition until 2009, when it passed into the opposition. Smaller parties like the religious conservative Shas party and the nationalist Yisrael Beiteinu party have also played important roles in recent Israeli governments.

Israel's political system and its security environment are tightly linked. Parochial interparty competition generally recedes in the face of armed conflict—during the intifada in the early 2000s, when the intensity of Palestinian suicide and rocket attacks reached its peak, there was considerable popular support for severe constraints on Palestinian movement in the occupied territories, targeted assassinations, home demolitions, and the construction of a controversial barrier separating the West Bank and Israel.

The disproportionate influence of smaller parties is ever present, sometimes in spite of the security situation. The settler movement, for example, which supports the creation and protection of living space for Israeli Jews in the occupied territories, enjoys continued influence in government despite the fact

that only about 300,000 Israelis live in the West Bank. In fact, Israeli government resources to support settlement in the occupied territories—mostly military protection and housing subsidies—have increased steadily since the 1970s. Israeli Jews living in the occupied territories have been the targets of terrorist attacks over the years, and the settlements themselves are one of the primary issues in Palestinian-Israeli negotiations.

Civil-military relations are emblematic of the security-politics nexus in Israel. All Jewish and Druze citizens are liable for military or national service for 2 to 4 years, depending on gender, marital status, military specialty, and rank. Israel's active military force numbers about 175,000, with about 500,000 in the reserve force. Most Israeli males are reservists into their 40s, participating in training every year. Israel usually spends about 7% of its gross domestic product on defense. With so many resources and people dedicated to the military, it is an important part of Israeli politics.

A distinguished military career is a boon to those with political aspirations. Israel's most revered leaders commanded in the Israel Defense Force (IDF) with distinction during wartime. David Ben Gurion, regarded as the father of Israel, unified the various Jewish militias into the IDF and led these forces during Israel's 1948–1949 War of Independence. Yitzhak Rabin, who was the IDF chief of staff during the Six Day War, was prime minister when Israel signed the Oslo Accords with the Palestine Liberation Organization (PLO) in the early 1990s. Ariel Sharon, who was prime minister during most of the second intifada in the early 2000s, led an armored breakthrough in the Sinai during the Six Day War and was lauded as a hero in the 1973 Yom Kippur War. The judgment of senior military leaders carries a great deal of weight in matters of security, and public friction between civilian and military leaders is rare. There is an uncommon level of civil-military comity in Israel, symptomatic of Israel's security environment.

Israel's political system is also closely connected to issues of identity. The 1950 Law of Return grants all Jews in the world the right to Israeli citizenship, and there has been substantial discussion since on to whom this applies. Furthermore, Israel is both a Jewish state and a democracy. Although non-Jewish citizens enjoy the full rights of citizenship, there are some benefits to being an Israeli Jewish

citizen. For example, non-Jewish school children are often disadvantaged by not being able to take as many courses of a foreign language as their Jewish counterparts, as Hebrew fluency is required and non-Jews typically do not learn Hebrew as a native tongue. With the exception of some religious Jews, all Israeli Jewish citizens are required to serve in the IDF, service that is optional for Arab Israelis but is often a career enhancer for those who do serve. Despite this, non-Jewish Israeli citizens enjoy more rights and privileges than co-ethnic communities in surrounding countries. While there is some tension between Israel as a Jewish state and Israel as a democracy, Israel remains a strong democracy in a region of nondemocracies.

Economic System

Israel's economy is characterized by both large, state-run companies and vibrant entrepreneurship, a phenomenon that also has links to security and identity. Israel is prosperous; it enjoys a per capita gross domestic product that is more than five times the regional average and is one of the world's leading producers of high-tech military hardware and software technology, especially in information security. At the same time, the Israeli economy is burdened by a large public sector and social programs such as the national health care system. Israel has few homeless people, but this puts a significant strain on the economy.

The large government influence in the economy has its roots in issues of security and identity. From the earliest days of statehood, the preparation for war made arms production, communications, and transportation very important for defense. Today, these sectors are dominated by state-run companies. Not only do they play an important role in mobilizing for and conducting war, but they also provide employment for many Israelis. The size of the public sector reflects Israel's Jewish identity as well. In the days of the *yishuv*—the Jewish community in Palestine before Israel was established—Jews often could not rely on non-Jews in times of need, so the community rallied to support all of its members. The collective farming and small-scale manufacturing that began during this time as *moshavim* and *kibbutzim* still go on today and typify this mentality of collective support.

The Israeli penchant for entrepreneurship also has links to security and identity. The shoestring

military of Israel's early days required a great deal of creativity and initiative from the young leaders. This was reinforced by Israel's success in the Six Day War. Israel was outnumbered and outgunned, but Israel's leaders took a gamble that paid off handsomely—Israel tripled the territory under its control. Israelis also pride themselves on being flexible decision makers, a mind-set that also hearkens back to the lean, trying years of the *yishuv*.

Social System

Security and identity also have an influence on Israel's social system. Israeli worldviews range from secular and liberal, on the one hand, to religious and conservative, on the other. The compulsory military or national service that Israel requires of its citizens has an important socializing effect on those who serve and an exclusionary effect on those who do not, such as ultraconservative Jews and some non-Jewish citizens. Serving does carry with it employment and other opportunities, but some of those who serve complain that they are bearing the burden of securing ultraconservative Jews, who do not serve.

Social identity is also tied to where and how Israelis live. Tel Aviv is more liberal and secular than Jerusalem, which is more religious and conservative; Tel Aviv's nightlife, for instance, is regarded as vibrant by comparison. Israelis in the settler movement are more religious than those who live inside Israel's 1967 borders. This is not true of all Israelis living in the West Bank, however—government housing subsidies in the occupied territories draw many secular Israeli Jews as well. In addition, Arab and Druze citizens tend to live in their own communities, many of which—like Nazareth—are in the northern Galilee region. While there are no legal barriers to intercommunal social interaction, most socializing and marriages do not cross communal lines.

Relationship With the United States

Without question, Israel enjoys a special relationship with the United States. Some Israelis jokingly call Israel America's 51st state. Israel is the largest recipient of U.S. aid, which amounts to nearly \$500 per year for every man, woman, and child in Israel. In addition to this official support, there is active fundraising for Israel and Israeli causes among interested communities in the United States, especially Jewish

and Evangelical Christian communities. There is also staunch political support for Israel in American domestic politics, to the extent that it is rare to hear American lawmakers express criticism of Israeli actions. The United States has on a number of occasions also used its UN Security Council veto to deflect or block international condemnation of Israel.

The American-Israeli relationship has not always been this close. American support for Israel was relatively limited before the Six Day War, although President Harry S. Truman did recognize the new State of Israel only a few minutes after it was established. The United States largely adhered to an international arms embargo on the combatants in the 1948–1949 War of Independence, even after the Soviet bloc violated this embargo in a 1955 Egyptian-Czechoslovak arms deal. It was not until 1963 that the United States sold Israel its first major American weapon system, the Hawk missile. The Six Day War energized American support for Israel, and since then American aid to Israel has increased steadily, as has America's propensity to support Israel politically in the international community. Israel, for its part, has effectively cultivated this support, often hosting key American leaders or facilitating their visits to Israel.

One result of this support has been the IDF's use of a number of American weapon systems. Israel's air force uses the F-15, F-16 fighters, and Cobra and Apache helicopters, and ground forces use modified versions of American small arms, though most are made in Israel. Israel has also deployed the Patriot antimissile system. A notable exception to Israel's use of American weapon systems is its main battle tank, the Merkava, which is of Israeli origin.

With the exception of manning Patriot missile batteries during the 1990–1991 Persian Gulf War, the United States has never maintained a significant combat presence in Israel, although many members of the U.S. military have served there in a diplomatic capacity. One notable mission of this sort is that of the U.S. security coordinator, who oversees the training of nonpolice Palestinian Authority security forces.

Recent History and Future Challenges

Israel's greatest security challenges since the end of the Cold War have involved the Palestinians and Iran. That said, relations with the Palestinians have also been characterized by occasional security

successes, such that there has been a fluctuation between strife and quiet with the Palestinians while there has also been a steadily increasing, and increasingly ominous, security challenge from Iran.

When the Cold War ended in 1989, the population of the occupied territories was 2 years into the intifada, a general uprising against the Israeli occupation. At the same time, the U.S. government entered into a dialogue with the PLO, which led, in 1991, to the Madrid Peace Conference, in the course of which Israeli and Palestinian negotiators met face to face for the first time. By 1993, Israel and the PLO had negotiated the first Oslo Accord, contributing to the dissipation of the intifada and ushering in a hopeful period of peacemaking between Israel and the Palestinians.

This security success was short-lived, unfortunately. After the signing of the first accord, the militant group Hamas began using suicide bombers with increasing frequency in terrorist attacks on Israeli civilians. In addition, after Prime Minister Yitzhak Rabin signed the second Oslo Accord with Yasir Arafat and the PLO in 1995, he was gunned down by a radical Orthodox Jewish Israeli. Shimon Peres, who succeeded Rabin as prime minister, tried to keep the peace process moving, but he was not able to withstand the electoral challenge of the opposition Likud party, especially in the face of Hamas suicide bombing campaigns.

From 1996 to 1999, Likud's Benjamin Netanyahu was prime minister. While Israel enjoyed a period of relative quiet, especially in the last 2 years of Netanyahu's tenure, Israel and the Palestinians did not conclude a final peace agreement to establish an independent Palestinian state and ensure Israel's security. After Labor leader Ehud Barak became prime minister, hopes were again high that the two sides would negotiate a final peace agreement. While Barak successfully withdrew the Israeli forces from southern Lebanon—they had been there since 1982—he was not able to conclude an agreement with the Palestinians at Camp David in the summer of 2000.

A second intifada erupted in the fall of 2000, this one much more violent and organized than the first. Despite the fact that Barak was closer to an agreement with the Palestinians at Taba in December 2000 than he had been at Camp David earlier that year, the opposition Likud party came to power in early 2001, installing Ariel Sharon as prime minister.

Palestinian militant groups stepped up their terrorist attacks, resulting in a much greater loss of life than in the mid-1990s. The period from 2000 to 2004 was the most challenging security episode of the post-Cold War era, but Israeli policies and Palestinian infighting eventually contributed to a diminution of the second intifada.

In early 2006, Sharon suffered an incapacitating stroke and was succeeded by Ehud Olmert, former mayor of Jerusalem. Olmert's tenure, which lasted until 2009, saw continued improvement in the security situation vis-à-vis the Palestinians, but it also saw Iran increase as a strategic threat. Evidence of this was demonstrated by the 2006 Second Lebanon War, in which Iranian-backed Hizbullah forces fought the IDF to a standstill, despite the

fact that Israel seriously degraded Hizbullah's missile forces and destroyed significant portions of southern Lebanon's infrastructure. In addition, Israel's December 2008 to January 2009 incursion into the Gaza Strip in Operation Cast Lead precipitated a drastic reduction in Palestinian rocket fire from the Gaza Strip. Iran, for its part, had for years funded and trained the militant groups Hamas and Hizbullah, but when Mahmoud Ahmadinejad was elected president in 2005, he ramped up anti-Israeli rhetoric. This, coupled with Iran's failure to verify the purpose of its nuclear program, has made Iran Israel's primary strategic challenge.

This security situation has remained largely unchanged—uncertainty on both the Palestinian and the Iranian fronts—during Benjamin Netanyahu's

Gaza Strip—January 6: This handout image provided by the Israel Defense Force shows Israeli troops carrying out ground maneuvers on January 6, 2009, in Gaza. The Israeli army announced that four of its soldiers were killed in two friendly fire incidents that day. Israel continues to intensify its wide-scale ground assault on the Gaza Strip in an effort to put an end to Hamas rocket attacks against the Jewish state.

second tenure as prime minister, from 2009 to the present, despite saber rattling over Iran's nuclear program in 2009 and 2010 and the resumption of direct peace negotiations with the Palestinians in September 2010. There is no consensus on how to proceed in this uncertain security environment, although current Israeli discourse suggests a guarded pragmatism for the future. Those who are more hawkish on security argue that Israel can keep the security situation in the occupied territories under control indefinitely, and they tend to be more willing to strike at Iran's nuclear program now, before Iran tests a nuclear device. Less hawkish views hold that a peaceful Palestinian state is a long-term strategic necessity and that any attack on Iranian nuclear facilities would not be as successful as those against Iraq (1981) and Syria (2007). In addition, Israel seems to have responded to American pressure not to launch an attack on Iran, and few observers are openly optimistic regarding negotiations with the Palestinians, as negotiations have broken off and resumed a number of times, both directly and indirectly, since 2010. This guarded pragmatism will likely lead Israel to maintain its strategic flexibility into the future, with Israel able to pursue either

peace or war with the Palestinians or Iran as the case may be.

JAPAN

Since the early 1950s, the U.S.-Japan alliance has been the cornerstone of security and peace in East Asia. Following the end of the Cold War, the U.S.-Japan security relationship has been experiencing significant transformations to adapt itself to changing security environments in this region and elsewhere. What follows is a discussion of the current state of the U.S.-Japan security alliance, as well as the process that has led to the ever-closer security relationship between the two in recent years.

Japan: Its Geography and Political, Economic, and Social Systems

Located in the most eastern part of the Far East, Japan, a nation of about 128 million people, consists of four major islands and approximately 3,000 smaller islands, making it an archipelago. Japan has an area of 145,882 square miles, making it slightly smaller than California. Tokyo, the capital city, has a population of 13.2 million, and it serves as the political and financial center of the country.

Japan is a constitutional monarchy with a bicameral parliamentary system. The House of Representatives (the lower house) and the House of Councilors (the upper house) constitute the two chambers (the National Diet). The post of prime minister is filled by the head of the party that has the largest number of seats in the lower house. In the

lower house elections held in December 2012, the Liberal Democratic Party (LDP) returned to power after the 3-year reign of the Democratic Party of Japan, the main opposition party.

Japan is a highly developed industrial, free-market economy. It is among the world's major economic powers, although it was surpassed by China in terms of gross national product, losing its place as the world's number two economy in 2010. Furthermore, the Great East Japan Earthquake and the ensuing Fukushima nuclear accident that took place in March 2011 are believed to have a significant negative impact on the present Japanese economy, although opinions have differed among economists about the severity of the impact.

Article 9, U.S.-Japan Security Treaty, and the Self-Defense Forces

After the end of World War II, the Allied Powers, led by the United States, occupied Japan between 1945 and 1952. The twin initial objectives of the occupation were to demilitarize and democratize Japan so that it would never again pose a threat to other nations. Nowhere did these goals more clearly manifest themselves than in Article 9 of the Japanese Constitution, which was essentially drafted by the American occupation authorities. Article 9 stipulates,

Aspiring sincerely to an international peace based on justice and order, the Japanese people forever renounce war as a sovereign right of the nation

and the threat or use of force as means of settling international disputes.

In order to accomplish the aim of the preceding paragraph, land, sea, and air forces, as well as other war potential, will never be maintained. The right of belligerency of the state will not be recognized.

Escalating Cold War tensions, however, prompted the United States to shift the goals of the occupation to reconstructing Japan as America's staunch ally. At the conclusion of the occupation in 1951, Japan signed the San Francisco Peace Treaty by which it was readmitted to the community of nations. Simultaneously, the United States and Japan concluded a security treaty to contain the Soviet threat. In 1960, the security treaty was renewed as the Treaty of Mutual Cooperation and Security between Japan and the United States. Under the treaty, Japan granted the United States the right to station U.S. armed forces in Japan to maintain international peace and security in the Far East and the security of Japan.

In the meantime, the rearmament of Japan proceeded with the encouragement of the U.S. government. First, in 1950, the Japanese government established a National Police Reserve, which was reconstituted in 1952 as the National Safety Forces. In the same year, the National Safety Agency was created. In 1954, the National Safety Forces became the Self-Defense Forces (hereafter the SDF) consisting of the Ground, Maritime, and Air Self-Defense Forces, and the National Safety Agency was renamed the Self-Defense Agency (in January 2007, it was upgraded to become the Ministry of Defense).

Today, the SDF constitutes well-funded, well-equipped armed forces. Under the Self-Defense Forces Law enacted in 1954, these land, sea, and air forces are used exclusively for defense-oriented purposes (thus the ban on sending SDF into overseas combat zones) and are subject to the command of the prime minister. For the past few decades, Japan has ranked within the top 10 nations in terms of its defense expenditures, even though its expenditures have almost always been kept within 1% of gross domestic product (in 2011, Japan came in sixth with \$59.3 billion, according to the Stockholm International Peace Research Institute). As of 2012, SDF personnel totaled approximately 225,000, with the Ground SDF numbering about 140,000, the Maritime SDF about 42,000, and the Air SDF about 43,000.

The Redefinition of U.S.-Japan Security Arrangements in the 1990s

The changing security environment since the early 1990s in the Far East and elsewhere has prompted the Japanese government to make important choices about how to use the SDF in times of international crisis.

The Persian Gulf War in 1991 served as a turning point. Even though Japan ended up contributing \$13 billion to the total cost (estimated \$60 billion) of the war, it was initially criticized by the U.S. government as "being too little, too late." Having been forced to realize that "checkbook diplomacy" was insufficient, the Japanese government moved to create a legal framework enabling SDF personnel to be deployed overseas. As a result, the National Diet passed the 1992 UN Peacekeeping Cooperation Law, which permits the SDF to participate in a variety of noncombat missions under UN command.

After the Persian Gulf War came a series of international crises in the Far East that induced both the Japanese and U.S. governments to reevaluate the nature of the U.S.-Japan security cooperation in times of contingencies. They included the North Korea Nuclear Crisis (1993–1994) triggered by North Korea's withdrawal from the Treaty on the Non-Proliferation of Nuclear Weapons, and the Taiwan Strait crisis, when China conducted missile exercises off its coast in March 1996. As a result of these events, the issue of how Japan should respond to "perilous situations in areas surrounding Japan" in the framework of the Japan-U.S. alliance became an urgent agenda item for both governments.

In response, the U.S. Department of Defense published in February 1995 the U.S. Security Strategy for the East Asia-Pacific Region, calling for the redefinition of the U.S.-Japan security alliance. In October 1995, the Japan Defense Agency issued a new National Defense Program Outline for the first time in 20 years. The document emphasized the need to make efforts to realize effective cooperation between the SDF and the U.S. forces stationed in Japan. After the Taiwan Strait crisis, President Bill Clinton and the LDP government under Prime Minister Ryutaro Hashimoto issued a U.S.-Japanese Declaration on Security. The statement emphasized close defense cooperation based on a combination of defense capabilities for the SDF and the Japan-U.S. security arrangements. In this document, the geographical area of U.S.-Japan defense cooperation

was extended beyond the Far East to include the Asia-Pacific region. Furthermore, after a yearlong review of the 1978 Guidelines for U.S.-Japan Defense Cooperation, a new set of guidelines was announced by the U.S.-Japan Security Consultative Committee (SCC, composed of the U.S. secretary of state and secretary of defense and the Japanese minister of foreign affairs and minister of defense) in September 1997. It elaborated on various types of security cooperation between the two countries. Regarding “situations in areas surrounding Japan,” the new guidelines state that the concept is not “geographic” but “situational.” Subsequently, the Japanese government enacted in May 1999 the law concerning Measures to Ensure the Peace and Security of Japan in Situations in Areas Surrounding Japan.

9/11 Terrorist Attacks and Thereafter

The Japanese government’s response to the attacks of September 11 was very prompt. The LDP government under Prime Minister Junichiro Koizumi promised the U.S. government various types of support for the U.S. armed forces. To implement this, the Japanese government quickly enacted the Antiterrorism Special Measures Law, enabling the Maritime SDF to engage in refueling activities in the Indian Ocean during the U.S. attacks on Afghanistan. Furthermore, after the outbreak of the Iraq War, the Koizumi administration legislated in July 2003 the Special Law on Humanitarian Relief and Iraqi Reconstruction. This law authorized the deployment of Japanese troops for reconstruction aid in Iraq, resulting in the dispatch, in February 2004, of about 600 personnel of the Ground SDF troops on a reconstruction mission to southern Iraq.

Availing itself of the gathered momentum, the Koizumi government proposed in 2003 a series of bills related to crisis management, including Armed Attack Situation Response Law. Collectively, the legislation passed by the Diet has strengthened the hand of the cabinet in the event of an armed attack on Japan, while establishing a legal framework for the SDF to work with the U.S. forces stationed in Japan in any contingency. Subsequently, in December 2004, a new National Defense Policy Outline was issued. The document identified international peace-keeping activities and counterterrorism as primary components of Japan’s national defense strategy. It also emphasized the creation of a “multifunctional

military capability” to deal with new threats, including ballistic missile attacks.

In the meantime, a high-level security dialogue between the U.S. and Japanese governments was continuously being carried out. In particular, a series of SCC meetings conducted in 2005 and 2006 led to important agreements concerning U.S.-Japan security arrangements. In this regard, the United States-Japan Roadmap for Realignment Implementation announced by the SCC in 2006 is of particular importance. The agreements reached by the U.S. and Japanese governments in the realignment plan include the relocation of U.S. marines from Okinawa to Guam as part of the overall realignment of U.S. forces in Japan, the replacement of Futenma Marine Corps Air Station in Okinawa, and the deployment of a new X-Band radar system in Japan as part of the ballistic missile defense cooperation. These agreements are intended as strategic measures to strengthen the alliance.

U.S. Forces in Japan

U.S. forces in Japan are part of U.S. Pacific Command. There are approximately 80 U.S. military installations, including major military bases throughout Japan, with a total area of about 3.1 million square meters. They are concentrated in a few prefectures, including Okinawa and Tokyo. As of 2012, there are about 38,000 military personnel stationed in Japan. Annually, Japan has contributed a large sum of money as host nation support for the U.S. forces, shouldering about 75% of the cost of maintaining U.S. forces in Japan.

In particular, Okinawa Prefecture (located several hundred miles away from the mainland) currently hosts about 65% of the entire U.S. forces in Japan. U.S. military installations occupy about 20% of Okinawa Island. To alleviate the burden of the U.S. military presence on the local people, the U.S. and Japanese governments set up in 1996 a Special Action Committee on Okinawa (SACO), whose report called for the reduction and relocation of U.S. military installations in Okinawa, provided that alternative facilities were arranged. Furthermore, according to the 2006 realignment plan, the relocation of the Futenma Air Station would be completed by the end of 2014.

However, as of early 2013, the implementation of the SACO agreements and the realignment

plan has been very slow. The most conspicuous failure of implementation is the relocation of the Futenma Marine Corps Air Station to a new facility in Henoko, Nago city, in Okinawa. While the Japanese government has had a hard time reconciling the demands of the local residents who had opposed the original relocation plan with those of U.S. forces and while the local residents in the Henoko district have voiced their concern that the relocation plan would bring about environmental degradation as well as noise and occasional violence by U.S. troops, U.S. officials involved in the negotiation were reported to have been frustrated about the lack of progress in this matter. The scheduled relocation of U.S. military installations elsewhere in Japan also met with local resistance.

Having come to this impasse, the United States and Japan reached a new agreement in February 2012 to transfer 4,700 marines stationed in Okinawa to Guam by separating this transfer from the issue of relocating the Futenma Marine Corps Air Station, even though the 2006 realignment plan called for carrying out the transfer and relocation in an integrated manner. In any event, the issue of how to distribute the burden of U.S. bases and forces in the face of local opposition will likely continue to pose a worrying problem for both governments.

Conclusion

Since the early 1990s, the U.S.-Japan security alliance has undergone significant changes. Both conceptually and geographically, the *raison d'être* of the alliance is no longer geared to the Far East but has moved beyond its confines to include much wider areas. Overall, the U.S.-Japan defense cooperation has made great strides by sharing common strategic objectives in accordance with the changes in the post-Cold War security environment that helped restore considerable momentum to the U.S.-Japan alliance.

There are, however, several prominent legal and societal challenges to improving U.S.-Japan defense cooperation. First, there is the sensitive issue of collective defense—the right to take military action in response to aggression against Japanese allies. The official interpretation of the right to collective defense by successive Japanese governments is that Japan has the right of collective defense but exercising the right is unconstitutional because it exceeds the use of force permitted under Article 9, which

allows only the individual right of self-defense. This constitutional interpretation has placed severe restrictions on the activities of the SDF overseas. Some even argue that SDF participation in noncombat roles overseas, including rear-area support for U.S. forces outside Japanese territory, is an exercise of the right to collective defense in violation of Article 9. Not surprisingly, U.S. officials have occasionally criticized this strict legal interpretation of Article 9, hinting at the need for Japan to change it.

The Democratic Party of Japan government under Prime Minister Yukio Hatoyama (2009–2010) reportedly leaned toward a position in foreign policy that was more independent from the United States, yet diplomatic cables obtained by WikiLeaks revealed that the Hatoyama government spoke with a double tongue: While showing a conciliatory attitude toward the wishes of the residents of Okinawa—by promising that the Futenma Air Station would be relocated outside of Okinawa prefecture (thus easing the burden of Okinawa Prefecture's hosting of U.S. bases)—it simultaneously expressed to the U.S. government its willingness to comply with the bilateral agreements reached in the 2006 realignment plan. The successive governments led by the prime ministers of the Democratic Party of Japan have made little progress on the relocation of the Futenma Marine Corps Air Station.

However, the LDP government of Prime Minister Shinzo Abe (inaugurated in December 2012) quickly returned to the traditional policy of strengthening the U.S.-Japan security alliance, showing its readiness to relocate the Futenma Air Station to the Henoko district as stipulated in the 2006 agreement. Furthermore, Prime Minister Abe and U.S. Ambassador John Roos jointly announced in April 2013 that U.S. military facilities and land south of Kadena Air Base (the hub of U.S. air power in the Asia-Pacific), including the Futenma Air Station, would be returned to Japan in “fiscal 2022 or later.” This plan will reportedly be made possible on condition that the air station is relocated to the Henoko district in Okinawa prefecture.

Meanwhile, pacifism remains strong among the Japanese public. A significant portion of the general public believe that Japan, as the only nation that has suffered nuclear attacks, should preserve Article 9 at all costs, to serve as a lodestar for the cause of the permanent peace of the world. One might argue that amending Article 9 is tantamount to changing the

national identity that Japan has cherished since the end of World War II.

One thing is certain. National debate will continue in the foreseeable future over whether Japan should further deepen defense cooperation with the United States by aligning itself more closely with the broader Pentagon strategy of maintaining a strong military presence of approximately 100,000 U.S. troops in the Asia-Pacific region or if it should choose to edge toward a more independent self-defense posture while adhering to the spirit of Article 9.

JOINT POW/MIA ACCOUNTING COMMAND

The Joint POW/MIA Accounting Command (JPAC) is a task force within the U.S. Department of Defense whose stated mission is "to achieve the fullest possible accounting of all Americans missing [or prisoners of war], as a result of the nation's past

conflicts" (Joint POW-MIA Accounting Command website: <http://www.jpac.pacom.mil/index.php?page=home&ind>). Their motto, "Until they are home," reflects the priority of this joint command, so named because it is always composed of two or more branches of the military. This entry describes the history, procedures, and structure of JPAC, and examines the importance placed on recovering the dead, for the U.S. military and civilians alike.

JPAC operates from the island of Oahu, Hawaii, but its roots grew out of the Vietnam War, when two U.S. Army mortuaries operated in South Vietnam. When the conflict ended, these mortuaries closed and consolidated their personnel and equipment and relocated to Thailand. There, the U.S. Army Central Identification Laboratory (CIL) was established in January 1973 with a mission to search for, recover, and identify those service men lost as a result of the Vietnam War. Then, in 1976, the facility in Thailand was deactivated and moved to its current location near Honolulu, where the laboratory was redesignated as the U.S. Army Central Identification Laboratory, Hawaii (USACILHI).

On October 1, 2003, CILHI, the largest forensic anthropology laboratory in the world, merged with the Joint Task Force-Full Accounting (known before 1992 as the Joint Casualty Resolution Center), to form the Joint POW/MIA Accounting Command (JPAC). In addition to its headquarters located at Hickam Air Force Base, JPAC maintains another local detachment in Hawaii and three adjunct facilities in Thailand, Vietnam, and Laos.

JPAC's operations are structured into four interrelated components, namely, analysis and investigation, recovery, identification, and closure. Historians and analysts conduct in-depth research from a variety of sources and archival data, which they later use to estimate the most likely location of an unaccounted-for individual. Often, negotiations with representatives of foreign governments may be required before investigative missions can proceed. Then, utilizing the intelligence gathered by the analysts, recovery teams travel throughout the world to locate and retrieve the missing from these predetermined sites.

Teams of approximately 10 to 15 people, under the leadership of an anthropologist, carry out the excavations, often with the assistance of hired local laborers who are brought in to assist with the digging, soil screening, and collecting of skeletal remains and

additional evidence. All remains and artifacts found on these missions are returned to Hawaii where they are analyzed by CIL using a range of techniques to establish identification of missing Americans.

Lab scientists and anthropologists work together during the identification procedure, using mtDNA testing and other supporting forms of data, including material evidence (e.g., personal effects), to determine positive identity. Each separate line of evidence must be analyzed and integrated with the historical evidence, a lengthy process that may add years to the full recovery and positive identification of missing service members. Once identification has been firmly established and verified by an external reviewer independent of JPAC, the next of kin are notified, and the final closure phase can begin.

Since the First World War, the act of risking one's own life to recover the dead has assumed increasingly sacred prominence for U.S. soldiers. The practice can be traced to the fall of 1918, when the secretary of war promised a home burial to all those killed while serving overseas in what was believed then to be the war to end all wars. This American democratic process, as instituted by the government, genuinely attempted to respond to the wishes of its citizens, but as the 20th century passed, soldiers dying a long way from their homeland became increasingly common. This distance may have fostered harmony among soldiers as collective kinships developed in the absence of home and family, but it also became more difficult for the state to justify these conflicts as worthy of American involvement and sacrifice. Thus, abstractions, such as the proliferation of democratic ideals abroad, were invoked to strengthen national unity and bolster the moral and ethical resolve of citizen soldiers to fight. Frequent reminders and adherence to the actions and rituals of past armies added credence to military doctrine and further reinforced a sense of continuity and shared purpose within the ranks. What began as an unwritten tenet with currency to reinforce the solidarity of armies, has become an extension of the fallen soldier myth—one that glorifies the sacrifice of the living for the dead.

Efforts to fulfill this lingering moral obligation to the dead and their families can have dire consequences such as those that occurred on April 7, 2001, when seven U.S. servicemen and nine Vietnamese died in a helicopter crash in Quang Binh province, Vietnam, during a site survey for a planned JPAC

mission. The American team included men from the Joint Task Force–Full Accounting and POW/MIA Affairs, based in Hawaii, who were intent on recovering the remains of American servicemen lost during the Vietnam War. The 2001 JPAC mission with its subsequent tragic loss of life epitomizes the warrior ethos rooted in antiquity but recently codified in the soldier's creed as "I will never leave a fallen comrade." The practice also raises consideration regarding the lengths to which the United States has traditionally gone to avoid burials in countries deemed unworthy.

JOMINI, ANTOINE-HENRI

Baron Antoine-Henri de Jomini (1779–1869) was a Swiss-born French and Russian officer who was considered one of the foremost students of Napoleonic warfare and an authority on military strategy. This entry discusses the life of Jomini and looks at his writings and principles for warfare.

Born in the town of Payerne, in the Vaud canton, on March 6, 1779, Jomini's formative years

were influenced by his prominent family. His father, Benjamin, served as a mayor and, later, on the Grand Council of the Helvetic Republic. Early in life, Jomini was encouraged by his family to pursue a career in business, having been enrolled in a private school at the age of 14 for that purpose. Within a few years, he was working at a banking house in Paris. Yet the young Jomini was entranced by the military, a profession that seemed stimulating and full of excitement. Accordingly, Jomini left his career as a banker to enroll in the army during the Swiss Revolution in 1798. Rising to the rank of captain, Jomini served as secretary to the Swiss minister of war. In 1802, when the war was over, he returned to Paris to work in the military equipment industry and to write his first book on military theory, *Treatise on Grand Military Operations* (1805). Marshal Michel Ney, one of Napoleon's top generals, read the book and subsidized its publication. Ney also presented Jomini a position as an aide-de-camp. Later that year, he was offered a commission as a colonel in the French army. In 1806, as Jomini continued to expound his findings on military theory, he served on Napoleon's staff, where he won the Cross of the Legion of Honour, before returning to serve as Ney's chief of staff. Shortly thereafter, Jomini received a promotion to brigadier general.

Despite Jomini's meteoric rise to prominence, personal frictions and disagreements with military and political leaders would hamper his career in the French army. In 1813, after returning to work with Ney, Jomini would be arrested and censored for failing to supply specific staff reports that had been requested. His arrest and sudden disfavor prompted Jomini to leave the French army and join the Russian army as a military adviser to Tsar Alexander I for the next 2 years. In 1815, Jomini returned to Paris with the victorious allied army only to receive their disfavor for attempting to defend his old mentor, Ney, prior to his execution. Similar to his service with the French, Jomini was distrusted by the Russians for his prior affiliations. Nevertheless, he participated in the Congresses of Vienna (1814–1815), Aix-la-Chapelle (1818), and Verona (1822) before he returned to Russia to pursue his military career, receiving a promotion to full general in the Russian army. In the 1820s, Jomini served Russia in the realm of military education, helping found the General Staff Academy at St. Petersburg. His last active field service was in the Russo-Turkish War of 1828 where he received the Grand Cordon of the Alexander Order. He continued to write prolifically

on military strategy despite returning to advise Czar Nicholas during the Crimean War (1854–1855) and Napoleon III for the Italian campaign (1859). Jomini died on March 22, 1869, in Paris, at the age of 90.

Having published dozens of works on warfare by the age of 50, Jomini had cemented his reputation as one of the foremost authorities on military strategy. In his studies of Napoleon, the French Revolution, and Frederick the Great, Jomini emphasized what he considered to be the operational principles on which success in warfare depended: the importance of interior lines of communication, turning the flank of an enemy force, and the use of superior power at decisive points. Moreover, in his writings, Jomini highlighted the element of surprise, the methodical deployment of troops, the complete destruction of the enemy, and the control of geographic locations. Critics countered his writings by expounding on those of the Prussian military theorist, Carl von Clausewitz, who saw warfare in broader terms that were influenced by sociopolitical factors. While Clausewitz died in 1831, 38 years prior to the Swiss writer, historians would later recognize the two men as important military theorists.

Jomini's works were influential beyond Europe, having been translated into English and incorporated into the curriculum at the United States Military Academy at West Point during the early 19th century. As a result, senior officers in both the Union and Confederate armies began the war adhering to the principles set forth by Jomini but eventually moved away from those concepts as the reality of geographic limitations and advanced technology forced them to modify their strategic views during the Civil War. Jomini's theories were also discredited during the Austro-Prussian and Franco-Prussian Wars in which the victorious armies abandoned his rules for concentration of forces and the emphasis of interior lines. Yet Jomini's influence on military thought and strategy is without question as his works are required readings for military officers. In addition to his *Treatise on Grand Military Operations*, Jomini also wrote *Les principes de la stratégie* (1813), *L'histoire critique et militaire des guerres de la Révolution, 1792–1803* (15 vols., 1820–1824), *La vie politique et militaire de Napoléon* (14 vols., 1827), and *Précis de l'art de la guerre* (2 vols., 1838), among other works.

JOURNALISTS, EMBEDDED

Embedded journalists are accredited members of the press attached to military units in combat. They are tasked with providing the domestic and international public with news and information, as well as a firsthand account of conflict in the 21st century. Embedded journalists are given the opportunity to live with a unit or rotate throughout a battalion during an authorized operation or campaign, in accordance with Department of Defense (DOD) policy and criteria surrounding the conflict. Their role and presence in the conflicts have increased in proportion with the public's interest in the events of the conflicts in which the United States is participating.

Embedded journalists are distinguished from military public affairs officers, who are members of the military charged with relaying the official line of information from the military to the public as well as other members of the press. This entry discusses the history of embedded journalists and examines the relationship between the DOD and the media.

History of Embedded Journalists

War reporting has occurred throughout American history, from coverage of the fight for American independence by amateur journalists to photographers documenting developments of the Civil War.

But in the 20th century the concept took on new dimensions. The development of communication technology from the telegraph to the radio allowed for information to be disseminated more quickly, and the public's interest in developments grew. Today, television and the Internet provide the user with almost instantaneous information on the events of a conflict, with details such as the progress of an offensive and recent casualty figures, often with photographs of those involved.

The term *embedded journalist* was first officially used during the 2003 invasion of Iraq. After massive criticism of DOD media policy during the 1991 Persian Gulf War and the 2001 invasion of Afghanistan, the DOD implemented the policy to rectify previous failures at keeping the public informed.

Although DOD media policy evolved with each conflict, it experienced its greatest advances in the aftermath of the Vietnam War. Perceived media biases and their unintended effects on the development and outcome of the war prompted major revisions in how the American military interacted with the media and the American public. The DOD enacted several new access policies, including the creation of media pools, wherein journalists or photographers input their information, which is then made available to all accredited members of the press. The responsibility for coverage was determined on a rotating basis to ensure equal access and equal distribution of the costs and risks associated with sending a reporter and crew to cover a war.

The DOD's media policy was put to its first real test with the start of the air campaign against Saddam Hussein's Iraqi army as part of Operation Desert Storm. The military proved unable to adequately handle the information needs and requirements of embedded and media-pool journalists traveling with units. There were not enough public affairs officers to monitor the interaction between members of the military and the press; the technological capacity to allow journalists to file their stories in a timely manner was insufficient. The press was loath to follow precautions established for operational security (OPSEC); overall, they exhibited a lack of military knowledge and failed to respect other guidelines for their own security in a live combat zone. The media policy proved ineffective and maladapted to the situation, while the press was not prepared for the realities of the situation. The DOD and the media would

experience a chill in relations following the failures of the war, which would only be exacerbated by the landing of marines in Somalia amid the floodlights of live camera crews.

Embedded Journalists in the 21st Century

After the failed attempts at a working relationship in previous conflicts, the 2001 invasion of Afghanistan provided an opportunity for both actors to work together. Unfortunately, media coverage of the invasion was limited and reflected an unwillingness by the military to provide firsthand access to military operations to a media perceived as biased in either direction. The 2003 invasion of Iraq and subsequent counterinsurgency operations exhibited a new phase in the DOD-media relationship. As scrutiny for American military operations in the Middle East increased at domestic and international levels, the DOD allowed embedded journalists to avoid the problems caused by unmonitored and unaccompanied journalists in a theater of war. Although the media policy surrounding their use was limited and outdated at first, over the course of operations, the policy evolved as did the media's understanding of war coverage. The 21-century phenomenon of mass and social media, amplified by globalization, greatly increased the coverage provided by embedded journalists. The effects of their coverage can be seen in the public reaction to military operations domestically as well as around the world, as the media pools allowed accredited foreign press to acquire information as well. The content and breadth of DOD media policy evolved substantially during the Iraq War and has attempted to address many of the errors and mistakes of previous conflicts.

Despite the perceived success of the use of embedded journalists in satisfying the needs of the military and the media during conflicts, there have been many charges leveled against both as to the neutrality of the coverage and access to information. Charges of biased portrayals, slanted in favor of the pro- and antiwar movements were rampant given the nature of the coverage. The popular spin on "embedded journalist" was that of an "in-bedded journalist" implying that the journalist in question was no longer unbiased but, rather, reflected the official DOD line of information. Questions revolved around issues of journalists remaining neutral when their lives depended on the military. Conversely, issues

concerning unfettered access to military personnel and operations in light of the presence of public affairs officers and other perceived censure mechanisms were prevalent as well.

Embedded journalists often place themselves in the line of fire to provide an in-depth view of the events of a war. The level of danger is directly related to the mission of the unit to which the reporter is assigned. During the Vietnam War, Joseph Galloway was assigned to the airborne infantry that fought the Battle of Ia Drang. He was airlifted with the soldiers, was present for the entirety of the battle, and later co-wrote the book, *We Were Soldiers Once . . . And Young*, which served as an influence for a film of the same name. Evan Wright, on the other hand, spent a month with members of the elite Marine 1st Reconnaissance Battalion. During that time, he was often in the lead vehicle and was present during a number of battles during that time. Writing articles focused on the marines' warrior culture for *Rolling Stone*, his work culminated in the book *Generation Kill*, transformed into a TV miniseries. Embedded journalism is not without its risks, however; seven embedded journalists were killed between 2003 and 2009 in Iraq alone.

Media coverage of conflicts in the 21st century has increased in the wake of globalization, mass media, and the public's need for more information. This has been met by cooperation between the military and the press through the use of embedded journalists.

JUST WAR TRADITION

The *just war tradition* is an evolving discourse on how individual soldiers and their commanders may make war ethically or how they can pursue their nation's interests with armed force while retaining their essential humanity. Rooted in the work of Roman jurists as elaborated by medieval Christian theologians, most prominently Saints Augustine and Thomas Aquinas, its precepts were gradually accepted by 18th- and 19th-century soldiers as elements of the "customary usages of war." Later, in a more systematic process, the "tests" of the just war tradition became structural elements of international law via the Hague Conventions of 1899 and 1907 and the Geneva Conventions of 1864, 1906, 1929, and 1949.

The morality of a nation's *resort* to war and its ethical *conduct* of war can be evaluated from three alternative philosophical perspectives: pacifism, realism, and the just war tradition. The pacifist denies that any war can be prosecuted ethically or that it can generate a moral outcome. It is the pacifist's duty to nonviolently oppose and refuse to participate in, or otherwise support, all wars. In contrast, the realist denies that a sovereign nation can behave either morally *or* immorally. A nation-state's highest obligation to its citizens is to ensure its own survival and protect its critical interests by any means determined necessary after judicious consideration of existing threats. In this view, excessive levels of state violence are usually counterproductive but are not immoral per se. For the realist, war is a regrettable but natural aspect of human existence, and the first duty of a head of state is to continually weigh the military capabilities and intentions of competing states in a "structurally anarchic" world. The third philosophical synthesis, the just war tradition, occupies a middle ground between pacifism and realism. It holds that while war creates evil, the extent of that evil can be limited. Its advocates believe that while wars *can* be initiated morally and conducted ethically, it is extremely difficult to do so in practice. To this end, just war theorists have assembled a *reasonable* set of principles observable by fallible individuals making decisions of life and death under great stress. Statesmen and soldiers must conform to its fundamental injunctions, which have been codified into the U.S. military's Law of Armed Conflict.

Politicians and security intellectuals increasingly mobilize just war terminology in arguing for and against various militarized foreign policy initiatives, which indicates both the widespread diffusion of those categories and, less reassuringly, the possibility of their rhetorical use against the grain of their original intent.

This entry explains the basic "tests" of the just war tradition. It does not examine the differing opinions that exist within the pluralistic community of just war advocates on the application of those tests in specific scenarios within different military environments. When codified into international law, just war precepts have historically privileged the *external* security of the sovereign nation-state over the search for peace and justice *within* specific states. In this "Westphalian," or positive law, view, all states are formally equal, regardless of disparities in size, wealth, power, and internal politics. Thus, all nations, even "dictatorships," have a right to control their territory free of aggression from other states. In contrast, just war theorists working from a natural law perspective are less concerned with the sanctity of the Westphalian state and are more concerned with the creation of "civil peace" *within* nations, particularly those suffering under totalitarian regimes.

Jus ad Bellum: Tests That Apply to the Resort to War

Five tests apply to a nation's resort to war. First, war may only be waged by *sovereign authority*. War may not be justly initiated by a constituent element of a state, such as its military acting without authorization, or by an ethnic group or political movement seeking to draw the nation into a struggle it commences in pursuit of its own grievances or interests. Second, war must be waged in a *just cause*: to overturn or prevent an actual or imminent wrong in order to reestablish a state of peace. With respect to "wars of choice," in rare cases a *preemptive* war may be retrospectively determined just, but the evidentiary standard for a nation striking first is very high, and it must be able to present proof of an imminent attack, as Israel was able to do after it destroyed the Egyptian Air Force on its airfields in June 1967. In contrast, a *preventive* war undertaken to destroy or disarm a hostile state or political regime because of a threat it poses,

however acutely that threat is felt, fails the test of just cause. Thus, in ejecting the Iraqi army from Kuwait in 1991, the U.S.-led coalition was fighting in a just cause, the restoration of Kuwaiti sovereignty and reestablishment of peace. In contrast, the coalition that removed Saddam Hussein from power in 2003 failed to produce Iraqi weapons of mass destruction and, thus, could not meet the evidentiary threshold for a just preemptive war.

Third, war must be waged with the *right intention*: to restore peace and return to the *status quo ante bellum*. Right intention reinforces just cause by discouraging nations from expanding their war aims with the success of their armed forces. President Harry S. Truman transgressed this principle when he permitted General Douglas MacArthur to cross the 38th Parallel in October 1950, thus expanding U.S. aims beyond the defense of one sovereign state, South Korea, to encompass the elimination of another, North Korea. Most wars of “regime change” are unlikely to meet the test of right intention, as they seek to change the balance of power regionally or globally and not to preserve a peaceful (however tense) equilibrium between the existing set of actors. However, some just war theorists have argued that a war may be justly initiated to create civil peace for the inhabitants of a nation oppressed by a tyrannical regime, even in the absence of an imminent security threat to neighboring sovereign states.

The fourth test of *jus ad bellum* is *last resort*: All reasonable nonmilitary means to redress the wrong threatening to cause the war must first be exhausted. Good faith diplomatic initiatives must, thus, precede military action. Here again, the Persian Gulf War of 1990–1991 provides an excellent illustration of both right intention and last resort: the 4-month buildup of coalition forces in Saudi Arabia, while primarily aimed at assembling overwhelming combat power, concurrently attempted (unsuccessfully) to coerce Saddam Hussein into evacuating Kuwait. In addition, President George H. W. Bush ended the ground campaign when the preconflict status quo had been reestablished, resisting the temptation to “finish the job” by occupying Baghdad and ending Baath party control of Iraq.

Finally, a nation resorting to war must have a reasonable *hope of success*. This test was originally intended to discourage weak principalities from defending themselves against stronger neighbors

if the near-certain result would be national defeat and unnecessary suffering for their subjects. While this no longer appears to be a meaningful consideration, a second interpretation of hope of success emerged during the U.S. counterinsurgencies in Afghanistan and Iraq. As emphasized in the work of Carl von Clausewitz, statesmen and soldiers must understand the unique elements of the war on which they embark to know if their aims can actually be achieved within the total national means and at a bearable cost in time, wealth, and lives, including the lives of civilians, which is a critical concern of the proportionality test discussed below. Reasonable hope of success would thus seem to caution great powers against launching “nation-building” counterinsurgency campaigns unless they possess an accurate understanding of the cultures in which their militaries will operate.

Jus in Bello: Tests That Apply to the Conduct of War

The two tests of *jus in bello* mark a transition from the realm of statesmen and national leaders to the working world of the soldier in contact with enemy combatants and civilians. While proportionality and discrimination are analytically distinct, they become intertwined “on the ground.” If equal concern is given to both, they are mutually reinforcing. The reverse is also true: When one principle erodes, the other is damaged.

The just war tradition is a *rights-based*, as opposed to a utilitarian, moral calculus. Innocents possess a special immunity that cannot be traded off against any other consideration in any set of circumstances. A nation can easily transform what began as a just war into an unjust war through poorly regulated violence, and the *jus in bello* tests are intended to prevent this depressingly common outcome. A nation may not mitigate disproportionate or indiscriminate actions over the duration of a war with a surplus of right in the conflict’s outbreak: *jus ad bellum* and *jus in bello* tests must be separately satisfied throughout the length of the conflict.

War must be waged with *proportionality*: The good must outweigh the bad; unregulated violence must not be permitted to subvert just ends. *Macro proportionality* involves weighing the universal goods and evils likely to result from different strategic and operational courses of action to avoid

erosion of the right intention. *Micro proportionality* operates at the tactical level of war and requires military chains of command to rule out excessively lethal (against people) or destructive (against essential infrastructure) weapons or tactical practices not necessary to the defeat of the enemy's military.

War must also be waged with *discrimination*: There must be no avoidable killing of innocents; noncombatants are *morally immune* from attack. However, the doctrine of *double effect* permits actions that result in civilian deaths if the action was not intended as a means of defeating or terrorizing the enemy. Similarly, the structures of civil society are not legitimate military targets. However, a *dual use* target, such as a city's electrical power grid, may be struck if, for example, it supports both a hospital and a military antiaircraft radar system. The burden of proof lies on the military commanders to demonstrate that the military value of the dual use target exceeded the primary or secondary risks to noncombatants.

A corollary to the principle of discrimination extends protections to prisoners of war and soldiers who attempt to surrender in good faith: All soldiers who fight under sovereign authority are morally equal, even those whose nation is prosecuting an unjust war. Thus, German soldiers who were members of antipartisan units operating in Eastern Europe, Greece, and Yugoslavia had a right to expect their surrenders to be accepted at the close of hostilities, even those who were later subjected to prosecution for individually committed war crimes. However, soldiers and civilians constitute separate moral categories: Soldiers are expected to risk their lives; civilians have a right to expect theirs will not be taken or casually risked, no matter how attractive a specific utilitarian calculus may appear at the moment. The just war theorist thus cannot justify either the 1945 incendiary attacks on Tokyo or the atomic bombing of Hiroshima and Nagasaki with elements distilled from the just war tradition. Even if recent studies of probable American combat casualties during an invasion of the Japanese home islands are correct, it is impermissible for a nation at war

to avoid 250,000 or 500,000 combatant casualties by intentionally killing noncombatants, as civilian workers in military industries do not forfeit their noncombatant status.

Conclusion

Just war thinking does not *require* any sovereign state to initiate military action in any given situation. War is always a *choice* regardless of how constrained any nation's options may appear to be. Some contemporary security specialists have argued that classical just war imperatives have been rendered obsolete by the terrorists attacks of September 11, 2001, a view subsequently reinforced by a steady proliferation of "weak," "failed," and "rogue" states and violent nonstate actors. However, as developed nations struggle to deal with these emerging threats, the seven tests of the just war tradition remain the best tools available to maintain appropriate limits on *state* violence in international relations.

K

KEEGAN, JOHN

Born in Clapham, England, Sir John Desmond Patrick Keegan (1934–2012) was the son of a World War I veteran. Although he never served in the military, growing up during World War II, as well as being the son of a veteran, sparked his interest in war and conflict. When he was 13, orthopedic tuberculosis caused a disruption in his education, but he did not allow his illness to delay him for long. Educated at King's College, Taunton, and Wimbledon College, London, Keegan entered Balliol College, Oxford, in 1953, where he completed his studies before beginning work at the American Embassy in London. He remained at that post for 3 years, and in 1960, he joined the academic staff at the Royal Military Academy at Sandhurst as a lecturer in military history and served a tenure of 25 years. During this time, he had been a visiting professor at Princeton University, New Jersey, and the Delmas Distinguished Professor of History at Vassar College, New York, and had firmly established himself in the profession through his numerous publications on a wide range of topics related to military history. In 1986, Keegan's career took him in a new direction, and he left Sandhurst and became a defense correspondent for the *Daily Telegraph*. Keegan's list of honors included Fellow of the Royal Society of Literature, Officer of the British Empire, and a Knight Bachelor in 1999 for services to military history. Keegan passed away at the age of 78 in 2012, and on his death, his achievements were acknowledged in the form of an obituary in the

New York Times. This entry discusses the works and influence of John Keegan.

The Face of Battle

A prolific writer, Keegan has been influencing students of military history, both civilian and military, since he began lecturing at the Royal Military Academy, and Keegan often relied on case studies to facilitate his examination of the evolution of tactics, strategies, and commanders. Among his most widely read books are *The Face of Battle* and *The Mask of Command*. In *The Face of Battle*, Keegan examines three pivotal battles—(1) Agincourt, (2) Waterloo, and (3) the Somme—to make broader generalizations about the evolution of infantry fighting and to predict the future of battle. He explains how the fog of war isolated both the ranks and the officers, as a result of the vast expansion of the killing fields and improvements in weaponry, communication, and logistics. In contrast to Agincourt, which was fought in a day and where senior leaders could personally survey the battlefield, the Somme unfolded over several weeks in a battlefield that stretched for miles. In many respects, Keegan's *The Face of Battle* has been his most influential book and has been instrumental in shaping scholarship that focuses on the social history of battle. In *The Face of Battle*, Keegan set, as well as raised, the bar for military historians, who eagerly accepted the call to examine the battle from the perspective of the rank and file. The result has been a body of scholarship that investigates the social history of battle and of war and includes,

among others, Fred Anderson's *A People's Army: Massachusetts Soldiers and Society in the Seven Years' War* (1984), Jason Phillips's *Diehard Rebels: The Confederate Culture of Invincibility* (2007), Carol Reardon's *Pickett's Charge in History and Memory* (1992), and Stephen E. Ambrose's *Band of Brothers* (1992).

Other Scholarship

Keegan set the standard with his seminal work, and critics, noting the prolific number of books he wrote since the 1970s, suggest that none of his later work quite met that standard. Despite that suggestion, his books still rightfully garner much attention, foster debate among military historians, and continue to be influential. Though they received mixed reviews from historians, particularly military historians, some of these works still require mention.

In *The Mask of Command*, Keegan assessed the leadership qualities of famous commanders—specifically, Alexander the Great, the Duke of Wellington, Ulysses S. Grant, and Adolf Hitler—to illustrate the nature of generalship, which he divided into two types—(1) heroic and (2) directorial. In evaluating these four commanders, he demonstrates the ways in which they are both similar and different and what worked for them and what did not. Keegan (1988) argued in *The Mask of Command* that

the leader of men in warfare can show himself to his followers only through a mask, a mask that he must make for himself, but a mask made in such form as will mark him to men of his time and place as the leader they want and need. (p. 11)

In *The Price of Admiralty: The Evolution of Naval Warfare*, Keegan examines naval combat and uses a case study approach to examine the battles at Trafalgar, Jutland, Midway, and the Atlantic. In this study, he demonstrates the ways in which naval combat changed during the 19th century and the first half of the 20th century and the technologies and commanders that fostered change. As Peter Paret aptly noted in his *Journal of Military History* review, Keegan, in *The Price of Admiralty*, provides a reinterpretation of “known” facts, not a new assessment of these naval battles. Using an approach that worked in *The Face of Battle*, however, Keegan's discussions of individuals in extreme

danger stand out. Although he gives Keegan credit for his efforts to discuss all aspects of these battles, including his assessments of technological, social, and economic changes, as well as the impact of personalities, Paret ultimately provides a mixed review of *The Price of Admiralty*. Although he suggests that it does not quite meet the standard set by the earlier, more influential work—*The Face of Battle*—Paret argues that it still makes a contribution to military history and sparks naval history discussions.

Keegan wrote on a wide range of topics. Like other leading military historians, he focused on both national and world conflicts. His work in these areas include *Fields of Battle: The Wars for North America*, *The American Civil War: A Military History*, *The First World War*, *Six Armies in Normandy: From D-Day to the Liberation of Paris*, *The Second World War*, *The Battle for History: Re-Fighting World War Two*, and *Who Was Who in World War II*. Not one to shy away from broad or current topics, Keegan continued to make contributions to military history with monographs, such as *Intelligence in War: Knowledge of the Enemy From Napoleon to Al-Qaeda*, *A History of Warfare*, *The Battle for History*, and *The Iraq War*.

In some respects, Keegan took a different approach in *A History of Warfare* than in his earlier works. Focusing on the anthropology of war, he examines war as a “cultural formation.” Keegan bravely challenges Carl von Clausewitz's theory that “war is the continuation of policy by other means,” and he suggests that, according to Clausewitz, war should replace policy. In addition, he argues that Clausewitz did not account for warfare by nonstate actors, such as that employed by al Qaeda. Not willing to analyze only one aspect of warfare, Keegan uses a discussion of intelligence to present another history of war. With skillful writing, he again demonstrates the breadth of his understanding of military history. Drawing on the template that has worked so well for him in the past, Keegan uses seven case studies to weave his story. Keegan stated how useful intelligence was in war. However, he ultimately concluded “that intelligence in war, however good, does not point out unerringly the path to victory” and stressed the supporting role it played in achieving military success (Keegan, 2003, p. 6).

Keegan was an influential scholar and teacher of military history. His books are read by civilian

and military students and have broadened their understanding of the nature of war. As one of the leading authorities on military history, his scholarship has sparked debate and challenged students to emulate him. In his job as defense editor at the *Daily Telegraph*, Keegan was in a position to influence a broad public audience and policymakers, as well as combat commanders. For instance, Keegan briefed President Bill Clinton prior to his journey to Normandy, France, in 1994, to commemorate the 50th anniversary of the D-Day invasion.

KOREA, NORTH

North Korea is one of the world's most reclusive societies. Although its leadership recently transitioned, the small Asian country has been a security concern for the United States since the end of World War II and has been at war with the United States since the Korean War Armistice was signed in 1953. North Korea continues to cause tension in the Far East, building nuclear and other weapons and threatening war with South Korea and its allies. This entry examines the history and economy of North Korea, the influence of controlling leaders such as Kim Il Sung and his progeny, North Korea's relationship with South Korea and other countries, and its nuclear program.

General Information

The state of the Democratic People's Republic of Korea (DPRK or North Korea) gained its independence from Japan following World War II and officially established its government on September 9, 1948. The capital of North Korea is Pyongyang, located in the southwest of the country.

North Korea lies directly north of the Republic of Korea (South Korea) on the Korean Peninsula and is slightly larger than its southern counterpart. North Korea is bordered by China and Russia in the north. The Yellow Sea (also known as the West Sea by Koreans) lies to its west and the Sea of Japan (also known as the East Sea) to its east. Approximately 80% of land in the DPRK is mountainous. Recent estimates calculate the amount of arable land between 20.7% and 22.4%.

History

Pre-World War II

Up to the 1st century CE, the Korean Peninsula was the site of the Old Chosŏn civilization. As the Chinese gained more power, the Old Chosŏn

federation declined, and three new states emerged. One state, Koguryŏ, was located in the northern part of the peninsula. Koguryŏ developed during the 1st century CE and continued to expand until its defeat in 313 CE. North Korean historians claim Koguryŏ as the most important period in their history. Two other states, Paekche and Silla, also grew in power. This period (246–668 CE) is known in Korean history as the Three Kingdoms period. By 676 CE, the Silla emerged as the sole power and prospered for more than two centuries before declining.

A new state known as the Koryŏ grew in strength, which is where the name Korea originated. The Koryŏ Dynasty lasted until 1392 and established an aristocratic hierarchy on the peninsula. Korean society was highly influenced by Chinese civilization during this period.

After a series of Mongol invasions, the Koryŏ court fractured. One group emerged victorious and established the Chosŏn Dynasty. The new state lasted from 1392 to 1910 and established its capital at Seoul. A new Korean culture developed during this period, highly influenced by Confucianism. An alphabet, *hangul*, was also developed during the Chosŏn Dynasty by a king in the 15th century. *Hangul* is still used today in North Korea.

During the Chosŏn Dynasty, Korea faced several invasions from the Japanese. The Chosŏn were able to defeat the Japanese in the 16th century and establish a relationship with the Qing Dynasty in China. As the Chinese declined in power, the Japanese became powerful and eventually forced an unbalanced treaty on the Koreans, affecting trade and land rights. Russia and Japan struggled to claim the Korean Peninsula for their own, splitting Chosŏn at the 38th parallel.

Japan ultimately claimed Korea as its own colony in 1910 following victory in the Russo-Japanese War. The Japanese installed a new government on the peninsula, changing the official language to Japanese. Feeling defeated and dishonored, the Korean people began to fight back in the 1920s by establishing nationalist and communist parties. North Koreans trace their ideology and leadership to the Japanese resistance fighters, specifically in Manchuria. One fighter turned leader in Manchuria was Kim Il Sung.

World War II to Korean War Armistice

Despite Korean hopes for a unified and independent country, an agreement between the Soviet

Union and the United States brought Soviet troops north of the 38th parallel in August 1945, and American troops occupied the peninsula south of the 38th parallel that September. The first government created was the Interim People's Committee in February 1946, led by Kim Il Sung. The Korean Communist Party and other groups combined in August 1946 to form the new dominant political group called the Korean Worker's Party, which still survives today. Kim continued to be the commanding voice of North Korea. Shortly after the Republic of Korea was founded, Kim announced the birth of the Democratic People's Republic of Korea on September 9, 1948. The new state's capital would be at Pyongyang.

American troops in South Korea had helped suppress communist and other guerrilla movements but were unprepared for total war. On June 25, 1950, Kim ordered North Korean troops to move into South Korea. After war had consumed the entire peninsula, an armistice was signed, and the demilitarized zone (DMZ) was established at the 38th parallel on July 27, 1953. Both the armistice and the DMZ still exist.

Kim Il Sung and Juch'e

Kim Il Sung and the Korean Worker's Party established a socialist command economy in North Korea. The new state's agriculture would be communal, and the economy would mainly focus on industrialization. Kim's model of communism was called *juch'e* and permeated all walks of life. *Juch'e* meant independence in politics, economic self-reliance, and self-defense.

Kim was unchallenged in his rise to become leader of the Korean Worker's Party. By 1956, he controlled all facets of North Korean government and life. While South Koreans have been influenced by a number of cultures and religions, North Korean society is strictly influenced by Kim Il Sung. The "Great Leader" was and still is greatly revered in North Korea and gained an almost godlike status.

After the Korean War, a period of obstinacy ensued for both North Korea and South Korea. A series of meetings between the two states finally led to the announcement in 1976 that they would seek peaceful reunification. In 1979, however, the United States revealed its intention to keep troops on the Korean Peninsula. North Korea then began to improve its military capabilities and build tunnels under the DMZ. The next few years brought

about talks between the United States, North Korea, and South Korea, as well as direct talks between the United States and North Korea, sponsored by the Chinese. Small advances were made through North-South family visitations and Seoul investment in North Korea, but Pyongyang continued to cause concern through its nuclear program, weapons sales, and drug trafficking.

Kim Jong Il

The “Great Leader” suddenly died on July 8, 1994. Kim’s son, Kim Jong Il, had been prepped to take over his father’s position since the 1980s and became the chairman of the National Defense Commission and commander in chief of the military in April 1993. Despite being the heir apparent, Kim Jong Il was not declared the general secretary of the Korean Worker’s Party until 1997. Nicknamed the “Dear Leader,” Kim continued his father’s dictatorial rule. Severe economic downturn and famine pushed the reclusive society further into danger of collapse.

Kim was known for his eccentricities. His attempts to disguise his height (5 feet 3 inches) by wearing platform shoes and a bouffant hairstyle made him recognizable throughout the world. He was also known to spend extravagantly on luxuries. He possessed expensive cars and luxurious vacation houses, and brought in liquor and food from all over the world. He had a movie library into the tens of thousands and kidnapped a South Korean filmmaker and his actress girlfriend in the 1970s and forced them to produce films for him. North Korean official reports even attempted to create a divine status for the “Dear Leader,” changing his birth date and birth story to a more mythical tale.

Kim reportedly suffered a stroke in 2008. While he tried to maintain a visible presence in North Korea, he was becoming conspicuously weaker. Kim died on December 17, 2011, at the age of 69.

Kim Jong Un

Kim Jong Un was born in 1983 or 1984 to Kim Jong Il’s third wife. He was educated in Switzerland but reportedly resisted Western influences. He returned to North Korea frequently and attended Kim Il Sung Military University on his final move home. As early as 2009, South Korean intelligence reported that the “Dear Leader” named his youngest son, Kim Jong Un, as his heir. Kim Jong Un was given progressively higher political posts over several years, and

he attended many high-profile events with his father after his father’s stroke in 2008.

After his father’s death, Kim Jong Un was declared the “great successor” and was named head of the party, state, and military. A few months after his succession, North Korea launched a rocket, claiming it was meant to put a satellite into orbit. The rocket failed but set off international concerns as a breach of the ban on long-range missile technology. As with Kim Jong Il, the North Korean media has spent months building up Kim Jong Un’s personality. It was revealed in 2012 that Kim was married to Ri Sol Ju. They may have been married as early as 2009, and not much is known about the dictator’s wife. She always appears well dressed in public, with designer clothes and accessories.

Society and Economy

North Korea’s population was estimated to be 23.3 million in 2007, and 60% of its citizens live in urban areas. Traditionally, the agricultural areas had been unable to feed the entire population, and this led the North Korean government to import food with the finances provided from exports of industrial products.

Due to a series of droughts and floods in the mid-1990s, arable land dramatically diminished, and the need for more imported foods rose. A further decline in industry left Pyongyang unable to finance more imports. North Korea suffered the worst famine in the late 20th century, and the only famine to hit a country not at war. The famine lasted through the mid- to late 1990s and left more than 1 million people dead. Most of the deaths occurred from diseases related to malnutrition and poor water supply, affecting mainly the elderly and very young.

North Korea is still facing major food shortages. The crisis was recently made worse by widespread flooding in June and July of 2012. Hope of international aid was dampened when the United States refused to send further food supplies after North Korea’s failed rocket launch. It is reported that the government has decreased individual food rations to 700 calories a day (an average, healthy adult should get around 2,000 calories a day).

Life for the politically elite is markedly different from that of an average North Korean’s life. Pyongyang, rebuilt after the Korean War, boasts clean streets and spacious living for those allowed to live there. Services in the capital are far beyond what the rest of the country has, providing new hospitals

and a state-of-the-art Children's Palace, where children of the privileged can learn various arts and sports.

Any opposition, real or perceived, to the North Korean government or leadership is met with swift retribution. An extensive system of work and prison camps is run by the government to house political prisoners, criminals, and their family members. Human rights organizations report severe conditions, and large numbers of prisoners die from starvation, exhaustion, and torture. The North Korean government denies the allegations of human rights violations.

International Relations

Russia and China

Without support from China and the Soviet Union, North Korea would probably not have established its own state. Until the end of the Cold War, both China and the Soviet Union provided markets for North Korean goods and supplied the country with oil and other needs. The former Soviet state established relations with South Korea in 1990, and China followed in 1992. While the Soviets abandoned North Korea in search of larger markets in South Korea, the Chinese have tried to balance relations with both Koreas. China has established extensive economic ties with South Korea since the early 1990s, but it continues to support the North Korean economy, most likely for historical reasons as well as for prevention of regional destabilization and mass population migration across the Chinese border if North Korea collapses.

Japan

North Korea's ties with Japan have been strained since World War II. Although North Korea professed a desire to have diplomatic and economic ties with Japan, support among the Japanese people deteriorated. Japanese citizens were kidnapped by North Korea and never found, Japanese visitors to North Korea were prevented from communicating with family in Japan, North Korea granted safe haven to a Japanese terrorist group in 1970, and Pyongyang consistently failed to pay debts to Japanese businesses. Although a series of diplomatic talks was initiated in the 1990s, a stalemate ensued over North Korea's demand for colonial reparation payments and Japan's precondition of information on its

abducted nationals. Eventually, Kim Jong Il admitted that the Japanese nationals were abducted, and Japan refused to return the captives to Pyongyang after visits to Japan were granted. Tensions between the two countries are also marked by North Korea's testing of a ballistic missile over Japan in 1998 and several incidents involving North Korean ships.

The United States

The United States and North Korea have had a long history of distrust since the end of World War II. North Korea views the United States as evil and the largest imperialist nation in the world. The United States sees North Korea as a rogue state and a continuing security risk. Several events since the Armistice in 1953 have perpetuated U.S. distrust: North Korea's seizing of the USS *Pueblo* in 1968, shooting down a U.S. reconnaissance plane in 1969, killing two U.S. officers at the DMZ in 1976, assassinating South Korean cabinet officials in 1983, and the terrorist bombing of a South Korean civilian airliner off the coast of Myanmar in 1987.

Toward the end of the 1980s, relations began to thaw between the United States and North Korea. Many cultural and educational exchanges took place during this time. Both Koreas were admitted into the United Nations in 1991, which the United States supported. After North Korea agreed to sign a nuclear safeguard agreement with the International Atomic Energy Agency in 1992 and allow inspectors into nuclear facilities, the United States and South Korea canceled the annual Team Spirit exercises. Further discussions between the two countries led to a joint statement in 1993.

The temporary turn of good relations did not last long. North Korea refused to stop its nuclear program and allow inspectors into the country in 1994. Although the United States was prepared to go to war, former president Jimmy Carter was able to step in and enable last-minute negotiations between the United States and North Korea. A new agreement was reached by the end of the year for the denuclearization of the Korean Peninsula. The agreement allowed for each country to take small steps to show their cooperation. Although the United States met its obligations of shipping fuel to Pyongyang, North Korea continued to inflame U.S. allies by testing ballistic missiles and allegedly building other weapons of mass destruction. Further negotiations took place

throughout the 1990s, and U.S. Secretary of State Madeleine Albright even made a visit to Pyongyang in 2000 to meet with Kim Jong Il.

Despite what appeared to be a nuclear stalemate, President George W. Bush declared in October 2002 that North Korea was violating the 1994 agreement by secretly working on a nuclear program. Pyongyang claimed it was their right to build weapons if the United States continued to be hostile, and subsequently, North Korea broke from the 1994 agreement, expelling inspectors from the country.

South Korea

Above all other countries, South Korea has most aggressively pursued engagement with North Korea in the 21st century. In 1998, the newly elected South Korean president Kim Dae Jung formed and pursued the Sunshine Policy, created to end hostilities with Pyongyang and develop economic and cultural ties through various channels. The popular program resulted in a rapid rise of trade between the two countries and numerous South Korean companies opening businesses in North Korea. Hundreds of thousands of South Koreans were also permitted to visit North Korea in the early 2000s, and tourism to North Korea has steadily increased since that time. A significant trip by Kim Dae Jung to North Korea in June 2000 further underscored joint principles of peaceful reunification.

Despite working toward a stable relationship, South Korea is still cautious about its security. U.S. troops remain in South Korea, and nuclear threats/testing done by Pyongyang have balanced public opinion that was beginning to push for a withdrawal of troops.

Nuclear and Other Weapons

North Korea currently has a nuclear program in progress and has tested two nuclear devices. It has tested short- and medium-range missiles and appears to have active chemical and biological programs. North Korea is not a party to the Chemical Weapons Convention or the Comprehensive Test Ban Treaty, and it withdrew from the Treaty on the Non-Proliferation of Nuclear Weapons (NPT) in 2003. The DPRK is also an exporter of missiles and missile technology to countries like Egypt, Iran, Libya, Pakistan, Syria, and Yemen, and it is not a member of the Missile Technology Control Regime.

Nuclear

North Korea's nuclear program began in the 1950s, and its first research complex was built by 1964 at Yongbyon-kun. The nuclear program expanded with Soviet help, and Pyongyang built a plutonium reprocessing plant. Although North Korea became a party in 1985 to the NPT, it did not allow International Atomic Energy Agency inspectors access to facilities until 1992. When inspectors were unable to inspect all the nuclear sites, the United Nations authorized special inspections. In response, North Korea threatened to withdraw from the treaty.

Special bilateral negotiations with the United States led North Korea to agree to suspend its withdrawal from the NPT. An Agreed Framework was reached in 1994, whereby North Korea would agree to halt its nuclear program in exchange for a light-water reactor and oil shipments from the United States, Japan, and South Korea. This agreement stabilized the situation for almost a decade.

In December 2002, a crisis began to take shape in North Korea. Pyongyang announced its intention to restart a nuclear program, expelled inspectors, and, less than a month later, withdrew from the NPT. North Korea officially announced that it possessed nuclear weapons in 2005. It first tested a nuclear explosion device in October 2006.

After the nuclear test, countries with interests in the Far East scrambled to restart negotiations with North Korea. China continued to apply pressure, and Pyongyang returned to six-party talks. In 2007, the talks produced an agreement for North Korea to shut down the facilities at Yongbyon, again in exchange for heavy fuel oil.

North Korea finally submitted a nuclear declaration and destroyed a cooling tower at Yongbyon in June 2008 to show its commitment to the process. However, six-party talks continued to cause a rift between North Korea and the other states, culminating in a North Korean missile test in April 2009. The UN Security Council condemned the move, and Pyongyang subsequently tested another missile and another nuclear weapon in April and May 2009, respectively.

Chemical and Biological

North Korea is suspected of a continuing biological weapons program, despite being a party to the

Biological and Toxin Weapons Convention. Details of Pyongyang's capabilities are sketchy, but a report by South Korea published in 2006 estimated 2,500 to 5,000 metric tons of biological agents in the DPRK's possession, including cholera, smallpox, and anthrax.

Pyongyang is not a party to the Chemical Weapons Convention and is reported to have about 12 facilities that produce or store chemical agents. North Korea can allegedly produce 4,500 metric tons of chemical agents per year, and the military purportedly already possesses several chemicals, including sarin, mustard, and phosgene gas, among others.

Summary

Although leadership has recently transitioned in North Korea, it is unclear if any changes will be forthcoming. Kim Jong Un appears more laid back than his father in public, but approving a rocket launch seemed to be business as usual for the government. The North Korean people still face food shortages and repression, and the future of North Korea is uncertain. In the meantime, the world will continue to keep a careful eye on "The Hermit Kingdom."

KOREAN WAR (1950–1953)

In the early months of 1950, Korea seemed a rather insignificant place to most Americans. Crisscrossed by rough dirt roads and characterized by little other than poverty and illiteracy, the peninsula had been divided at the 38th parallel at the end of World War II, when the United States and the Soviet Union reached a gentleman's agreement on the matter. Since then, various schemes to reunify the "Hermit Kingdom" had found favor in either Moscow or Washington, but no plan had yet satisfied both. With neither Russia nor the United States inclined to press the issue at the risk of war with the other superpower, Korea appeared destined to remain divided between a communist state in the north and a pro-American country in the south without much of a future in world politics or American foreign policy. In fact, when Secretary of State Dean Acheson described the U.S. "defense perimeter" to the National Press Club in Washington, D.C., in January 1950, he did not even mention Korea.

However, after communist North Korean forces crossed the border in the early-morning hours of June 25, 1950, threatening the very existence of Syngman Rhee's U.S.-supported South Korea, the Harry S. Truman administration took note. Much maligned for being "soft on communism" and accused of losing China, Truman politically could ill afford to ignore the events taking place on the small peninsula half a world away, and suddenly, the fate of Korea took on the utmost importance. Convinced of the need to draw a line in the sand and contain communism, Truman quickly ordered the U.S. military to aid in the defense of South Korea and, in the name of "collective security," asked the United Nations to join the effort as well. Within days and without congressional approval, U.S. armed forces began operations in Korea in what the president termed a *police action*. Expected to be a quick holding maneuver, the conflict in Korea soon metamorphosed into an old-fashioned ground war, one that lasted from June 1950 to July 1953. Before its conclusion, the Korean War pulled in not only 1.5 million American troops; the whole of the South Korean army (ROK) and North Korean People's Army (*Inmun Gun*), approximately 95,000 and 135,000 strong, respectively; and millions of

Chinese “volunteers,” but also the combat forces from resources of other countries. Australia, Canada, New Zealand, the United Kingdom, Belgium, Luxembourg, Colombia, Ethiopia, France, Greece, the Netherlands, the Philippines, Thailand, and Turkey all sent soldiers, sailors, or airmen to aid in the United Nations effort, collectively totaling more than 150,000. In addition, India, Italy, Norway, Denmark, and Sweden contributed medical staff and supplies. From these participating nations, the Korean War exacted a steep price. By the time representatives from China, North Korea, and the United Nations gathered at Panmunjom on July 27, 1953, to sign the armistice ending the Korean War, nearly 34,000 Americans, 3,400 UN troops, 415,000 South Korean soldiers, approximately 1.5 million Chinese and North Korean military personnel, and millions of Korean civilians lay dead, and casualties spiraled to even greater heights. This entry traces the course of the war and discusses controversies and the war’s impact.

June to September 1950

During the war’s first phase, from June 25 to September 15, 1950, the North Korean military overran South Korean and American forces, coming close to winning the war and unifying the peninsula under the leadership of Pyongyang. After World War II, the United States, fearful of what actions South Korean president Syngman Rhee might take against the North, deliberately declined to supply South Korea with a powerful or even adequate arsenal of weapons. Conversely, the Soviet Union spent those same years filling the military storehouses of Kim Il Sung’s North Korea. Thus, by June 1950, South Korea had less than a week’s reserve of ammunition, virtually no antitank weapons, and no artillery heavier than 105 mm, while North Korea possessed a 2:1 numerical advantage over its southern counterpart in manpower, overwhelming advantages in armor and artillery, and an equally decisive superiority in the air.

Unsurprisingly, the South Korean capital, Seoul, fell within days of North Korea’s attack, and the defeated ROK army retreated steadily southward. American forces, meanwhile, hastily shipped from occupied Japan, fared no better. The first American ground force to enter Korea, Task Force Smith, met with disaster. Understrength and equipped

with only two 75-mm recoilless rifles, two 4.2-inch mortars, six bazooka rocket launchers, four 60-mm mortars, outdated and worn communications gear, and only a few rounds of armor-piercing ammunition, Task Force Smith proved no match for a column of North Korean T-34 tanks. Sustaining 150 casualties out of 406 soldiers and officers, Task Force Smith suffered the first American combat deaths of the war and, unable to permanently hold the line, delayed the enemy for only about 7 hours. Further south, other U.S. units met with a similar fate, and by the end of August, ROK and American forces claimed control of only a fraction of South Korea—the coastal city of Pusan and its surrounding hinterland.

Pusan, however, served as a valuable port from which noncommunist forces regrouped and augmented their strength until mid-September, when the war’s second phase began with the spectacularly successful American-led Inchon Landing. Conceived of by General Douglas MacArthur and carried out by a force largely composed of U.S. Marines, the seaborne invasion at Inchon turned the tide of the war. The American landing force quickly overwhelmed North Korean resistance and subsequently began an advance on Seoul, which fell to them on September 25. By this time, U.S. and ROK troops, augmented by UN forces, had also broken out from the so-called Pusan Perimeter and begun advancing steadily north. By the last week of November, with UN forces pursuing the remnants of the defeated North Korean army to the Chinese border, almost everyone had reason to believe that this would be the war’s last major offensive.

October 1950 to May 1951

Unbeknownst to the men on the front, Communist Chinese officials decided in early October, following the Inchon Landing and recapture of Seoul, to intervene in Korea should UN forces continue their advance north. Though perhaps willing to tolerate a South Korean presence up to the Yalu River, China would resist an American one on its border. Peking first attempted to deter Washington by having India’s ambassador to China, K. M. Pannikar, deliver a note warning the United States not to cross the 38th parallel. When this attempt at diplomatic deterrence failed, the Chinese People’s Liberation Army began hit-and-run attacks on UN forces,

which, undaunted, continued to advance north toward the Chinese border.

While fully aware of the possibility of Chinese intervention, U.S. policymakers and leaders dismissed the threat for myriad reasons. MacArthur, for example, remembering an older and very different China, personally assured President Harry S. Truman at their October 15 Wake Island meeting that the lack of air cover made effective Chinese intervention impossible. Secretary of State Dean Acheson concluded that China would not risk dependency on the Soviet Union and a potential seat at the United Nations over Korea. Others, recalling China's lackluster performance during World War II, doubted its ability to fight the forces of the United States, much less those of the United Nations. Some insiders, such as Edmund Clubb, director of the State Department's Office of Chinese Affairs, argued that the Chinese threat should be taken seriously, but for the most part, their arguments fell on deaf ears. The president and the State Department simply did not believe that China would enter the war.

In late November, however, China made good on its word, sending as many as 300,000 "volunteers" into the war zone. No longer a peasant army, the war-hardened Chinese People's Liberation Army soon had UN troops on the defensive and retreating south. The Eighth Army was in trouble, but at Chosin Reservoir, the marines and soldiers of the U.S. X Corps, under Major General Edward Almond, were desperate. Encircled by 67,000 Chinese troops, their survival depended on the success of a 14-mile retreat under fire in bitterly cold conditions. Largely due to marine Major General Oliver Smith's caution and planning, the men did break out, but suffered heavy casualties. By New Year's 1951, UN forces had retreated as far south as the 38th parallel, and Seoul again fell to the communists on January 7, not to be retaken by UN forces until March 14. Locked out of North Korea entirely, the situation once again looked grim for the UN effort in Korea.

During the harrowing retreat south, the commander of the Eighth Army, General Walton Walker, died when his jeep collided with a truck north of Seoul, and he was succeeded by General Matthew Ridgway. Ridgway immediately set about trying to boost morale in the war zone, but he barely had time to acclimate to his new position before being elevated further. On April 11, 1951, after conferring with Secretary of State Dean Acheson and the Joint

Chiefs of Staff, President Harry Truman relieved MacArthur of his commands, naming Ridgway as his replacement. By the time Ridgway found himself firmly settled in as supreme commander, UN forces under his command already had slowed the Chinese advance. Operations Killer and Ripper, carried out between February and April 1951, served to close the line south of the Han River, drive the Chinese back with heavy casualties, and win back Seoul. By late March, ROK troops crossed the 38th parallel, followed by UN forces. In the spring, the Chinese People's Liberation Army mounted a 700,000-man-strong offensive, pushing the Eighth Army 18 to 20 miles south, and by the end of May 1951, UN troops again stood at the 38th parallel.

June 1951 to July 1953

Although the Korean War continued for another 25 months, neither side advanced far, and a stalemate prevailed on the front for the conflict's remaining 2 years. Military activity, in fact, focused more on supporting a breakthrough in the peace talks that began on July 10, 1951, at Kaesong and later resumed at Panmunjom than on breaking through the enemy's lines. Rather than unleash all of the conventional and nuclear forces at their disposal, UN leaders pursued a limited war strategy to achieve limited results, namely, a return to the June 1950 status quo.

At the time, men on the front lines bitterly resented both the unwillingness on the part of policymakers to strive for total victory and the constraints placed on them as a result of the decision to work toward a negotiated peace. Soldiers complained that they could not get the ammunition and weaponry they needed because of cost-cutting measures when peace talks seemed about to bear fruit, and pilots balked at orders preventing them from pursuing attacking MiGs across the Yalu River. Generally, combatants felt that limited war denied them even the opportunity for victory. Many Americans on the home front, however, having slipped into apathy toward Korea and the men fighting there after the first few months of the conflict, readily accepted the limited nature of the war. Still, then, as now, scholars wrestled with the implications of this new American way of waging war. G. W. Hudson, for example, argued in his 1951 *Twentieth Century* article, "The Privileged Sanctuary," that U.S. policies with regard to the Korean War amounted to nothing less than

a political defeat for the United States. Later, others pointed out that had the United Nations followed MacArthur's lead, the Cold War might have ended far sooner and with less cost. Many other works, though, take a different approach, lauding the Truman administration for wisely navigating a course to prevent a wider war with China and the Soviet Union.

Despite the limitations placed on units and commanders in Korea, fighting continued until the final hours of the war, with appalling casualties. In the 2-month-long offensive to capture "Bloody Ridge," a string of fortified Chinese positions in the hills overlooking UN forces, fought between July and September 1951, the United Nations suffered 2,000 casualties, while communist losses topped 15,000. A follow-up operation during September and October aimed at dislodging the Chinese from "Heartbreak Ridge," located just north of the 38th parallel, proved even more costly to UN forces, with nearly 3,700 UN and 5,000 communist casualties. The following month, UN forces assumed a defensive posture as peace talks resumed at Panmunjom. During the winter of 1951–1952, UN casualties subsided, yet still averaged 3,000 per month.

With the return of campaign season in the spring of 1952, negotiators at Panmunjom reached an impasse, causing military operations to escalate. By this time, both sides had constructed formidable trench lines reminiscent of World War I, and while the UN forces had greater firepower, the communists, who held a 9:7 advantage in manpower, had significantly augmented their artillery and constructed more elaborate defenses. Accordingly, while 1952 lacked the major engagements that typified 1951 and 1953, artillery duels in which opposing armies expended tens of thousands of shells per day proved common.

As the war continued, the peace talks lagged, breaking down altogether at one point. Thus, for more than a year, negotiators failed to reach an armistice agreement acceptable to both sides. Attempting to explain this long delay, historians have scrutinized the nature of the military officers representing the United Nations and blamed cultural misunderstandings, but ultimately, the heart of the problem lay with the issue of prisoner repatriation. The UN Command, screening the prisoners of war (POWs) under its control, found that as few as 50% wished to be repatriated to North Korea or

the People's Republic of China. Aware of just how that might look to the outside world, China insisted that the POWs be repatriated, whether voluntarily or not. President Truman, however, without regard for international law or the Chinese desire to save face, resolved that no forced repatriation would take place. An increase in fighting and a decrease in talking resulted.

Negotiations at Panmunjom might have remained stalled except that the world outside of Korea changed. From January to March 1953, Dwight David Eisenhower replaced Harry Truman as president of the United States, Soviet leader Joseph Stalin died, and the United States tested artillery-sized nuclear devices. Quite unexpectedly, on March 28, the Chinese and North Koreans announced their agreement to a plan to trade sick POWs in what would become Operation Little Switch from April 20 to May 3. From that point forward, events moved quickly. Full UN and communist delegations returned to the peace table for the first time in half a year to work on hammering out a full-repatriation plan, and sensing the end of the struggle, both sides tried to press their advantage in the war. General Mark Clark requested and received permission to strike at the enemy's food supply by bombing dams in North Korea, and Secretary of State John Foster Dulles intimated that if peace did not come quickly, the United States might begin to bomb north of the Yalu River. Seeking one final victory, the communists launched a series of offensives against UN forces in the "Iron Triangle," north of the 38th parallel in what became the postwar demilitarized zone. At best, these proved only modestly successful, but they resulted in 50,000 UN and 100,000 North Korean and Chinese casualties.

Finally, on June 8, the peace talks bore fruit as participants agreed on a plan to repatriate the POWs. POWs voluntarily repatriating would return home, while those unwilling to repatriate would remain in Korea for 90 days in the custody of a neutral commission, during which time officials from each side would have access to them. This arrangement satisfied the United States, North Korea, and China, paving the way for peace. One last major hurdle remained. South Korean president Syngman Rhee wanted no part of a truce that left Korea divided and refused to sign off on the deal. Pressured by the United States and unable to continue the war unilaterally, Rhee attempted to derail the armistice

by ordering the release of 27,000 noncommunist POWs near Pusan who then melted into the countryside. The gambit failed as China directed its ire at Rhee rather than at the United States, and the talks moved forward. Against Rhee's wishes, but with his forced acquiescence, representatives from the United States, China, and North Korea signed the Korean armistice on July 27, 1953, just 16 days after the fight for Pork Chop Hill, the last major battle of the war.

Although the fighting in Korea ended at 10:00 p.m. on July 27, 1953, the armistice only provided for a cease-fire and did not mark an official end to the war. The UN Command still exists, and American troops continue to be stationed in Korea. Since 1953, several incidents have occurred along the Korean demilitarized zone, and in January 1968, a major crisis occurred when North Korea seized the USS *Pueblo* and its crew, claiming they had strayed into North Korean territorial waters. North Korea released the last crew members in December 1968, but the *Pueblo* remains in their possession.

Continuing Controversies

Although the American public gave the Korean War little thought after 1953, earning it the moniker the “forgotten war,” the conflict has provided much fuel for historical controversy. Since the war's outbreak, for example, the origins of the war have attracted much scholarly debate. Many historians single out Secretary of State Dean Acheson, arguing that by omitting Korea from his definition of the U.S. defense perimeter he encouraged the North Korean attack on South Korea. Indeed, Acheson's speech did make a few headlines at the time, and contemporaries on the right criticized the secretary shortly after the war began. However, as many other accounts of the war suggest, Acheson's speech might have emboldened Kim Il Sung and convinced Stalin that the United States would not intervene, but it was only a fragment of the body of information that led North Korea to invade the south.

Right after the war, attention focused on returning the POWs. Present at Operation Little Switch, army psychiatrist William Mayer determined that many of the POWs had succumbed to brainwashing in North Korea. The army decided that most also had collaborated while in captivity and court-martialed several of its own. Thereafter, a flurry of both

popular and academic writings began to address the topic of what went wrong with the Korean War generation. Cultural icons such as pediatrician Dr. Benjamin Spock and feminist Betty Friedan suggested that coddling mothers or weak characters made these men “soft,” leading to their susceptibility to enemy propaganda. Since then, experts and academics alike have argued over everything from the treatment that the American POWs received from the communists to the honor of the POWs themselves, with the balance slightly tilting toward those seeking to rehabilitate the reputation of men who endured the camps. Lewis Carlson's *Remembered Prisoners of a Forgotten War: An Oral History of Korean War POWs* (2002) and Raymond B. Lech's *Broken Soldiers: American Prisoners of War in North Korea* (2000), taking different approaches to POW collaboration, aptly illustrate these lingering debates.

Another continuing controversy concerns Communist China's intervention in Korea in late 1950. The effects of China's involvement—terrible setbacks for UN troops and a rejuvenation of the war—are well documented, but culpability for Chinese intervention remains elusive. Still, MacArthur stands out as the person primarily responsible for the debacle. Early November 1950 communications between MacArthur and civilian and military authorities in Washington, as well as increased U.S. air attacks against communist targets on the Yalu River, reveal that officials in both South Korea and the United States recognized the growing possibility that China might intervene in force. Despite this evidence, MacArthur envisioned a best-case scenario regarding the size, capabilities, and intentions of the Chinese and urged Pentagon war planners to allow him to press northward. On the eve of China's massive intervention, MacArthur still believed that his envelopment of remaining communist forces would bring final victory. Clearly, the military setbacks of November and December 1950 were not MacArthur's alone; yet had the hero of Inchon urged moderation, his superiors in Washington likely would have pursued a very different course than the one they ultimately took.

Despite the disasters following China's entrance into the war, MacArthur's command survived until April 1951, when, in one of the war's most controversial moments, President Truman dismissed him. Truman stopped short of accusing MacArthur of

insubordination, but clearly, the general had shown a serious lack of regard for Washington's policies when he unilaterally issued an ultimatum to China in March 1951 and then later revealed to Congressman Joseph W. Martin (R-MA) that he opposed Truman's Eurocentric foreign policy and wanted to use Chinese nationalist forces from Formosa on the Chinese mainland to open a second front. European allies of the United States generally greeted the news of MacArthur's firing with relief, but Americans on the home front expressed outrage. Senator Robert Taft (R-OH) and other conservatives even called for impeachment. Eventually, in large part because Truman had first secured the backing of the Joint Chiefs of Staff and both Secretary of State Acheson and Secretary of Defense George C. Marshall before dismissing MacArthur, a Senate Foreign Relations Committee inquiry cleared President Truman of wrongdoing in the matter. Still, for years afterward, historians squabbled over the incident, with hard-liners and anticommunists siding with MacArthur. After the Vietnam War, however, most historians came to agree with President Truman about the dangers of widening the Korean War, and more recent works, such as Russell Buhite's *Douglas MacArthur: Statecraft and Stagecraft in America's East Asian Policy* (2008), Stanley Weintraub's *MacArthur's War: Korea and the Undoing of an American Hero* (2000), and David Halberstam's *The Coldest Winter: America and the Korean War* (2007) cast Truman's decision in a more favorable light.

Recently, controversy has centered on a group of American soldiers and their actions near the South Korean village of No Gun Ri. There, American troops allegedly massacred South Korean civilians during the early chaotic weeks of the war. Though reported at the time in major U.S. newspapers, the incident received little attention until a team of Associated Press reporters reexamined events nearly half a century later. Their 1999 investigation produced a series of articles, a Pulitzer Prize, and the publication of a book, *The Bridge at No Gun Ri*, that, like the earlier stories, alleges that U.S. forces killed some 300 civilians. Subsequent investigations conducted by both the United States and Korean authorities indicate that the massacre did take place, but they differ on the number of people killed. Thorough examination also revealed that American forces knew that North Korean troops were infiltrating the south disguised as refugees,

that the U.S. Army had asked the air force to strafe civilians headed for U.S. lines, and that the U.S. ground forces were authorized to prevent refugees from crossing through their lines. These factors, combined with the inexperience of both the officers and enlisted men at No Gun Ri, led to tragedy, the scale of which continues to be contested. A haunting reminder of some of the Korean War's darkest days, and of the underside of war itself, No Gun Ri has attracted a considerable amount of attention, but it rightly has done little to diminish the contributions of the nearly 2 million Americans who served in the theater during the Korean War.

Conclusions

After the Korean War ended in July 1953, most Americans promptly forgot about it. Unlike World War II, the little war over Korea's barren hills had required little by way of sacrifice, except for those who fought it, and seemed to have left no enduring legacies. The Korean Peninsula remained divided along the 38th parallel, just as it had been before the war and before nearly 40,000 American deaths. From the perspective of those on the home front, no great triumph had been won and no great foe had been vanquished.

Yet at the time, Korea did have a profound, if unacknowledged, impact. The first war of its kind for the United States, a limited war waged for something other than total victory, Korea signaled a shift not only in American policy but also in the American way of war. Just a few years later, in another seemingly insignificant Asian country, Vietnam, American soldiers would have cause to look back to Korea and, perhaps, to the lessons of that war. Even if limited war became the fashion of the times, however, policymakers saw the Korean War as a warning. America could never again allow itself to become so militarily unprepared. Thus, while debates over how best to secure the United States dominated much of the Cold War dialogue, presidents sought to build up American strength and credibility rather than to trim the military and the budget as Truman did. President Dwight Eisenhower focused on avoiding another Korea, stressing defense treaties and a nuclear shield, while President John F. Kennedy worked to build up conventional forces and exhibited a willingness to intervene in Third World affairs.

Certainly, the Korean War cast a much longer shadow than anyone at the time could have envisioned, and only today, more than 60 years after the war began, have Americans begun to recognize the true significance of the conflict. As North Korea, unyielding and unfriendly, continues to attempt to build a viable nuclear program, there is little doubt that a united Korea under the leadership of Kim Il Sung and his descendants would have provided an even graver danger to the West. Additionally, as a result of American and UN efforts in Korea, the once impoverished and backward nation of South Korea today stands out as a modern democracy and possesses one of the world's strongest economies. Its capital, Seoul, is characterized by modern skyscrapers and business centers. Looking at the modern world, it is impossible to deny the significance of the Korean War or of the efforts of those men and women who served there from June 25, 1950, to July 27, 1953.

KOSOVO INTERVENTION

The dissolution of Yugoslavia in the early 1990s produced five new states: (1) Slovenia, (2) Croatia, (3) Bosnia and Herzegovina, (4) Macedonia, and (5) the Federal Republic of Yugoslavia—made up of Serbia and Montenegro. Interethnic tensions in Croatia and Bosnia led these countries to civil war. As the European Community and the United Nations searched for ways to settle these wars, the Federal Republic of Yugoslavia provided military and economic support to Serb militias. This not only escalated the fighting but also created an environment where combatants, from all sides, executed military strategies that targeted civilian populations and caused severe humanitarian crises. The goal of these wars was to “cleanse” towns and neighborhoods of different ethnic groups to create ethnically homogeneous areas.

During the early 1990s, tensions were also high in Kosovo, one of Serbia's provinces, between ethnic Albanians, who comprised 90% of the province's total population, and the Serb minority, who only represented around 7% of the population. Even though leaders of Kosovo's Albanian community declared the province's independence on September 22, 1991, most countries did not recognize the territory's independence. But as the fighting in Croatia and Bosnia escalated in 1992, the United States warned Serb authorities that it would take military action if they provoked the Kosovar Albanians. Washington feared that civil war in Kosovo could spread to Macedonia, where ethnic Albanians made up 22% of the population, and entice Albania to intervene militarily in these countries to support Albanian nationalists' dreams of establishing a Greater Albania.

Roots of the Civil War

Civil war in Kosovo did not erupt for another reason. Whereas nationalist leaders in Bosnia and Croatia had decided to use force to accomplish their interests, Kosovo's most prominent leader, Ibrahim Rugova, and his Democratic League of Kosovo favored a nonviolent approach. The Kosovar Albanian community rallied behind Rugova and the Democratic League of Kosovo after the events of 1989 (when there was heightened tension between

the Serbs and Kosovar Albanians), rather than other political organizations, such as the People's Movement of Kosovo, which supported the liberation of the province via armed struggle.

While many historians have traced the roots of the conflict in Kosovo between Serbs and ethnic Albanians to the 1300s, the contemporary roots can be found in the founding of communist Yugoslavia after the Second World War. Although Yugoslavia's founder, Josip Broz Tito, promised Kosovar Albanian leaders that Kosovo would become a republic of Yugoslavia, the 1946 constitution demoted the territory to the status of a province within the Socialist Republic of Serbia, the most powerful of the country's six federal units. Tito was forced to break his promise to convince Serbs to embrace the 1946 constitution. For many Serbs, Kosovo was the cradle of their nation, home to some of the oldest and most revered Serb Orthodox monasteries and churches.

Tito's broken promise angered ethnic Albanians, and many joined armed groups, fighting for the territory's secession and eventual annexation to Albania. Even though Yugoslav forces put down these rebellions, resistance to Yugoslav and Serb authorities continued throughout the 1950s and 1960s. Although ethnic Albanians made up 68% of the population and Serbs represented 24%, Serbs controlled the province's political institutions, security forces, and state-owned industries. Higher levels of unemployment among ethnic Albanians forced many to protest Kosovo's apartheid-like system, forcing the federal authorities to address their concerns. During the late 1960s, as Croat and Slovene leaders expressed discontent with Serbs' control over the federal institutions, Tito agreed to pass a set of reforms that would decentralize power from the federal structures to the republics' institutions. To appease Kosovar Albanians, the federal government fired thousands of Serbs in various positions of power. Federal officials also allowed the creation of the University of Pristina, where Albanian became the main language of instruction. With the adoption of the 1974 constitution, Kosovo was not upgraded to republic status, but it was given representation in the federal legislature and the collective presidency, an executive body with a representative from each federal republic and autonomous province, headed by Josip Broz Tito.

While these reforms were welcomed by Kosovar Albanian leaders and derided by the Serb community, they did not calm ethnic Albanians' demands for equality at the federal level. During the early 1980s, students protested the University of Pristina's living conditions. But what started as a student protest quickly became a mass political uprising. In the streets of Kosovo's capital, Pristina, thousands of Kosovar Albanians marched and chanted phrases like "Kosovo Republic" and "Unification with Albania." A fringe element in the ethnic Albanian community also took the opportunity to call for the "cleansing" of the province, and some Albanians targeted Serbs and their cultural institutions. Due to growing interethnic tensions, federal forces entered Kosovo, suppressed the demonstrations, arrested thousands of ethnic Albanians, and purged members of the local communist party.

Although the federal authorities quickly stabilized the situation, the demands of the Kosovar Albanians angered many Serbs in the province and the Serbian authorities. This feeling was captured in a memorandum penned in 1986 by the Serbian Academy of Science and Arts, which called for the reorganization of the Yugoslav federal system to correct the Serbs' discrimination in Kosovo and other parts of Yugoslavia and to balance against rising secessionist claims. While Serb communist leaders condemned the report, the views shaped Serb public opinion. In Kosovo, leaders of the Serb community, which represented around 13% of the population, voiced their dissatisfaction with Kosovo's authority, claiming that Serbs were victims of an organized campaign of discrimination.

Slobodan Milosevic, who at the time was an influential member of the Serbian League of Communists and eventually became president of Serbia in 1989 and then of Yugoslavia in 1997, traveled to Kosovo to assess the situation. After meeting with Serb leaders, Milosevic concluded that Kosovo's autonomy status had not only violated Serbs' rights but also incubated Albanian nationalist attitudes, challenging Yugoslav values. His views forced the League of Communists of Yugoslavia to debate the province's status, triggering a wave of protests throughout Kosovo. A few months later, the Serbian government amended the republic's constitution, stripping Kosovo's autonomy and firmly placing it under Serbian rule.

On June 28, 1989, Serbs commemorated the 600th anniversary of the Battle of Kosovo. During the event, Milosevic addressed the crowd, emphasizing Kosovo's cultural importance to the Serb nation. Milosevic's speech culminated his transformation from a loyal communist leader to Serbia's first nationalist leader since the Second World War. Milosevic's rise was matched by Rugova's growing popularity. Whereas the Serb leader was a provocateur, unafraid to use force to expand his influence, Rugova proved to be a stabilizing force, convincing his followers to embrace a strategy of nonviolence.

Not all Kosovar Albanians approved of Rugova's strategy. For instance, Bujar Bukoshi, who was one of the founders of the Armed Forces of the Republic of Kosovo, argued that an armed struggle was necessary if Kosovo was to achieve its independence. While Bukoshi failed to persuade many ethnic Albanians, the Democratic League of Kosovo partnered with the group in the establishment of a parallel government, financed by the Albanian diaspora. Bukoshi's forces were integrated into the new "shadow" government as a self-defense force. Rugova's strategy was to develop the Kosovar Albanians' capacity to rule themselves. He hoped that by not engaging Serb forces, he could develop these institutions and convince the international community that ethnic Albanians were ready for statehood. Many ethnic Albanians, seeing the viciousness of the fighting in Croatia and Bosnia, were convinced that they would lose their struggle to the Yugoslav army, Serb forces, and affiliated paramilitaries. Thus, they supported Rugova's strategy, not because they believed in pacifism, but because it was the most pragmatic position.

Rugova's strategy eventually failed. While the United States and its European allies were worried about the possible outbreak of violence in Kosovo, they did not support the idea of an independent Kosovo. Instead, they saw the conflict as an internal matter. Western negotiators wanted Serbia to reinstate Kosovo's autonomy. It took time for ethnic Albanians to understand this reality, but two events made it clear that Western powers did not support their hopes for independence. The first was American negotiators' decision not to address the Kosovo conflict during the Dayton peace talks, which settled the wars in Croatia and Bosnia. The second event was the European Union's (EU's) recognition of the Federal Republic of Yugoslavia, established in 1992

as the union of Montenegro, Serbia, and the two Serb provinces of Kosovo and Vojvodina.

Although fighting between Kosovar Albanian groups and Serb forces increased after the signing of the Dayton Peace Agreements at the end of 1995, these groups did not challenge Rugova's authority. This started to change in 1997 with the growth of the Kosovo Liberation Army (KLA), an organization once designated by the Clinton administration as a terrorist body. At the beginning of 1998, the KLA had 500 active members, growing to 20,000 by mid-June 1999. The KLA's popularity increased once Serb forces reacted to its attacks on police patrols, police stations, and army bases. Planning to crush the movement, Milosevic approved a counterinsurgency strategy eerily reminiscent of the "ethnic cleansing" campaigns used by Serb militias in Croatia and Bosnia during the wars. By the end of the year, more than 40,000 Serb forces were involved in this operation. During the summer of 1998, more than 300,000 people were displaced by the fighting, setting off a humanitarian crisis.

In March 1998, the Contact Group, which included the participation of the United States, the United Kingdom, France, Russia, Italy, and Germany, started to meet regularly to discuss the crisis. Although they could not agree on a strategy to settle the conflict, they decided not to recognize Kosovo's independence. Building on the success of the Dayton peace talks, they hoped that Milosevic would be willing to work with Rugova to first reinstate Kosovo's autonomy and then to find a long-term solution to the conflict. By the end of the summer, the Contact Group, concerned by the increasing levels of violence and Serb forces' tactics, started to consider new ways to pressure Serb authorities and Kosovar leaders to end the fighting.

Outside Intervention

On September 23, 1998, the UN Security Council unanimously passed Resolution 1199 requiring all parties to the conflict to stop the fighting and maintain a cease-fire. At this time, the U.S. ambassador to Macedonia, Christopher Hill, and the U.S. envoy to the Balkans, Richard Holbrooke, met with Milosevic, Rugova, and the KLA's leaders. To support these efforts, the North Atlantic Treaty Organization (NATO) warned that it was ready to use force if the parties failed to live up to Resolution

1199's obligations. The threat of force convinced Milosevic to sign a cease-fire agreement in mid-October 1998 and to accede to the establishment of the Kosovo Verification Mission (KVM).

To verify that the parties to the conflict were complying with Resolution 1199, the KVM asked the Organization for Security and Cooperation in Europe (OSCE) to dispatch a force of 2,000 unarmed observers to establish a physical international presence in Kosovo. NATO also agreed to execute an aerial surveillance campaign. As part of this agreement, Serb leaders agreed to meet with representatives of the Kosovar Albanian community to negotiate Kosovo's political status and to allow the OSCE to organize elections for the province's new institutions. Serb authorities also consented to decrease the number of their soldiers and Ministry of the Interior units. Although Serb commanders expressed concern about the KLA, American negotiators, NATO officials, and OSCE diplomats assured them that the KVM had the resources to ensure the KLA's compliance with the agreement.

The cease-fire lasted less than 2 months. As Serb authorities pulled back their forces from Kosovo, KLA fighters took the opportunity to advance their interests. The KVM's inability to force the KLA to accept the guidelines of the cease-fire raised important questions regarding the international community's willingness to keep the peace and to resolve the crisis. In reaction, Serb forces retaliated with impunity. In early January 1999, KLA forces attacked a police station in Racak, killing four Serb policemen. Serb forces surrounded the town and prevented KVM observers from entering the town. By the end of the battle, international observers found evidence of crimes against humanity. According to a forensic investigation, Serb forces killed 45 civilians, including 3 women and 1 child. The incident was described by journalists as a massacre, and it forced the international community to reconsider the KVM's efficacy.

At the end of January, the Contact Group issued a statement supporting the terms of the original cease-fire agreement and requiring Serb and Kosovar Albanian leaders to meet international negotiators at Rambouillet, France. To support the Contact Group's efforts, NATO stated its readiness to use force to compel the parties to settle the conflict. The Rambouillet talks started on February 6 and ended on March 15. The talks were based on a set

of documents drafted by the Contact Group's representative, which were based on the principles that informed the cease-fire agreement of October 1998.

The peace talks failed because the agreement did not meet the interests of the parties. The draft agreement included two controversial provisions. For the Kosovar delegation, which was headed by Rugova but included members of the opposition parties, including Hashim Tachi of the KLA, the document did not recognize the territory's independence. Instead, it established an internationally supervised political process that would have reestablished the province's autonomy, while including a complicated process that would have enabled Kosovo to gain its independence. As for the Serbs, they could not accept a provision that gave NATO forces access to Serb territory to secure the agreement's implementation.

At the end of the process, the United States pressured the Albanian Kosovar delegation to accept the terms of the agreement, but Milosevic refused to sign the document. Nine days later, NATO fighter jets attacked Serb positions. These attacks were not sanctioned by the UN Security Council as the Russian Federation did not support NATO's actions. The aerial bombing campaign ended 77 days later after the EU and Russian special envoys negotiated a settlement based on a set of principles developed by the G-7 nations at the beginning of May. The war formally ended with the passage of UN Security Council Resolution 1244.

The air campaign against Yugoslav forces in Kosovo played a key role in forcing Milosevic to the negotiating table, and it offers one of the few examples of a victory won strictly through the use of air power. Operation Allied Force, the air operations against Yugoslav forces, commenced on March 23, 1999. Significantly, the air campaign was focused on the use of graduated pressure, with Allied forces steadily increasing the tempo and size of their attacks to achieve a political objective. This strategy flew in the face of prevailing U.S. doctrine but proved necessary as a reflection of the at times uneasy alliance of NATO forces. Initially, the multinational effort focused on attacking purely military targets, including Yugoslav air defense installations, armored vehicles, and military infrastructure. As Operation Allied Force progressed, however, Allied forces expanded their target lists to include bridges and other civilian infrastructure. This change in focus reflected the failure of initial attacks to dissuade Milosevic and

his forces from engaging in ethnic cleansing, but it also signaled the continuing development of allied strategy and the realization that attacks against fixed targets had a much higher probability of success.

In general, the air campaign was remarkably successful—the widespread use of precision munitions and careful planning limited civilian casualties and maximized the effects of the bombing. There were mistakes in the air campaign, however, most notably the destruction of the Chinese Embassy in Belgrade on May 7. Air operations continued until June 10, when observers documented the withdrawal of Yugoslav forces from Kosovo. Ultimately, it appears that Operation Allied Force played a decisive role in forcing Milosevic to the negotiating table, perhaps the only historical example of a conflict being won using air power alone.

Postconflict Resolution

Resolution 1244 required the withdrawal of all Serb forces, the deployment of a 50,000 NATO peacekeeping force in Kosovo, and the institution of a transnational civilian mission, called the United Nation Mission in Kosovo (UNMIK), directed by a special representative of the UN secretary general. It also called for the safe return of all refugees and the KLA's demilitarization. The civilian mission was divided into different pillars. Each pillar dealt with an element of the postwar stabilization effort, and each was headed by an intergovernmental organization. Early on, the UN High Commission for Refugees played an important role in peacebuilding, but over time, the EU and the OSCE have led Kosovo's political and economic liberalization.

One controversy regarding the wording of Resolution 1244 is whether it established a path toward independence for Kosovo. In November 2005, the United Nations commenced a process to investigate Kosovo's final status led by former Finnish president Marti Ahtisaari, who at the time was the UN Special Envoy for Kosovo. While his plan, the Comprehensive Proposal for the Kosovo Status Settlement, failed to get Russian approval in the UN Security Council, it established a political process for Kosovo's independence. The failure of the Ahtisaari mission did not prevent the Kosovo Assembly's unilateral declaration of independence

on February 17, 2008. To reassure the international community and to further strengthen its institutional capacity, Kosovo leaders agreed to implement the Ahtisaari plan's guidelines.

The declaration of independence worsened relations between the Serb minority in Kosovo and the province's institutions and Albanian community. The UN Security Council directed UNMIK to alter its responsibilities. Although the UN secretary general is still responsible for Kosovo's transition, the Security Council has allowed the EU's Rule of Law Mission in Kosovo to play a bigger role within UNMIK's efforts. By agreeing to follow Ahtisaari's Comprehensive Proposal, a new ad hoc organization known as the International Steering Group, composed of many states that support Kosovo's independence, was established to monitor the implementation of this plan. The International Steering Group established a new transnational civilian administration, the International Civilian Office (ICO), but not within UNMIK's authority. Coordination between UNMIK and ICO was commonplace, especially given that until April 2011 the head of the ICO was also the EU Special Representative. Cooperation between the ICO and UNMIK was hampered by the interests that inform each mission. Whereas UNMIK is a neutral interlocutor, trying to find a way of healing relations between Serbs and Kosovar Albanians and between Kosovo and Serbia, the ICO was helping Kosovo's institutions carry out a set of economic, legal, and political reforms to gain the territory's full independence.

As of September 2012, the ICO has ended its mission, declaring Kosovo's full implementation of the comprehensive proposal's provisions. UNMIK, NATO, the EU, and the OSCE still play important roles in Kosovo as Resolution 1244 is still in effect, although Kosovo's government institutions are in control over many of its functions. Kosovo's status is still a contentious issue. Although the United States and more than 90 countries, including most of the EU's members, have recognized Kosovo's independence, Serbia, Russia, and China have not. The international community's intervention in Kosovo, while ending the fighting, has not been able to address the reasons that motivated the conflict.

LANGUAGE, MILITARY

Every occupation develops its own specialized language that serves to designate people, objects, processes, and situations that are specific to the field but unfamiliar to people outside it. The military is no exception. The differences between military and civilian life create differences between military and civilian language that are remarkable in terms of their variety and scope. Military language serves many purposes: It facilitates communication in the complex, unpredictable, and emotionally stressful military environment; it reinforces social hierarchies within the service; it helps create a sense of shared identity among military personnel; it allows soldiers and sailors to describe shared experiences with specificity and detail; and it allows soldiers and sailors to clearly and directly communicate specific, and sometimes disturbing, information with a minimum of emotion. This entry discusses the key features of military language and some of the more important sources of it.

Key Features of Military Language

Military language includes a wide range of linguistic phenomena, from highly rationalized bureaucratic jargon to colorful military slang full of emotional content. The distinctive characteristics of military language tend to reflect the widely disparate communicative goals of military personnel and the wide variety of communications environments they find themselves in. *Abbreviations* and *acronyms* reflect

the need for precision and brevity in military communications; *euphemisms* and *bureaucratic jargon* often reflect the need to handle unpredictable and highly emotional situations in a routinized and unemotional manner; *slang* reflects the group identity and sense of unity shared by military personnel. In addition, the standardized procedures used in radio communications; the specialized terminology that describes tactics, techniques, and procedures; and the alphanumeric designations used for military equipment, all contribute greatly to the distinctiveness of military speech and writing.

Sources of Military Language

Acronyms like MIA, for *missing in action*, and abbreviations like *hazmat*, for *hazardous materials*, are common in military speech. Most abbreviations and acronyms are terms for frequently used words or phrases that might otherwise become unwieldy because of their length or complexity. In many cases, they serve to clarify meaning for military personnel, although they may be confusing to outsiders or newcomers. For example, terms like UA and AWOL (for *unauthorized absence* and *absent without leave*) make it clear that the absentee is not ill, not on vacation, or not on an authorized assignment, as opposed to *absent*, which is less specific.

Another source of military jargon is the bureaucratic designation for equipment. Because the military works with many kinds of specialized equipment and because military equipments are constantly being modified and replaced, systems have been developed to identify and categorize each

item, which is designated by a combination of letters and numbers depending on its intended location. For example, a TA-312 refers to a specific model of field telephone, while an F/A-18 is a specific type of jet aircraft. Although these designations may sound overly bureaucratic to civilian ears, they are quite common in military circles.

Military jargon also derives from the specialized radio and communications procedures. Because voices over radios and other communication systems can become distorted or unclear, specialized radio procedures and a specialized vocabulary have evolved to improve communications, including the International Phonetic Alphabet system (e.g., *Bravo* for the letter *b*) and specialized procedural words (e.g., *roger* for “I understand”).

Military Slang and Group Identity

Operating in tandem with these official sources of military language is the creativity displayed by individual soldiers and sailors in developing the language to describe their social reality. Slang may originate in the foreign environments in which soldiers and sailors often operate (*gung ho*) or from the strong sense of group identity that is often expressed in the nicknames service members have for themselves and members of other branches (*grunts* for infantry, *squids* for sailors, and *jarheads* for marines). Other important distinctions are often made between enlisted personnel and officers (*the brass*), frontline troops and headquarters installations (*the head shed*), and hard workers and malingerers (*sick call rangers*, *sick bay commandos*, or *clinic ninjas*). A clear picture of the operating environments military personnel find themselves in emerges from the slang that describes each new military action (the trenches of World War I were described as *funk holes*; the desert environments of Kuwait and Iraq in 2003 were described as *the sandbox*). Other terms are slight variations, often ironic, on actual words or acronyms: rear-echelon personnel on the forward operating bases of the Iraq War were described as *fobbits* in clear reference to the *hobbits* of J. R. R. Tolkien’s novel *The Hobbit*. Similarly, the American military rations called Meals Ready to Eat were given the ironic moniker *Meals Refused by Everyone* by soldiers. Another key distinction is made between friendly and enemy combatants. During times of war, names are created to

put the enemy in a negative light or to dehumanize him in order to make fighting easier. During World War II, American soldiers called their German opponents *krauts* and *jerries*. In Vietnam, American soldiers referred to their opponents as *gooks* or as *Charlie* (from *Victor Charlie*, the phonetic alphabet pronunciation of VC, for Viet Cong).

Military Influence on Civilian Language

Due to the steady flow of personnel into and out of the military, and extensive reporting from the field by the media, many words that used to be exclusively military have become a part of civilian language. Indeed, some words have become so common that their military roots have been all but forgotten—*walkie-talkie* for *hand-held radio*, or *gung ho* for being *highly motivated*.

LATINOS

The U.S. military response to the attacks of September 11, 2001, has expanded interest in the role U.S. soldiers of Latino descent have played in the U.S. armed forces. The historical record shows that Latinos, including noncitizens, took up arms in the U.S. struggle for independence, in efforts to defeat fascism and communism, and they have been playing an important role in confronting terrorism in Afghanistan and Iraq. Despite these contributions and their participation in key military conflicts that have defined U.S. history, there has been a lack of popular and scholarly attention given to their military service. This oversight has become increasingly noteworthy given how Latinos are not only the fastest growing minority group but are also enlisting in the military in larger numbers than other ethnic and racial groups.

Latino willingness to enlist in times of war, the sacrifices and heroism of noncitizen soldiers, and enduring patriotism are all factors that have defined Latinos' experience in uniform and continue to shape their experiences today. Their military record, which includes countless accommodations, including 12 Medals of Honor, has earned them a reputation for self-sacrifice, bravery, and fidelity.

Like other minority soldiers who have fought for the United States, the Latino military experience is linked to the domestic front as much as it is to the foreign. Latinos have used military service not only to defend American ideals of liberty and equality but also to confront its shortcomings. Latino veterans have relied on their exemplary military record and skills learned in uniform to confront racism, poverty, and demand civil rights. More contemporary issues like citizenship status and immigration have also become integral features of the Latino military experience. As more noncitizens take the oath and as increased federal legislation offers citizenship in exchange for military service, these issues are sure to become more prominent features of the Latino military narrative.

This entry provides a historical narrative of Latinos' prior military service, draws attention to key themes that have contextualized their service, outlines controversies that have arisen, and provides a current assessment of their military engagement.

Historical Context

U.S. military history would likely have been very different without Latino participation. Many of the heroes of these military engagements, battles that have defined the past and present of the United States, have been overlooked or ignored in the historical record.

The American War of Independence, 1775–1783, which is arguably the single most important military event in U.S. history, saw significant participation from Latinos. Spain, a nation from which Latinos trace their lineage, also committed troops, financing, and supplies. Bernardo de Galvez, a Spanish officer, worked alongside figures such as Thomas Jefferson and Patrick Henry and provided strategic planning in efforts to thwart British military advances. In commemoration of his military record and his role in helping the United States become independent, July 23, in some U.S. cities, is known as “Galvez

Day.” In 1980, marking the 200th anniversary of his victory over British troops, a postage stamp bearing his likeness was issued.

Galvez's participation in the American Revolutionary War highlighted not only what many consider to be the origins of Latino military service but also the commitment and self-sacrifice of noncitizens on behalf of the U.S. nation.

This notion was also displayed during the Texas Revolution and the Mexican-American War when Tejanos, Americans of Mexican descent, played pivotal roles in both helping Texas acquire statehood and in the United States expanding its borders from coast to coast. To cite one example, Juan Seguin, born in San Antonio when Texas was still a Mexican territory, fought alongside Anglo-Texans during the Texas Revolution. After helping Texas acquire statehood, Seguin went on to help found the Democratic Party of San Antonio and was elected mayor. Despite having his loyalties questioned because he was a Mexican by birth yet fought for the United States, Seguin remained committed to the ideas of the United States and its democratic principles.

Perhaps in no other time in U.S. history were these ideas put to test as in the Civil War. In this conflict, in which the very existence of the nation was in jeopardy, it is estimated that 2,500 Mexican Americans fought on the side of the Confederacy, and 950 joined the Union Army in Texas. By 1865, approximately 10,000 Mexican Americans were serving in regular and volunteer units on both sides. It was during this conflict that President Abraham Lincoln commissioned the Medal of Honor, the highest award for valor, given to soldiers who displayed bravery beyond the call of duty and acted in a manner that preserved life. It was during the Civil War that the first two Latinos were awarded this highest honor, and a Latino, David Farragut, rose to the rank of full admiral of the U.S. Navy.

As in previous military conflicts, the right to fight was used as an opportunity not only to demonstrate one's belief in the ideological promise of freedom and equality on which the United States was founded but to prove, via the battlefield, one's desire for full membership. Although academic studies and popular narratives and films such as 1989's *Glory* shed light on the role that African Americans played in the Civil War and how war was used to demand that the United States lives up to its cherished ideals,

Wash drawing (reverse of printed versions) shows an explosion at a British magazine during the siege of Pensacola, killing or wounding many British soldiers. In the foreground, Spanish troops, possibly under the command of Bernardo de Galvez, take advantage of the opportunity to attack and force the surrender of the British garrison.

a lot less is written about Latino contributions in the effort to preserve the country.

Geopolitical differences among competing ideologies were defining hallmarks of World War I and World War II. In these wars, fascism and later communism, especially during the Korean War, posed a monumental challenge to democracy around the world. It was in these wars that Latino military participation received more scholarly and popular attention. In addition, these conflicts most amply demonstrated the imbalance between fighting for democracy abroad while being denied civil rights at home. World War I mobilized an estimated 200,000 Latinos, who served in all branches of the armed forces.

Fighting for equality and freedom abroad did not allow Latino soldiers to escape or ignore prejudice at home. David Barkley Cantu, who dropped his mother's maiden surname and used Barkley to avoid discrimination, lost his life in battle and was posthumously awarded the Medal of Honor. Other narratives, like Marcelino Serna's, echo the continual service and sacrifice of noncitizen soldiers. Born in Mexico, Serna enlisted in the U.S. Army at the outset of World War I despite his Mexican citizenship.

Latino commitment to the principles on which the United States was founded can be seen in every war the United States has fought. Countless commendations, including the Medal of Honor, and boundless tales of heroism illustrate their loyalty and

World War II army veteran Ignacio Servin says that he volunteered for a dangerous mission to prove to his commander and fellow soldiers that Hispanics are brave and are willing to die for the United States of America. Servin attended a Pentagon ceremony honoring Hispanic World War II veterans on September 15, 2004, to kick off Hispanic American Heritage Month.

love for the United States. An undeniable parallel to this history, however, is the service by Latinos who fought on behalf of the United States without being its citizens. Guy Gabaldon was one of the 500,000 Latinos who served during World War II. Honored with the Navy Cross and a Purple Heart, Gabaldon felt obligated, in the face of increased discrimination against Mexican Americans at home, to return the medals.

Gabaldon's protest along with the case of Felix Longoria served to highlight Latino veterans' refusal to accept second-class citizenship at home while risking their lives for democracy abroad. Felix Longoria lost his life fighting in the Pacific theater. When Longoria's body was returned to the United States, draped with an American flag, a funeral home in his native Texas refused to accept the body—citing persistent anti-Mexican attitudes of the surrounding community. After a great deal of lobbying, and the intervention of future president Lyndon B. Johnson, Longoria was eventually buried with full military honors. The Felix Longoria incident was also the

catalyst in the founding of the American G.I. Forum, established in 1948, by a group dedicated to advancing the civil rights of Latino veterans.

As the United States entered Vietnam, Latinos continued to distinguish themselves in the armed forces. As in previous conflicts, Latino soldiers committed themselves to all aspects of military service. In helping stop the spread of communism in Southeast Asia, U.S. soldiers of Latino descent were awarded additional Medals of Honors, enhanced their reputation for bravery in the face of adversity, and continued to prove their admiration for the United States. They did this in the face of intense antiwar activism at home that charged that the U.S. foreign policy was increasingly relying on racial minorities to man the front lines of U.S. wars.

Current Debates and Controversies

In the U.S. involvement in Iraq in 1991, Bosnia and Herzegovina in 1992, and again in Iraq following the terrorist attacks on New York and Washington,

D.C., Latinos illustrated how critical and steadfast their participation in U.S. armed forces had become since the founding of the country. In the aftermath of Saddam Hussein's removal, as an ethnically divided Iraq teetered on the verge of civil war, Latino recruits became the most reliable pool of manpower of the United States. In the immediate aftermath of the Iraq conflict in 2003, some journalists, policymakers, and researchers estimated that Latinos constituted as much as 25% of new U.S. Marine Corps recruits. Given this increase, the theme of military service by noncitizen Latinos again emerged, just after U.S.-led forces entered Iraq, when the first U.S. casualty—a native of Guatemala who had only been in the United States for a few years prior to his military enlistment—lost his life in an attempt to neutralize the threat posed by Iraq in the Middle East.

U.S. military history, irrespective of the conflict, its ideological origins, or its popularity at home or abroad, is replete with examples of Latino heroism, love of country, and sacrifice. Their willingness to confront the contradictions of war and their demand for civil rights, all the while preserving their patriotism, make their military participation in the U.S. armed forces both unique and historical.

Today, U.S. soldiers with Spanish surnames can be found in every branch of the armed forces, especially in the U.S. Army and the U.S. Marine Corps. Recent studies and polls have shown an increase in Latino enlistment following the events of 9/11. Though it is difficult to pinpoint the exact causes of this trend, their patriotism and willingness to sacrifice for the common good has been a recurring theme of their military service. As in prior conflicts, moreover, foreign and domestic issues have intersected. Domestic debates regarding terrorism, illegal immigration, assimilation, and citizenship promise to remain linked to the discussion of Latino military service.

In addition to this, military service has facilitated the class mobility of Latino veterans. The opportunity to attend college, own a house, or acquire skill sets that are transferable to the civilian world have been made possible by government grants and initiatives aimed at improving the educational and financial needs of veterans. In this regard, discipline, teamwork, and self-sacrifice—standard mantras of military service—are coupled with skill sets such as vocational training, leadership development, and language skills that seek to give veterans a

competitive edge in the civilian world. Thus, military service has offered not only an opportunity for citizenship or full membership in American society but also a financial stake in the United States.

The notion of military service by noncitizens, a theme highlighted and rooted in Galvez's efforts in the American War of Independence, has received a great deal of attention in recent years. In 2003, President George W. Bush, as a means to acknowledge the contributions of noncitizens in uniform and to increase the pool of potential recruits, signed legislation expediting the process by which they could become full-fledged citizens. Through this process, many Latinos, already proud and patriotic, became citizens of the nation they had already committed to defend. This issue also reemerged as policymakers looked for ways to address what many considered a broken immigration system. The Dream Act, a piece of legislation that sought to provide a path to citizenship for undocumented youth who had grown up in the United States provided that they attend college or enroll in the military, reintroduced the nexus between Latino military service, domestic policy, citizenship, and civil rights.

LAWS OF WAR

The laws of war pertain to both national and international laws that dictate what constitutes a just war, what constitutes acceptable behavior in war, and the modes of prosecuting accused war criminals, as either individuals, states, or organizations. Laws of war exist as customary or codified laws, and they exist to circumscribe what weapons are allowed in combat, to define crimes against humanity, to identify protected groups such as prisoners of war (POWs) and noncombatants (particularly children), and to prevent the destruction of cultural heritage. International cooperation in determining the laws of war, as well as their codification, became a prominent issue in Europe in the late 19th century with the First Geneva and Hague Conventions in 1864 and 1899, respectively, and reached high points following the First and Second World Wars. In the later decades of the 20th century and into the 21st century, international law was expanded on a number of issues, including the Nuclear Test Ban Treaty, the banning of land mines, and the 2002 establishment of the International Criminal Court, which was monumental in establishing a permanent international institution for prosecuting war criminals. This entry discusses the evolution of international laws pertaining to wartime conduct and the prosecution of war criminals and looks at current issues.

Background

While standards of acceptable wartime conduct can be seen in texts dating back to the Hebrew Bible, ancient Greece, and the Koran, the codification of the laws of war is a relatively modern phenomenon. *Jus ad bellum* and *jus in bello* are the underlying modern standards of determining what is a war crime. *Jus ad bellum* refers to the criteria set forth

to establish whether or not a war is just, while *jus in bello* refers to the standards of behavior during wartime. Many modern conceptions of these standards arose in the mid- to late 17th century, having grown out of the constant bloodshed and the politics of Early Modern Europe that would prompt a similar change in the laws of war in the mid-20th century. The first modern conference regarding acceptable wartime behavior came in the 1856 Paris Declaration Respecting Maritime Law, signaling the start of a period of codification of the laws of war that is the basis for our understanding of them today.

Development of International Law

Most modern laws of war refer to international humanitarian law (IHL) and see their more direct origins in the early Geneva and Hague Conventions. While rules regarding *jus in bello* were more or less customary law by the time of their codification, the Geneva and Hague Conventions were the first to codify these laws as such. The foundation of the International Committee of the Red Cross by Henry Dunant in 1863 and the adoption of the Lieber Code by the Union forces of the United States during the Civil War were the first major events in the system of international conferences and conventions that constitute today's body of laws of war.

The First Geneva Convention in 1864 was directly related to the establishment of the International Committee of the Red Cross, and signatory parties recognized the neutrality of the Red Cross as an aid organization for the sick and the wounded in battle. While the First Geneva Convention provided for the treatment of combatants who had been removed from battle due to illness or injury, as well as the protection of aid workers, the Second Geneva Convention in 1906 extends all the protections of the First to combatants in a naval war.

The two Hague Conventions in 1899 and 1907 serve as the basis for the types of warfare and weaponry that are legally allowed, whereas the Geneva Conventions define legal conduct and treatment of individuals during wartime. The First Hague Convention, called in 1899 by Czar Nicholas II of Russia, established the Permanent Court of Arbitration (which seeks the pacific settlement of international disputes) and specifically banned the launching of projectiles or explosives from balloons (or, more generally, aerial bombing), hollow point

bullets, and chemical warfare. The basic principles of the First Hague Convention are still in effect today in international law.

The 1907 Hague Convention, called by President Theodore Roosevelt, expanded on the laws created during the 1899 conference but was more concerned with the laws of naval warfare than the first convention. The Second Hague Convention established laws regarding submarine contact mines, the rights of neutral powers in a naval war, and attempted to establish an International Prize Court to arbitrate property seized during wartime, though the Prize Court was never ratified.

The push for stronger international laws of war increased dramatically following the worldwide experience of horror and atrocities that came with World War I. The failure of the League of Nations is the best known example of attempts to regulate international conduct and conflict following the First World War, and it was accompanied by a number of other laws and conventions aimed at further shaping the laws of war. Many of these new laws were created in the widespread trend toward arms limitation or disarmament in the interwar period. The 1922 Washington Naval Treaty, which was signed by the United States, Japan, Great Britain, France, and Italy, instituted a building holiday on new capital vessels and set tonnage limits for battleships and aircraft carriers. Pacifism, a popular sentiment after World War I, was visible in many international efforts of the time, notably the 1928 Kellogg-Briand Pact, which outlawed war among signatory parties.

International conventions also saw the need for updates and additions following World War I. The 1925 Geneva Protocol to the Hague Convention banned all use of biological or chemical weaponry in combat, while a third Geneva Convention was called in 1929 to address shortfalls in the treatment of POWs that had not been addressed by the Hague Conventions. The Third Geneva Convention (which would be updated after the Second World War in 1949 along with the other Geneva Conventions) addressed labor performed by POWs, as well as internment of civilians.

While the post-World War I era saw diligent efforts to improve the standards of acceptable conduct during wartime, World War II presented entirely new problems to the nations involved. POWs were, in many cases, denied access to the privileges granted to them by the Geneva and the Hague Conventions

(especially those POWs held by German or Japanese forces). Atrocities against civilians were committed at unprecedented levels, resulting, in some cases, in the creation of new language to describe them. Further problems resulted from bombing of civilian centers and cultural landmarks, which took place on an enormous scale, both by Axis and Allied powers, as well as the destruction of enormous amounts of cultural heritage in the countries affected by the war.

International Law After 1945

Current international laws of war are largely a result of the postwar establishment of the United Nations and the postwar military tribunals in Nuremberg and Tokyo at the end of World War II. The 1945 UN Charter, ratified that same year, established a permanent justice organ and international court in its International Court of Justice. The most significant change to international standards following World War II came in the establishment of laws regarding crimes against humanity. In the indictment of major war criminals at Nuremberg, the three main counts presented were the waging of an aggressive war, war crimes, and for the first time in history, crimes against humanity.

In a major step for IHL, Article 6 of the Constitution of the International Military Tribunal at Nuremberg defined crimes against humanity as

murder, extermination, enslavement, deportation, and other inhumane acts committed against any civilian population, before or during the war; or persecutions on political, racial or religious grounds in execution of or in connection with any crime within the jurisdiction of the Tribunal, whether or not in violation of the domestic law of the country where perpetrated.

While the first two charges were issued in accordance with international law and treaty at the time, the addition of this article marked a change in the way the laws of war would be enforced. Nuremberg signified that national sovereignty must defer to international law in instances of crimes against humanity, but it was not without flaws. The *ex post facto* nature of the new code was used in the defense of the Nuremberg defendants, but the inherent evil in the crimes committed by the Nazi regime was felt to be in violation of customary international law,

even if it had not yet been codified as such. Furthermore, the Nuremberg Trials legally established that a “superior orders” defense (the claim that war crimes were committed based on obedient execution of superior orders) was not a viable defense in international law.

The Japanese war crimes trials presented another set of challenges to IHL and its enforcement. Accused Japanese war criminals at Tokyo and elsewhere were tried on a much smaller scale than in Germany, and the exoneration of Emperor Hirohito from responsibility for Japanese aggression has been widely criticized as a failing of postwar justice. However, the vicious war’s culmination in Hiroshima and Nagasaki generated enough controversy for many to question the legitimacy of U.S.-sanctioned justice in Japan. One of the major war crimes trials for a Japanese officer was that of the former commander of Japanese forces in the Philippines, General Tomoyuki Yamashita, who had been found responsible for war crimes committed by his men and sentenced to death by a military commission in the Philippines. After appealing his case to the U.S. Supreme Court, his conviction was narrowly upheld on the ground that as commanding officer, he should have been able to exercise control over his troops’ actions. This concept would become known as the Yamashita Precedent.

A number of new conventions on the laws of war arose after the postwar tribunals. Following the 1945 UN Charter, the United Nations subsequently established the legal definition of genocide through the adoption of the Convention on the Prevention and Punishment of the Crime of Genocide in 1948, which 142 nations have ratified thus far. In 1949, the three original Geneva Conventions were updated, and a fourth treaty was added, changing the First Geneva Convention to reflect shifting international attitudes about warfare.

Apart from the definition of and legal precedent of prosecuting crimes against humanity, World War II also gave rise to a variety of other protocols, including the Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict, the culmination of a decades-long attempt to protect European cultural heritage that began after the First World War. Laws relating to the use of certain types of weaponry were also further defined or discussed in the post-1945 era. The UN Convention on Certain Conventional Weapons, which entered into

force in 1983, later expanded bans on arms such as laser weapons, land mines, and booby traps. The 1997 Convention on Anti-Personnel Mines (Ottawa Land Mine Treaty) further restricted the use of land mines. The 1925 Geneva Protocol was also updated in 1972 and 1993 to further enhance its efficacy in modern combat. The legality of the use of nuclear weapons remains open to question. Although UN General Assembly resolutions have declared them unlawful, they have not been expressly prohibited by either treaty or legal opinion. In an advisory opinion, the International Court of Justice was divided on whether nuclear weapons could categorically be banned and whether their use could be justified by a nation in the interest of self-defense.

While international parties have worked diligently to define and promote just laws of war, the issue of prosecuting offenders has been somewhat more challenging. The International Court of Justice aims to operate as a body to settle disputes between member states, whereas the International Criminal Court (ICC), formally established in 2002 and located in The Hague, Netherlands, prosecutes war crimes, crimes against humanity, and genocide. The ICC was designed to complement national prosecution of war criminals or to take cases recommended by the UN Security Council and (as of August 2012) had recently completed its first case, that of Thomas Lubanga Dyilo of the Democratic Republic of the Congo.

Before the establishment of the ICC, however, most crimes against humanity were prosecuted through the prompting of the United Nations at ad hoc tribunals at or The Hague. The Hague witnessed several tribunals in recent decades, including the International Criminal Tribunal for the Former Yugoslavia, the International Criminal Tribunal for Rwanda, as well as courts related to Lebanon, Cambodia, and Sierra Leone. The International Criminal Tribunal for the Former Yugoslavia, established in 1993 to prosecute crimes committed since 1991, has dealt with a number of major war criminals involved in genocide, Geneva Convention violations, and crimes against humanity, including Slobodan Milosevic, Radovan Karadzic, Boris Tadic, and others. The International Criminal Tribunal for Rwanda located in Tanzania was established in 1994 to deal with those who committed the Rwandan genocide that same year, and it marked a major milestone in international law in the definition of mass rape as part of the crime of genocide.

As of July 2012, the International Criminal Tribunal for Rwanda was transferring cases to International Residual Mechanism for Criminal Tribunals in anticipation of the tribunal's completion in 2014.

Complicating the international laws of war, particularly in the United States, is the question of national sovereignty versus international law. Most nations prosecute war criminals themselves unless the cases are on an extreme scale, as in the former Yugoslavia or Rwanda. The Federal Republic of Germany held a series of trials for accused Nazi war criminals through the 1970s, and countries such as Israel held their own trials of war criminals, most notably in the Eichmann trial of the early 1960s. While the Supremacy Clause of the U.S. Constitution states that treaties are part of the "supreme law of the land," the U.S. willingness to participate in the activities or to abide by the standards of certain international bodies has been the source of some international discomfort.

In the United States

Domestically, the United States established the basic definitions of its laws of war in the 1863 Lieber Code, which was signed by President Abraham Lincoln, to dictate army conduct during the Civil War. In the modern era, the 1996 War Crimes Act (in 18 U.S.C. § 2441) of the United States defines a war crime as a "grave breach" of the Geneva Conventions, actions prohibited by the 1907 Hague Convention, the willful harm or murder of civilians with mines or other weapons prohibited by the 1996 Geneva Convention related to banned weaponry, or engaging in "prohibited conduct." Prohibited conduct is defined as torture, cruel or inhuman treatment, performing biological experiments, murder, maiming or mutilation, and intentionally causing serious bodily injury, rape, sexual assault, and the taking of hostages. War crimes resulting in the death of a victim are also punishable by the death penalty in the United States.

In the past decade, the Global War on Terrorism has created a number of questions regarding the legality of U.S. government policy, particularly as it relates to extraordinary rendition and the classification and detention of individuals deemed "unlawful combatants" by the U.S. government. The United States has declared itself exempt from compulsory jurisdiction by the International Court of Justice; that is, it only accepts rulings on a case-by-case basis,

so that many current international rulings against the United States have little actual legal recourse.

A major legal example of the issues facing the United States in this arena is *Hamdan v. Rumsfeld*, a 2006 U.S. Supreme Court case brought by the former driver of Osama bin Laden, arrested in 2004 and set to be tried before a military commission at Guantanamo Bay. The Supreme Court decision maintained that the Bush administration's military commissions at Guantanamo were illegal under international law and specifically violated the Geneva Conventions. The case sprung open a number of illegal activities being carried out by the U.S. government at home and abroad and revealed knowing, willful violations of Geneva Conventions and other international standards. While *Hamdan* resulted in an expansion of executive requests to Congress to establish military commissions (in order to establish a stronger legal footing for the commissions), it has had little practical effect on the behavior of the U.S. government in relation to enemy combatants.

Future Issues

Moving forward, the relationship of the United States to bodies of international justice will be explored further and will surely see more coverage internationally. The use of torture and other inhumane activities in the War on Terrorism is part of an ongoing debate, both domestically and abroad, and the resolution of these issues is fundamental to any ending of the conflicts involved. Internationally, the use of the relatively new ICC will be a major factor in deciding cases related to the laws of war in upcoming years, and issues over its jurisdiction in sovereign countries will further contribute to the basis of knowledge and understanding of these laws.

LEADERSHIP

Leadership in today's world matters, and it will continue to matter since we live in a world of rapidly growing volatility, uncertainty, complexity, and ambiguity (VUCA). This VUCA world is the rule that defines the context in which the military operates. In times of uncertainty and unpredictability, leadership matters even more, since it serves as an essential compass to navigate in this uncertain world, where effective maps do not exist. In this context, the U.S. military practices a unique and valuable form of leadership, built around a personal self-concept, identity perspective, and the importance and power of authentic, transformational leadership. This entry addresses the nature of military leadership and military leader qualities that have emerged to fit the VUCA operational context.

Leadership in the military, as in other organizations, matters. In the military, however, it is the “sine qua non” of military effectiveness, and creating

leaders is at the core of the military profession and one of the key points of focus for military leaders. Military leaders need to get this leadership business right since the stakes are high and the impact of getting it wrong is significant; our national security is compromised, and people are placed at risk of serious injury and even death when leadership is ineffective. The contextual considerations, the necessity for leaders to ask of followers to do something that is completely against their self-interests, to potentially die for their country, the mission, and their fellow service members, requires a distinctive form of leadership. This form is a self-concept generated sense of what it means to *be* a leader, the first of several core differentiators of military leadership.

The second differentiator is that military leadership must be authentic, transformational, and relationally driven. The military is a relational business, built around trust, where the concept of WE must be preeminent over I, since military members, when all is said and done, fight for each other. A commitment to an overriding collective purpose is the hallmark of the military and a core focus of military leadership. The final differentiator is the critical nature of a robust developmental culture that is required to produce the leaders who embrace this distinctive identity and way of being in the world and who are capable of operating effectively in a very difficult context. And, because of this context, and the culture that emerges, the military must “grow” their replacements. So military leadership and the context in which it is applied must be characterized by a very robust leader development system, essential to enabling the profession to sustain itself over time.

Military leaders must not only embrace a self-concept and master the process of transformational leadership but must also be engaged in a relentless focus on the development of other leaders as a critical and essential aspect of their professional responsibility.

The Framework

Two ways of thinking about leadership provide a useful framework for examining the core of what makes military leadership a distinctive contribution to the study of leadership. First, the act of leading is generally a function of an understanding of three variables: (1) the leader, (2) the led, and (3) the situation. In any context in which leadership occurs, these

three variables are always present and interact to define the nature of the leadership practiced, with the situational demands being most defining for the military. Thus, the foundation of effective leadership rests in three important domains: personal (the leader), relational (the led), and contextual (the situation), with the personal and contextual domains serving as the cornerstones for the framework. According to Sim Sitkin and Allan Lind, the contextual domain is characterized by two important types of leadership action: building team identity and simplifying and clarifying the complex situations, the tasks and environments, in which leadership is practiced.

In many respects, the situation, or contextual domain, dictates the type of leadership that is practiced because of how it shapes the nature of the personal (leader) and relational (the led) requirements essential for leadership effectiveness. In the military, the context is uniquely and distinctively different from all other pursuits and drives the nature of what it means to be a leader and the kind of leadership that is practiced.

The Military Context

There are several very distinct elements of the military contextual domain that the military leader must understand, simplify, and clarify for military members, and they directly affect who military leaders *are* and *how* they lead. The first, most important element is that the military's central function is preparing for and executing combat operations in fighting the nation's wars. Military leaders must lead in the most extreme conditions, entirely dependent on the willingness of members to go into harm's way whenever and wherever asked. Very few organizations require this from their leadership or sacrifice from their organizational members. According to Colonel (Ret.) Don Snider, a recognized expert in the military professions, the military service is ultimately about two things: Military members must be prepared to kill and kill when ordered, and be prepared to die and die if required to successfully complete assigned missions in service to the nation. Few organizational pursuits exact this measure of commitment and potential sacrifice from their members and leaders; it is total, absolute, and unrelenting.

Leading in combat is a specific instantiation of leading in extremis. Leading in extremis, "at the point of death," is when leaders willingly and

intentionally place themselves in circumstances of extreme danger or threat and lead others in such circumstances. This context provides individuals with purpose, motivation, and direction in the presence of physical danger and leads others in such circumstances. In the military, it is situations of extreme danger and threat that military leaders must continuously prepare for and that require a distinctive style of leadership and a unique sense of what it means to *be* a leader.

The second contextual feature of the military is that it is characterized as a *true profession*, a classification that has significant meaning and a powerful place and role in our society. As a profession, it places some unique requirements on the leaders and members of the profession and on the nature of leadership practiced, particularly in terms of the relational requirements between the leader and the society, the leader and the profession, and the leader and the led. Military leaders have a unique relationship with the society in which they serve. Military members are required to take an oath, which creates an obligation to provide to society that which it cannot provide for itself—security. This obligation is a *moral one*, to fight and die when called on by fellow citizens and, thus, creates a powerful *duty requirement* that necessitates an unlimited liability for the military member, the leader, and the leadership that is practiced.

The professional context also creates the conditions that military leaders are morally and ethically bound to a duty placing the needs of the nation and others ahead of needs to self. They are required to live in accordance with a clear set of moral obligations, and live in consonance with a specified set of ethical principles and virtues. Military leaders are required to be leaders of courage, character, and integrity. In this profession, the potential for death or injury is very real; surrounded by the demands of a professional ethic of service, military leaders must, as an organizational imperative, lead in a *values-based manner*.

The military context is also characterized by a very high degree of VUCA that places a significant amount of pressure on the military leader and the application of leadership. The "terrain" (context) in which the military is operating is continuously changing. This complexity and uncertainty will continue to place inordinate demands on the military leader, particularly for ethical and moral behavior

based on the stakes on which military leadership is exercised. For the military leader, there must be no hedging of bets—it is “all in.”

Military leaders must be compasses in a world of uncertainty, and the core of the inner workings of the compass of the military leader is a distinctive self-concept or professional identity that allows for effective navigation, even in the most uncertain terrain. This self-concept as a military leader generates an absolute commitment to the craft of leading others and to a form of leader-follower relationship that must be authentic and transformational in nature.

Personal Leadership: A Unique Self-Concept or Identity

Military leaders must have a significant measure of credibility with those they intend to lead. Warren Bennis, in his book *On Becoming a Leader*, argues that people begin to become leaders at that moment when they decide for themselves how to be. Be is what drives your response when you are asked “Who are you?” Be is what drives behavior when we are not thinking but acting under the demands of the context. Be is really about our self-concept, which is made up of identities that serve as the lenses through which we view ourselves, and provides significant influence over our behavior.

Very simply, a self-concept is an integrated system of beliefs about the self that are derived from experiences. It is a continuous process of construction, as the self-concept is continuously refined and elaborated to meet the changing demands of the organization and the environment in which it is embedded. A self-concept affects motivation, emotion, and thinking and drives our behavior in many powerful ways. It is a dynamic system consisting of personal, social, and collective identities that “come to mind” and actively influence thinking and behavior. If you want to know how a person will behave, you need to understand the person’s self-concept and the identities that form this sense of self. The most powerful identity is that which is most practiced, rehearsed, and thought about. This identity becomes salient, and “comes to mind” at any given time to drive behavior.

Leadership in the military services must be built around a distinctive self-concept. It is the core of what makes military leadership special. One of the most powerful frameworks that characterizes

this self-concept comes from the U.S. Army. Army officers practice *officership*, which a Spring 2003 United States Military Academy Officership concept paper defines as

the professional practice of being a commissioned Army leader. An essential part of officership is a shared professional identity or self-concept, shaped by what an officer must KNOW and DO, but most important, inspired by a deeply held personal understanding and internalization of what an officer must BE. This self-concept, consisting of four interrelated identities—warrior, servant of our nation, member of the army profession, and leader of character, inspires and shapes the officer’s behavior on and off-duty, 24 hours a day, 7 days a week.

This self-concept is conceived to be a powerful driver of officer behavior in all aspects of life, both on and off duty, for the officer-leader. Development of such a powerful self-concept necessitates that commissioned officers conceive of themselves in terms of four overlapping identities: warrior, servant to the nation, member of a profession, and leader of character. This is an important exemplar of this notion of a military self-concept that is very illustrative of the perspective shared by all services.

Warrior

Being a warrior is much more than merely pulling a trigger or executing combat operations. Being a warrior is really an attitude, a mind-set that guides behavior. Being a warrior means having an aggressive “fighting spirit,” associated with being a winner and winning.

A winning spirit requires a *warrior ethos*. In the recent study of the noncommissioned officers for the Army Chief of Staff (the army’s Chief Executive Officer), the study group defined the warrior ethos as compelling

soldiers to fight through all conditions to victory, no matter how long it takes and no matter how much effort is required. It is the soldier’s selfless commitment to the Nation, mission, unit and fellow soldiers. . . . The warrior ethos is grounded in refusal to accept failure. It is developed and sustained through discipline, example, commitment to Army values and pride in the Army’s heritage. (United States Military Academy Concept Paper, 2003, p. 4)

Servant of the Nation

Military leaders take an oath of service, which includes that they support and defend our Constitution. This creates a particular responsibility to live a life of duty and service. Military personnel are the ultimate American citizens, with the willingness to go into harm's way for the safety and well-being of others, the body politic. Being a servant means being dutiful. The military leader as a servant is characterized as one who understands and has a great sense of duty—to God, to country, to organization, to mission, to work, and to others—before self. As illustrated in Elbert Hubbard's great short story, a true servant to his or her nation delivers the message to Garcia.

Member of a Profession

Professions are important to our society and provide a unique service in that they do for society what society cannot do for itself. America has three military professions: army, maritime, and aerospace. The military officer is a member of a time-honored profession. This professional membership is one that is truly a “calling” that the military leader must embrace not only intellectually but also emotionally and spiritually. Brigadier General (Ret.) Malham Wakin suggests that professionals become completely and absolutely identified with their work; it becomes who they are and what they stand for. A calling demands attention 24/7 and exacts its full measure of commitment from the professional member to maintain the most expert knowledge and to organize in a self-policing, self-sustaining manner based on high standards of ethical and moral behavior.

Because of this professional membership, military leaders are given great authority and autonomy to act and direct others to act in service to the nation and, particularly, to mortal combat if required. As a result, the military leader is morally obligated to be competent in the vocation, must be adept at developing expertise in others, must set the standard for right behavior in the profession, must be a professional, and must be a person of character.

Leader of Character

Finally, military leaders must *be* leaders of character. Of all the things that they must be, this is probably the most important. Character is everything; effective leadership is the unconscious expression of

the character and personality of the leader and is the leader's identity. Character is who we are when we are not thinking about who we are. It is the essence of our behavior at the most stressful times in our lives. It is the lifelong habits that we practice, and for the military leader, these must be good habits to ensure effectiveness in the missions that these leaders will be asked to accomplish. It is ultimately what officership and military leadership is all about—it is about *being* a leader of character and a person of integrity. These identity constructs, part of a larger self-concept, generate a very unique set of relationships that create the conditions that allow subordinates to be willing to make the ultimate sacrifice to fight and die for country, for mission, and for others. The mechanism for generating these relationships is value-based, authentic leadership.

Values Matter

At the core of military leadership, across all services, are values. The values of the armed forces matter, not only based on their professional requirements and the need to wage war if asked, but also because these values can either support or subvert democratic institutions. Values are the principles that help guide our behavior. Although the services have different sets of values, they all share a common core: courage, honor, integrity, and selfless service.

Several of these values—integrity and courage, along with character (which could be considered a metavalue)—are referred to as high core values, the “highest principles.” For the military, they are the gold standard of right behavior, and they dictate the behavior required of military leaders and are the rock on which military success rests. They are nonnegotiable, apply to all, and lie at the heart of the military identity—the mechanism of the leadership compass. It is under the intense pressure associated with military leadership that these values are manifested. They are the fuel that drives the profession and the professional military ethic.

Military Leaders Must Be Authentic

Because of what military leaders are asked to do, and what they must ask their followers to do, they must be authentic. Authenticity is one of the key areas of personal leadership and is at the heart of what it means to identify oneself as a leader. Authentic leaders are genuine people who are true

to themselves—their rhetoric and their behavior match. Authentic leaders desire to serve others, and organizations, through their leadership. Authentic leaders are clearly passionate about who they are and what they are about; they practice their values as a matter of principle under all conditions, and they recognize the absolute necessity of meaningful, genuine relationships as essential to effective performance. This is clearly the mantra associated with what it means to *be* a military leader. They practice solid values, lead through their character, are extremely disciplined in the congruence of word and behavior, and recognize the importance and power of connected relationships.

The Power of Relationships

Military leaders must create powerful relationships with their subordinates, such that they will fight and die for each other. It is all about interpersonal connections. It is all about creating a sense of “We” before “I.” Military leaders must show a high level of concern, consideration, and respect for the needs of others. In other words, they must not only be personally authentic, driven by a powerful set of values, but must be transformational in their behavior and leading in a manner that shifts the relational behavior in military organizations from “I” to “We.”

Military leaders must share the same hardships as the led, set the example in all things, and demonstrate the courage to not ask subordinates to do what they are *not* willing to do themselves. In effect, they must be *transformational* in their leadership. In the psychological sense of the Gestalt, military leaders must create the conditions for “We” versus “I” in which collective activity is the figure, and all other personal, self-based considerations are the ground. Ultimately, it is the commitment to others that creates the conditions in which soldiers are willing to give their lives in service of a greater good. Military leaders understand that it is not about them, but it is about others.

Military leaders are transformational agents and do not see their subordinates as transactions. Soldiers will not give up their lives because a superior orders them to, provides rewards, or threatens with punishment; they will do so because they trust their leaders, respect their leadership, and know that their leaders truly care about them as human beings. Transformational leaders demonstrate behaviors

that create relationships and stimulate followers to go beyond expected levels of performance and to achieve true excellence. They see themselves through the lens of We and not I; place the needs of the team, the organization, and the mission first; and will sacrifice self for others. This involves the internalization of a set of values and beliefs and a way of living.

Transformational leaders generate a process where subordinates personally identify with the leader, link their sense of self to the values of the group to which they belong, and internalize the values of the leader, group, and organization and represent them as their own. These values and the identity they engender guide behavior under all conditions, particularly in the extremes of combat. This is the ultimate outcome of the military leader—to get subordinates to transcend their own self-interest and desire for self-preservation through a commitment to transformational values; to put We before I and demonstrate a willingness to give up their lives for others.

Achieving this level of value-based, identity-driven behavior is difficult and time-consuming. It cannot be purchased from outside the military but must be developed from within. Military leaders, at all levels, must be committed as an important aspect of their professional ethic, to developing others, ultimately their replacements. Thus, the military is characterized by a unique, sophisticated, and systematic leader development program embedded in a powerful developmental culture.

Developmental Culture as the Engine of Military Leadership

Effective leadership in the extreme conditions of combat is a moral imperative, and each of the armed services has a professional mandate to continuously and systematically develop its leaders over the life course of their service. Talent in the military cannot be purchased, as in many other organizational contexts—it must be grown internally. Recently, the commanding general of the army’s Training and Doctrine Command stated that if he has to prioritize all that his command is doing to enhance soldier capability, “leader development is job #1” (Dempsey, 2009). All the services have codified this development through elaborate doctrinal statements. At the core of these statements, the military services

provide powerful experiences, the appropriate education and training to maximize the benefit from these experiences, and a supportive culture that embraces development as central to organizational effectiveness and sustainment.

The leader development process of the U.S. Army is illustrative of service leadership development. It is based on the Be, Know, and Do conceptual framework initially developed by Lieutenant Colonel Boyd M. Harris in the early 1980s and first published in the 1983 version of the army's Field Manual FM 22-100, *Army Leadership*. This conceptual framework suggests that leadership at every level in the military organization (from the lowest level team leader or manager to the corporate chief executive officer) is characterized by three aspects: Who you are inside, *the Be*; what you need to know and understand about your work, *the Know*; and how you should behave, *the Do*. To develop the Be, Know, and Do, the military's leadership culture is characterized by a commitment to three core pillars of development: multiple and varied challenging and "stretching" experiences, a robust educational system across the leader's life course in the profession (the Know), and the most sophisticated training environment in the world (the Do).

Wrapped around these pillars is a focus on developing leaders of character who embrace a value-based, ethical, and moral way of living and leading, referred to as the professional military ethic (the Be). The military services have elaborate and structured performance management systems that focus on developing leader identity through an emphasis on values. At the core of this process lies an institutionalized commitment to continuous self-development. It is these commitments that make up a developmental culture that ensures that the military has leaders who Be, Know, and Do across all levels of the military organization.

The Way Ahead

America's military will continue to be challenged and to be stretched and stressed by a world that is becoming more and more complex, uncertain, and unpredictable. Trying to determine what military leaders need to know and do will be consistently problematic based on the "certainty of uncertainty" and how rapidly knowledge and skill demands will change. The military will be in a constant state of transformation, morphing to meet emerging

demands placed on it by America's evolving security landscape. The military must develop leaders who clearly understand that context matters, and this context will shape the military leader's self-concept and significantly influence the nature of the leadership that is practiced.

The only real anchor, or compass, in this volatile, uncertain, complex, and ambiguous world is the military leader, who is driven by a unique, professional identity; embraces a transformational, authentic relationship with followers; and is not only committed to continuous self-development but also willingly invests considerable time, talent, and resources to develop others, to develop his or her own replacement, and to create a culture of development. It is these characteristics that make military leadership a *distinctive* and valued contribution to the important topic of leadership.

LEAVES AND FURLOUGHs

Military leaves and furloughs are critical to the sustenance of America's fighting force during both peacetime and times of war. The health and welfare of America's military servicemen and servicewomen is a priority at all levels of command. Department of Defense (DOD) leaders recognize that it is the individual soldier, sailor, airman, and marine who fights and wins the nation's wars. The leave policies within in the Department of Defense are for the most part standardized across the services. The regulations regarding passes and furloughs are unique to specific commands within each branch of service. This entry looks at types of leaves and furloughs and their policies.

Annual Leave

Active-duty service members earn 2.5 days of annual leave for each month of service for a total of 30 days of leave per year. Service members can bank up to 75 days of leave. Any additional days above 75 that are not used are forfeited at the beginning of the fiscal year (October 1).

Special Leave Accrual

Service members serving in hostile fire or imminent danger pay areas (combat zones) for 120 days or more can accumulate up to 120 days of leave and retain it for up to 2 fiscal years. At the end of the 2 years, any amount accrued more than 75 days will be lost.

Rest and Recuperation or Environmental Morale Leave

Rest and Recuperation (R&R) or Environmental Morale Leave (EML) are programs that provide service members who are deployed for extended periods leave away from hostile fire and imminent danger areas. R&R and EML programs make use of space-available travel on military aircraft in conjunction with commercial transportation to move service members to and from combat zones. Typically, a service member who is deployed to a combat zone for 12 months will be granted 15 days of R&R or EML. Service members deployed to combat zones for periods greater than 12 months are often granted 18 to 20 days of R&R or EML.

Holidays

Active-duty service members are entitled to the same national holidays observed by those employees in the federal government. There are currently 10 recognized holidays:

1. New Year's Day, January 1
2. Birthday of Martin Luther King Jr., the third Monday in January
3. Presidents Day, the third Monday in February
4. Memorial Day, the last Monday in May
5. Independence Day, July 4
6. Labor Day, the first Monday in September
7. Columbus Day, the second Monday in October
8. Veterans Day, November 11

9. Thanksgiving Day, the fourth Thursday in November
10. Christmas Day, December 25

Training Holidays, Passes, and Liberty

Training holidays are days off that are built into a unit's training schedule. Active-duty units usually plan for one training holiday a month. If there is a national holiday in a given month that creates a 3-day weekend, commanders will often schedule a training holiday to coincide with that weekend in order to give service members a 4-day weekend. This practice creates several long weekends throughout the year in which service members are given opportunities to travel.

Pass and liberty policies are unique to individual units. Commanders establish a mileage radius around duty stations. Service members are free to travel within the established radius. The range is often 150 miles, but it is at the commander's discretion. Travels outside of the established radius for the purposes that are not official duty require leave or a pass.

Passes and liberty are granted at the commander's discretion to service members, often as a reward and incentive for outstanding performance. These are also issued to service members who sacrifice personal time due to unforeseen mission requirements. For example, if a load of equipment arrives at a port and service members must work on Saturday and Sunday to unload the equipment, they will often be issued a pass for 2 business days (Monday–Friday) during a subsequent week.

Sick Leave

Soldiers who fall ill for a short period and are expected to return to duty within 72 hours are classified as Sick-in-Quarters. During this period, the soldier may be excused from duty for treatment or medically directed self-treatment. For periods longer than 72 hours or an illness that requires hospitalization, the soldier is classified as Sick-in-Hospital. As with Sick-in-Quarters, the soldier is excused from duty during the period of hospitalization. Soldiers who are sick during periods of leave may not be charged leave for that period. Convalescent Leave is nonchargeable absence from duty granted to

expedite the soldier's return to full duty after illness, injury, or childbirth.

Terminal Leave/Unused Leave

Terminal or transition leave is a chargeable leave granted together with transition from the service, including retirement. Soldiers with a positive leave balance of 60 days or less at the time of discharge or reenlistment may be entitled to sell back leave. The leave is paid at the same rate as the soldiers' basic pay. Each day of leave is worth a day of pay. A soldier may not sell back any leave that is carried over to a new enlistment but may receive payment for any leave not carried over to a new enlistment. Unused leave may not be sold back if a soldier is discharged for the purpose of accepting a commission or a warrant in any uniformed service.

LEBANON, U.S. INTERVENTION IN (1982)

In 1982, the United States of America once again found itself committed to a military intervention to restore peace in Lebanon. The latest eruption of violence began in June when Israeli Defense Forces launched Operation Peace of Galilee, invaded Lebanon, and besieged Beirut. In July, President Ronald Reagan committed U.S. Marines in a multinational force (MNF) of roughly 2,000 peacekeepers that also included French, Italian, and English forces. In stark contrast to the 1958 U.S. intervention, the MNF found itself in an ill-defined mission, caught in the middle of a conflict that entangled Palestinians, Israeli and Syrian armies, and warring Lebanese factions. This entry discusses the challenges and events that shaped the 1982 international military intervention in Lebanon.

Intervention, Disaster, and Re-intervention

The Western intervention began in August as the siege and Israeli bombing of Beirut worsened. The U.S. special envoy and distinguished diplomat Phil Habib brokered the first failed cease-fire and remained to negotiate a second deal with the Israelis that August. The arrangement called for the MNF to bolster Lebanese Armed Forces in support of a mission to peacefully withdraw Palestine Liberation Organization militants from Beirut: their recent base for attacks against Israel. On August 25, 800 U.S. Marines joined 800 French paratroopers and 400 Italian soldiers to oversee the withdrawal and successful restoration of authority to the government of Lebanon. After the Palestine Liberation Organization militants left Beirut on September 10, the MNF redeployed to their ships, but renewed violence dashed any hopes for a short-term involvement.

Optimistic of an initial success and new solution to the Israeli-Palestinian conflict, the Reagan administration was shaken by a disaster that upended hopes for progress in Lebanon. On September 1, 1982, President Reagan announced the "Reagan Plan," which called for Palestinian self-government, under the supervision of King Hussein of Jordan, in the West Bank and Gaza. Much of the conflict and violence in Lebanon stemmed from the regional conflict that had spilled across its borders and involved numerous neighbors including Israel, Syria, Iran, and by extension the Soviet Union and the United States. While the superpowers remained largely out of the fight, securing peace in Lebanon depended on fractious regional interests. On September 14, a bomb killed Lebanon's newly elected Christian president, Bashir Gemayel, less than a month after his election and triggered a cascade into renewed violence. The next day, Israel abandoned the cease-fire and resumed its bombardment and siege of West Beirut as forces loyal to Christian Phalangist and military leader Sa'ad Haddad entered Palestinian refugee camps at Sabra and Shatila. Under the complacent watch of Israeli troops, the militias murdered nearly 800 men, women, and children no longer protected by Palestine Liberation Organization combatants or the departed MNF. The resultant outcry led to an uproar in Israel and the Reagan administration's redeployment of MNF soldiers to Beirut.

When roughly 1,600 marines rejoined the MNF in Lebanon on September 20, their mission lacked

clarity and left them in a dangerous predicament. The MNF resembled a peacekeeping force, the French considered it such, but the White House declared the marines a noncombatant neutral force—not peacekeepers. The Reagan administration further defined the marines as a deterrent to prevent violence, but rules of engagement tightly bound their own use of force outside of self-defense. In fact, they could not return fire until they identified the enemy target, and further restrictions prevented them loading their weapons without approval. Nevertheless, Reagan's administration hoped that the marine presence would help reestablish the Lebanese government's authority and speed diplomatic progress toward the withdrawal of Israeli and Syrian armies.

Deteriorating Conditions and Departure of MNF

As the intervention dragged on, little progress in Lebanon amid worsening violence exposed the complexities of the conflict and difficulties the White House faced justifying its involvement. The marines were initially welcomed by the Lebanese and conducted numerous humanitarian missions throughout the winter, but their neutral perception drastically changed during the summer of 1983. The situation in Lebanon worsened, particularly in the spring when the Reagan Plan collapsed and a terrorist bomb killed 60 people at the U.S. embassy in Beirut on April 18. As fighting swelled around the marines, the division in Reagan's cabinet between Secretary of State George Shultz and Defense Secretary Caspar Weinberger only worsened the administration's ability to respond to events and adjust policy accordingly. Vicious battles between Lebanese factions also erupted over land previously controlled by the Israel Defense Forces as Israel prepared for full-scale withdrawal in September. By mid-August, the United States made a major deviation from its plan to remain neutral in order to support the embattled Lebanese army with U.S. artillery and resupply efforts. What the administration hoped would be perceived as defensive retaliation for marine positions was instead interpreted by Lebanese militias as the MNF taking the side of Christian government forces. No longer considered neutral, the marines faced mounting casualties with outdated mission parameters in a hostile situation they were neither prepared nor permitted to take part in.

On October 23, 1983, a van loaded with the equivalent of 12,000 pounds of TNT exploded at the foot of a Beirut U.S. Marine barracks, killing 241 marines and diminishing the Reagan administration's hopes in Lebanon. Shortly after the first bombing, a similar attack struck a French base and killed 56 French soldiers. The terrorist bombs that day claimed the lives of half as many soldiers as Israel lost in its entire 16-month incursion. The United States and France retaliated against Syrian and Iranian forces after the implication of both nations' involvement, but mixed results exposed the reality that both powers could wait out the Western intervention.

In the aftermath of the bombings, the Reagan administration remained committed but the U.S. Congress proved less certain about the marines' deployment. Despite the disastrous losses, Reagan and key cabinet officials steadfastly defended the deployment as if to avoid accusations of an intention to cut and run. The bombing prompted an already impatient U.S. Congress to launch a House of Representatives Armed Services Committee investigation while the Defense Department ordered its own, chaired by retired U.S. Navy admiral Robert L. J. Long. The congressional and Long Commission investigations criticized nearly every facet of the mission, from rules of engagement to inadequate defenses and poor leadership. But most important, the commission's clarion call signaled the need for decisive political and military policy to prepare the country for future dynamic state-sponsored terrorist attacks that lay ahead.

Although the invasion of Grenada in October temporarily distracted American media and public attention, the poor conditions in Lebanon persisted. On February 7, 1984, President Reagan announced the end of the U.S. MNF deployment, and on February 26, the last remaining marines redeployed to nearby ships amid thundering U.S. naval artillery support.

LEVELS OF WAR

The levels of war are a particularly Western concept, or at least particularly the focus of Western military thinkers, and for most of Western military history until the modern age there were two levels of war: strategy and tactics. Both terms are derived from Greek words, but neither has ever achieved a universally agreed-on complete definition. In simple terms, strategy is a framework for the distribution and application of military means to fulfill the ends of policy for war. Tactics describes the activities in combat on the battlefield—the techniques used in fighting by military forces in contact with the enemy. This entry discusses the evolution of the levels of war and how their focus has changed.

Of the two initial levels, tactics was always the more concrete. In the most basic sense, tactics emerged with the realization that a group of armed combatants is more effective in combat if they are organized to work together in some fashion. As warfare grew in scale and more technologies came to be applied to war, the imperative to arrange the various arms, including artillery and cavalry, to work together in battle only grew. Tactics, whether on land or sea, required an individual or group of individuals to do the organization and arrangement of forces before and during battle, and therefore the practice of tactics was always tied to issues of leadership.

Likewise, the strategic level also required leadership, only the task for strategic leaders was always different in kind from tactics. Strategy serves policy, and therefore, a strategist must develop a clear understanding of the policy objectives for the war

and set appropriate military objectives to meet that policy, all the while accounting for available resources, tactical and technological capabilities, and enemy intentions and abilities. In premodern terms, strategy primarily concerned the thinking and processes that got armies and navies to battle and was primarily the task of the heads of the armies or navies (who were often also the heads of state).

In the modern era, especially after the American and French Revolutions, both levels underwent significant changes. Tactics still focused on the techniques for using forces in battle, but as forces grew in size, the techniques needed to grow too. The advent of large units of command, especially corps, armies, and army groups, all of which could be engaged in battle but outside the overall commander's vision and control, led to grand tactics for governing such forces. As the name implied, grand tactics were tactics on a larger scale and, thus, still focused on techniques to gain advantages in battle.

At the same time, strategy changed even more dramatically. Industrialization and nationalism allowed for the fuller mobilization of all of a society's resources to support the war. Strategy, which had been focused almost exclusively on the application of military means—armies and navies—to war, now had to account for political, diplomatic, economic, moral, and psychological means and ways. As a result, what was once just strategy became known as military strategy, and the new task of applying all of a society's resources to war took on the title grand or national strategy. Grand strategy became the responsibility of heads of state, while military strategy remained largely in the purview of generals and admirals. Due to the large size of forces and the increased scale of wars, military strategy could also be broken down into theater military strategy, the definition of ends and coordination of ways and means for a geographically distinct area, all in support of the grand and military strategies and overall policy objectives for the war.

The 20th century and the further modernization of war led to two significant changes in the levels of war. The first was the further expansion of the meaning of strategy. The mobilization requirements and pace of war created by mass industrialization led to a necessity to craft contingency military strategies in advance of the actual outbreak of war. At the same time, with civilian leaders and

academics increasingly thinking about grand strategy, strategy making became more of a peacetime activity. During the Cold War, which by its very name blurred the line between war and peace, the meaning of strategy at higher levels began to mix with policy, rather than be derived from policy. The word *strategy* in the civilian world became synonymous with planning or any kind of forward thinking and, thus, became less and less understood as the activity of defining and coordinating military ends, ways, and means for war. If there is still a strategic level of war, it now has to be understood as something very different in meaning from the so-called strategies for diplomacy, businesses, political campaigns, sporting events, economic policy, public affairs, and so on, unless those activities are part of a grand strategy in wartime.

The second change to the levels of war in the 20th century was the insertion of a third level between military strategy and tactics: operational. Again, as the scale of warfare grew, as large forces could not be destroyed in single tactical battles, the fighting season went year-round, and as strategy drifted closer to policy, it became more important to military commanders to be able to organize and coordinate potentially prolonged campaigns to meet the military strategic objectives. The operational level of war, first developed by the Germans and especially the Soviets in the interwar period, became the level at which campaigns linking strategy and tactics were planned and executed. In the 1970s and 1980s, most of the rest of the world's militaries, including the United States, added the operational level to their military thinking, replacing grand tactics.

The fluctuation in the meanings of the levels of war over the years begs the question of the utility of the categorization. But as long as humans continue to go to war, and as long as civilian public officials and military service members have the task of leading people into violent conflict, the levels of war, however artificial, provide ways of thinking and understanding the dimensions and responsibilities of command in war.

LIBERIA

Liberia is an important study in post-1989 warfare and in the history of U.S. relations with Africa. The natural resources of this heavily forested West African country—timber, gems, rubber, iron ore—are key to both U.S. involvement with Liberia and to a war that lasted almost two decades. This entry discusses the relationship between Liberia and the United States, and the war in Liberia.

Some 3.5 million people live in Liberia. The largest city is the capital, Monrovia. Liberia's government is modeled on the U.S. system: an executive headed by a president (who is also commander in chief), a bicameral legislature, and a judiciary led by a supreme court. In 2005, Liberia elected Africa's first female president, Ellen Johnson Sirleaf. English is the official language, though most Liberians speak the language of one of 16 ethnic groups.

The U.S.-Liberia Relationship

The relationship between the United States and Liberia is rooted in the 1822 resettlement of former slaves and free blacks from North America to Africa. Many Liberians today have familial and financial ties with the United States, and most Liberians regard the connection between the two as pivotal to Liberia's fate.

Throughout Liberia's history, the U.S. economic and security presence has been highly visible. U.S. companies were given wide access to Liberian resources. This included an agreement granting the Firestone rubber corporation exclusive access to 10% of Liberia's arable land for 99 years. In the Second World War, Liberia hosted U.S. bases and was the chief rubber supplier for military hardware. During the Cold War, the Liberian government allowed a Voice of America transmitter to broadcast

around Africa, and a naval monitoring station facilitated surveillance of global sea traffic. Liberia also supported the United States diplomatically, including during the Vietnam War.

Such arrangements helped Liberia's small ruling class maintain authoritarian control. U.S. advisors trained the Armed Forces of Liberia, and when the military overthrew the government in 1980, the United States continued to support the state financially and militarily. Even so, the United States largely avoided direct intervention during the two decades of instability that began in 1989.

The Liberian War

In December 1989, a group of dissidents and mercenaries invaded Liberia. The best known of the National Patriotic Front of Liberia (NPFL) rebels was its eventual leader, Charles Taylor. A former government bureaucrat and U.S. college student, Taylor was alleged at his subsequent war crimes trial to have backing from West African leaders, a network of French, American, and Lebanese businessmen, and U.S. security services. Taylor also received training in camps established by Libya's Muammar Qaddafi to further his pan-African revolution.

The NPFL was initially welcomed in northern Liberia, but its popularity was eroded by its brutality. Even without popular support, however, the group soon advanced to Monrovia. Only the intervention of a regional force led by Nigeria prevented the NPFL from seizing the capital. ECOMOG (Economic Community of West African States [ECOWAS] Monitoring Group) was the first force of its kind in Africa, though its mandate under ECOWAS defense pacts and international law was unclear. In theory, ECOMOG was to monitor a cease-fire. In practice, ECOMOG was another belligerent party, changing roles in response to shifting Nigerian interests. Much of ECOMOG's funding and logistical support came from the United States, which refused to deploy troops despite pleas from Liberia's government and civil society. Until mid-1996, the NPFL controlled much of Liberia, though ECOMOG denied Taylor a victory in the capital.

What Taylor could not do militarily, he did electorally in 1997. The NPFL won control of the legislature, and Taylor overwhelmingly won the presidency. The vote was free and fair, though fear of continued war rather than popular support was

key to Taylor's victory. The NPFL ran the government as a business enterprise. Services were nonexistent or were outsourced to private entities controlled by Taylor's associates. Paramilitaries like the Anti-Terrorist Unit operated outside the control of the defense ministry and were funded through profiteering from forest resources.

In 1999, fighting resumed with an anti-Taylor insurgency. The second phase of the war again saw dissidents, mercenaries, and business interests arrayed against the government. Liberians United for Reconciliation and Democracy (LURD) reached Monrovia by mid-2003. Again the United States refused to intervene militarily despite calls from both sides for the United States to ensure a ceasefire, sending only a small Marine Corps force to evacuate the embassy. After fighting in the capital, Taylor agreed to exile, and another Nigerian force was deployed. This was replaced in 2003 by the UN Mission in Liberia that was authorized by the UN Security Council to include 15,000 military personnel and 1,115 police officers. In November 2011, the UN Mission in Liberia maintained 7,769 military personnel, 131 military observers, and 1,283 police officers in Liberia who continued to assist in maintaining order and bolstering civil society. Postconflict, U.S. military personnel and security contractors helped restructure the state security sector.

Liberia's conflict has been called Africa's first resource war and the first postmodern war. With the fall of the Berlin Wall and the end of Cold War proxy wars, the reasons for the Liberian war were not immediately clear. The brutality of fighting, poorly trained fighters (including children), and the war's ethnic dimensions led some to conclude that a resurgent tribalism was sweeping West Africa.

In the years since Taylor's overthrow, a different conclusion about the war has circulated among scholars and policymakers. The web of business interests, political dissidents, criminal organizations, and state security services that supported various factions illustrates the importance of transnational networks hoping to profit from the natural resources in African conflict zones. For example, al Qaeda operatives were among those who trafficked in West African conflict diamonds, and transnational outfits transited both arms and drugs in exchange for timber and gems. The Liberian war now appears to have less to do with tribal hostilities than with how

violence in Africa since 1989 blurs the line between criminality and warfare, civilians and combatants, war and peace.

LIBYA

Libya is a country in North Africa bordered by the Mediterranean Sea to the north, Egypt to the east, and Tunisia and Algeria to the west. As part of the arid Maghreb region, more than 90% of Libya's 1,775,500 square kilometers (679,000 square miles) is desert. Major cities in Libya span the northern coast, including the capital in Tripoli. The majority of the 6.5 million Libyans share an Arab lineage and practice Sunni Islam. Smaller minorities include Berbers and immigrants from northern and sub-Saharan African states as well as a very small Italian population. This entry discusses the history of Libya under the regime of Muammar Qaddafi, including Libya's relationship with the United States and the international community as well as the civil war that led to his ouster in 2011.

In the spring of 2011, a civil war led by the National Transitional Council defeated the long-time government of Qaddafi, who ruled Libya since 1969. Cautious optimism about the future contrasts four decades under the turbulent rule of Colonel Qaddafi, notorious for his political vicissitude. Despite having the 10th-largest oil reserves in the world, Qaddafi squandered Libya's wealth on weapons and terrorism, grew a state bureaucracy that squelched free enterprise, and denied any hope

of true democratic privileges in a system he called direct democracy.

The Libyan Arab Jamahiriya and Qaddafi Regime

After World War II and 19 years of monarchy, Muammar Qaddafi took control of Libya in a bloodless coup d'état in 1969. Colonel Qaddafi, a military officer at the time of the coup, admired and modeled himself after the Egyptian Arab nationalist leader Gamal Abdel Nasser. Qaddafi's rhetoric originally championed Arab nationalism and the Third Universal Theory, which sought to defy the limitations of capitalism and communism. Later Qaddafi's Green Book described a system of direct democracy and popular committees that he used to shape the country, renamed the Libyan Arab Jamahiriya, in 1977. By rhetorically placing himself outside the governing committees, Qaddafi railed against the government's failures and argued for a degree of statelessness that contradicted the bureaucratic takeover of nearly every element of Libyan society.

Throughout the 1980s, Qaddafi estranged himself from the West through a foreign policy that supported contentious leaders and militant organizations around the world. These tyrants included Ugandan President Idi Amin, Liberian President Charles Taylor, Yugoslavian President Slobodan Milosevic, and Ethiopian dictator Mengistu Haile Mariam. He also spent lavishly in support of militant organizations around the world, including the Palestine Liberation Organization, Basque ETA, the Irish Liberation Army, Revolutionary United Front, Central and South American paramilitaries, and Muslim militants in South Asia. Some of these relationships also led to Libyan military operations in Egypt, Uganda, and Chad, where the Libyan military faced embarrassing and costly defeats time and again.

The defeat of Libya's Revolutionary Armed Forces in Chad exemplified Qaddafi's careful efforts to prevent professional identity and politicization of the Libyan armed forces. By 1985, Libya's military had grown to 85,000 men from a paltry 7,000 in 1969. Flush with cash from high oil prices in the 1970s and early 1980s, Qaddafi spent nearly \$3 billion annually on arms primarily supplied by the Soviet Union. The regime used weapons acquisitions to keep the military elite loyal and rotated leadership to prevent any potential uprising. Despite high spending, the armed forces intentionally remained

disorganized and ill disciplined. The regime never relied on the military for protection, so it primarily served as an outlet for employment with advancement potential greater than other government bureaucracies and government-controlled businesses. As sanctions accumulated and the Soviet Union fell, Libya's arms purchases shrank to record lows near \$10 million annually, with no purchases in 1993 or 1995.

Qaddafi's pursuit of weapons of mass destruction only worsened his reputation. In the earlier years of his rule, Qaddafi acquired and developed chemical and biological weapons. In fact, the Chadian government claimed that Qaddafi used chemical weapons including mustard gas during Libya's intervention in Chad. He did not stop with chemical weapons and continually sought expertise and components for nuclear weapons development. Qaddafi's relationship with the A. Q. Khan Network during the 1990s became a significant concern to many countries, including the United States. Eventually, his stockpiles proved to be an effective bargaining chip by the early 2000s as Libya's isolation and subsequent economic malaise grew intolerable.

To protect the Jamahiriya, Qaddafi relied on formal and informal security and justice organizations that ensured his complete control. The Intelligence Bureau of the Leader oversaw numerous security organizations that repressed dissent and doled out punishments that instilled a common fear of even uttering the leader's name. Additionally, informal groups, including the Free Unionist Officers Movement, Forum of Companions of Qaddafi, and the People's Social Leadership Committees, provided strategic links to Libya's tribes and clans that further ensured stability. Qaddafi's cunning vertical integration of the government and security apparatuses immensely helped prolong his survival and nurtured a political hopelessness among Libyans.

Qaddafi's support of militant causes and global terrorism solidified Libya's political isolation as a pariah state. Assassinations of Libyan dissidents living abroad and the 1985 attacks on the Rome and Vienna airports increased international frustration with Qaddafi's regime. On April 5, 1986, Libyan agents bombed a West Berlin nightclub popular among U.S. servicemen and worsened Libya's relationship with the United States. President Ronald Reagan publicly referred to him as "this mad dog of the Middle East." As the European Union considered sanctions, the U.S. led an air raid named Operation

El Dorado Canyon against military targets, including one of Qaddafi's residences at the Bab al-Aziziya compound. In addition to destroyed military facilities, Qaddafi's adopted daughter was killed while surface-to-air missiles shot down one F-111 fighter, killing two U.S. airmen. Qaddafi's decreased public profile demonstrated the impact of the raid in spite of international disagreement over the propriety of the operation.

Sanctions and Limited Change in Libya

The Lockerbie and French UTA flight bombings finally shifted European interests and the United Nations toward a unified policy of isolation. In December 1988, Pan Am flight 103 exploded over Lockerbie, Scotland, killing 270 people and outraging the U.S. government. Less than a year later, the bombing of the French UTA 772 airliner over Niger in September 1989 sent similar shocks through Europe. The United States had long declared Libya a state sponsor of terrorism and levied sanctions as early as 1979 only to strengthen them after the 1986 nightclub bombing. When Qaddafi refused to turn over the Lockerbie suspects or admit fault, the UN Security Council issued sanctions in 1993 that achieved a multilateral embargo with the support of Europe and neighboring Middle Eastern states. Additional measures including the Iran and Libya Sanctions Act (ILSA) pursued by U.S. president Bill Clinton's administration increased the effectiveness of the sanctions and slowed Libyan oil exports to a trickle.

The collective pressure of multiple sanctions inflicted serious economic pain on Libya throughout the 1990s. Initially, U.S. sanctions failed to significantly affect Libya as oil exports simply shifted to Europe, but the Iran and Libya Sanctions Act threatened U.S. sanctions on foreign companies that invested more than \$40 million in Libya's oil industry. Oil accounted for 95% of Libya's exports and 80% of its gross domestic product (GDP), but without foreign partners, Libya could barely operate at 1.5 million barrels a day, essentially half its previous capacity.

In the 1970s, Qaddafi used Libya's oil to provide welfare programs that subsidized housing, food, gasoline, education, and health care. The literacy rate rose from 20% to 82%, and life expectancy increased from 44 to 74 years. Additionally, the UN Human Development Index ranking and gross

domestic product per capita surpassed most African nations. Unfortunately, two decades later, critics blamed welfare excesses for the stagnant economy, with unemployment at 30% and migrant workers filling most jobs deemed undesirable. Green Book policy further squelched private enterprise, and many of the available jobs only existed in government bureaucracy, with civil service employing 20% of Libyans workers. Despite improvements in health care, malnutrition and anemia remained prevalent, and many who could afford better care traveled to neighboring countries.

Exiled from the international community and with an economy in shambles, Qaddafi shifted his tone in hopes of relief and reintegration, to find only partial success. Qaddafi attempted an Infitah economic reform in 1987 and 1990, hoping to reduce subsidies, cut government domination of the economy, and incentivize private enterprise and foreign investment. His Western-educated son Seif al-Islam also became a symbol of Western reforms that championed such measures, but neither held much promise. Qaddafi's championing of Pan-Africanism won him support from many African leaders including Nelson Mandela, who favored Libya's reintegration. An agreement to turn over Lockerbie suspects proved to be the most significant and accomplished a reduction of UN sanctions in 1999. Qaddafi finally won over the United States in 2003 when he agreed to pay Lockerbie victims \$2.7 billion and surrendered weapons of mass destruction stockpiles, including 23 tons of mustard gas and a reported 4,000 centrifuges. His support for the U.S. Global War on Terrorism and denouncement of Muslim extremism also won him praise, although U.S. President George W. Bush's administration did not remove Libya from the list of state sponsors of terror until 2006. Qaddafi appeared to return from the cold, but cynics and the future 2011 civil war proved that much of his transformation lacked sincerity.

Civil War and Future Libyan Republic

Demonstrations and protests across the Middle East during the 2011 Arab Spring eventually inspired Libyans to take to the streets as well. On February 16, frustrated Libyans massed in towns across Libya to protest the recent detention of a human rights advocate in a Day of Rage. As protests continued, riot police with tear gas and rubber bullets gave way

Muammar Qaddafi, the Libyan chief of state, attends the 12th African Union Summit in Addis Ababa, Ethiopia, February 2, 2009. Qaddafi was elected chairman of the organization.

to mercenaries and soldiers shooting and killing civilians. The unrest evoked international demands for an end to the violence backed by threats of renewed sanctions. Qaddafi attempted to cover up the unrest with footage of loyal demonstrators and manipulated body counts at hospitals. By the end of February, numerous Libyan officials and military personnel defected to a budding rebellion, including Libya's UN representatives.

In the following days, a rebel body was born and called itself the National Transitional Council (NTC). Initial committees formed behind groups of lawyers, academics, businessmen, and young Libyans who set out to manage cities and relations

with the international community. The rebel military force grew out of militias of untrained young Libyans who after the initial days of fighting were joined by Libyan military and police defectors. Some concerns arose over individuals with pro-Qaddafi pasts, but many in the NTC had government backgrounds, including NTC interim President Mustafa Mohamed Abd al-Jalil, formerly the minister of justice.

The military remained unchanged as Qaddafi kept his smaller 50,000-member army intentionally weak to prevent the possibility of a coup. When the civil war began, his best forces included four special brigades, the presidential guard, and paramilitary forces. Estimates placed foreign mercenaries, called the Islamic Pan-African Brigade, nearly 2,500 men assembled from countries throughout Northern Africa. Some African mercenaries had been migrants beholden to Qaddafi after he opened Libya to sub-Saharan immigrants and championed Pan-Africanism. His son, Khamis, controlled one of the most feared elite units, the 32nd Armored Brigade, said to number between 4,000 and 5,000 well-trained soldiers. Many loyalists from the leader's Gadhadhfa tribe filled the ranks of the air force and elite units. Nevertheless, many regular army units owed their allegiance to other tribes and served because of conscription, neither being reasons to fight for Qaddafi.

At the outbreak of the civil war, Qaddafi's unclear arms capabilities reflected the little available knowledge of actual military inventories. Since the conclusion of the arms embargo in 2004, Qaddafi purchased more than €800 million in defense equipment from Europe and an additional \$1.8 billion in arms from Russia, including attack helicopters, jets, tanks, and numerous other weapons. Rumors also suggested that he defiantly used personal funds taken from Libyan oil revenue to purchase \$1.1 billion in Belorussian arms during the embargo from 1996 to 2006. Analysts cautioned that many of these deals only existed on paper and that the majority of Qaddafi's armaments were in fact unusable and remained in storage. Chemical weapons also remained, albeit in small amounts, but they could not be used as Qaddafi no longer possessed the launching equipment. The heavy armament left with Qaddafi's forces that did not defect was soon destroyed by the North Atlantic Treaty Organization (NATO) air strikes.

Stunned by Qaddafi's violent suppression of protests, the international community moved toward sanctions in late February 2011. The U.S. president Barack Obama issued the toughest warning yet when he condemned the actions and demanded Qaddafi to step down. As Qaddafi's forces pushed back toward the rebel capital at Benghazi, Western powers began talks to establish a no-fly zone for fear of a massacre. Concerns swirled around the U.S. insistence on Arab League participation to avoid the appearance of a Western invasion. On March 17, the UN Security Council approved Resolution 1973, which gained Arab League support and allowed the United States, Great Britain, and France to intervene militarily in order to protect civilians and undermine the Qaddafi regime.

On March 19, 2011, the U.S.-led Operation Odyssey Dawn launched 110 Tomahawk missiles along with respective air strike operations by France and Great Britain. Within 1 week, the coalition established a no-fly zone that destroyed Qaddafi's air force and steadily eviscerated heavy armored units over the following weeks. The intervention routed Qaddafi's forces and saved the rebels' Benghazi stronghold, although indecisive battles continued for months. On March 31, the no-fly zone enforcement transferred from individual states to complete NATO control under Operation Unified Protector. For weeks, NATO fighter jets bombed Qaddafi's forces as European insistence on increased involvement shifted the appearance of the operation to one of close air support from the initial no-fly zone enforcement.

The guided missile destroyer USS Barry (DDG 52) launches a Tomahawk cruise missile on March 29, 2011, in the Mediterranean Sea while operating in support of Operation Odyssey Dawn. Fourteen nations have partnered to enforce UN Security Council Resolution 1973, which authorizes all necessary measures to protect Libyan civilians under threat of attack by Libyan leader Colonel Muammar Qaddafi's forces.

During the summer months, NATO air strikes increased in support of NTC forces as the NTC gained recognition from the international community. Rebel forces had struggled to consolidate gains and required heavy NATO air support to maintain their positions in the face of an aggressive pro-Qaddafi counteroffensive. NATO commanders faced criticism from rebels as they often canceled strikes to minimize civilian casualties when Qaddafi forces intentionally mixed with civilians. By July, many UN member states, including the United States, recognized the NTC as Libya's legitimate governing authority. The International Criminal Court at The Hague also issued warrants for Qaddafi, his son Seif al-Islam, and his chief of intelligence. One month later, the NTC's August draft constitution outlined a future Libyan government based on Sharia law with liberal Western provisions, including freedom of religious practice, a democratic multiparty system, and equality before the law.

In August, rebels finally captured Tripoli and raided Qaddafi's Bab al-Aziziya compound before setting out in search of him. Aided by U.S. drones and NATO air strikes, the rebels captured their former leader, who they found hiding in a drainage pipe near his home town of Sirte. Cell phone videos of Qaddafi that spread throughout Libya and the world media showed him bloodied and weak. During the initial hours of his captivity, Qaddafi died under what many considered suspicious circumstances. The international community called for an investigation, and the NTC complied but insisted he died from wounds inflicted during his capture. Qaddafi's body was quickly moved to a commercial freezer in Misrata for 4 days of public viewing prior to a secret burial. Shortly after Qaddafi's capture, the NTC declared Libya liberated and the interim prime minister Mahmoud Jibril resigned, fulfilling his promise to leave on the cessation of hostilities. His replacement, Abdurrahim al-Keib, entered office after he won an internal election with 26 out of 51 votes from members of the NTC. He planned to lead the interim government until the proposed election of a national assembly in the summer of 2012.

On October 31, 2011, NATO operations ended as the UN Security Council mandate was finally fulfilled after Qaddafi's capture. Commanders declared Operation Unified Protector a success and

noted that NATO may return under a different mandate of defense and security reform. Additionally, European and Canadian forces were commended for their successful role in leading the campaign. By October, the NATO force flew a total of 10,000 strike mission and accounted for 17 of the 18 ships that enforced the arms embargo. Unfortunately, they fell short in some areas and required a last-minute resupply of precision-guided bombs and intelligence assistance.

The U.S. role in Libya, estimated near \$1.1 billion, was billed as a success by the Obama administration, which was proud of the broad coalition and limited U.S. combat involvement. The president had pushed ahead despite an outcry in the U.S. Congress against entering a third war and threats over the legality of intervention without congressional approval. In an address to NATO, the outgoing U.S. defense secretary Robert Gates regretted that only 30% of UN members who voted on the Libyan resolution actually assisted with strike operations, mostly because they lacked the necessary military assets. He also commended the European leadership that allowed the United States to largely remain in the background for much of the campaign. In the end, the United States had launched 97% of the initial Tomahawk cruise missiles, conducted 75% of the refueling and reconnaissance missions, and provided intelligence capacity including unmanned drones.

Cautious optimism best describes predictions of Libya's future, given the enormous task of forming institutions, reining in militia forces, and jump-starting the economy. Both Qaddafi loyalists and returned moderate expatriates constitute the NTC and hope to unite the diverse tribes and interests in a new Libyan government. After the war, divisions emerged between previously united rebel militias, demonstrating the need for a succinct policy to fold rebel militias into a single national military body. Fortunately, the oil fields, left largely unscathed by fighting, reopened with the support of multinational oil companies that expect to restore and increase oil production beyond prewar levels.

LIDDELL HART, BASIL

Sir Basil Liddell Hart (1895–1970) was a 20th-century English military theorist most famous for his work on mechanization and the influence of his thought on the German and Israeli blitzkrieg doctrine. This entry examines Liddell Hart’s career and his theories.

Liddell Hart was born on October 31, 1895, in Paris. He studied history at Corpus Christi College, Cambridge, England. His studies were cut short by the First World War when he joined the British army and served on the Western Front where he was wounded twice. Like many of his generation, he was deeply affected by what he saw and did during the conflict. While in the army, he contributed to an infantry tactics manual (1920), before retiring with the rank of captain in 1927. He worked as military correspondent for *The Daily Telegraph* (1925–1935) and *The Times* (1935–1939), using his journalistic outlets as a testing ground for many of his theories. He was widely respected as an interwar theorist and served as personal adviser to the British war minister Leslie Hore-Belisha, between 1937 and 1938, proposing a series of reforms that were half implemented. Among his numerous works are *Reputations 10 Years After* (1928), *Sherman: Soldier, Realist, American* (1929), *The Defence of Britain* (1939), *The German Generals Talk* (1948), *Deterrence or Defence* (1961), and *A History of the Second World War* (1970). He also edited *The Rommel Papers* (1953). He was knighted in 1966 and died on January 29, 1970, in Buckinghamshire, England.

The Man in the Dark

One of the first theories Liddell Hart developed was the “man in the dark” theory of war. He postulated that war was like two unarmed men fighting in the dark. For one man to be successful against the other, he must first find his foe, then reconnoiter to find his weakness, fix him in position so he cannot escape, launch a decisive attack to create paralysis, and exploit his enemy’s confusion. Thus, for Liddell Hart, success boiled down to five principles: find, reconnoiter, fix, attack, and exploit.

The Expanding Torrent

The man in the dark theory was a tactical doctrine more than a strategic plan. The strategic plan to accompany the small-scale movement of the man in the dark theory was the expanding torrent. The theory was that the forward unit that makes a break in the enemy’s line will press straight ahead as long as it was backed up by the body of the army. The forward units on the flanks of the breach should follow the first unit into the breach and attack the enemy’s flanks, widening the gap. The units in the rear press

through the gap expanding to take over the frontage of the held-up units. The held-up units, after mopping up the isolated enemy still facing them, would move on to act as maneuver units for the new forward units.

These early theories, in combination, bear a striking resemblance to those of the German blitzkrieg doctrine.

The Indirect Approach

The “indirect approach” is the idea for which Liddell Hart is most famous. It consisted of two main fundamentals: first, that direct attacks against a prepared enemy never succeed and should not be attempted, and second, an enemy is defeated by upsetting his equilibrium, and this should be done before the main attack. To many, the indirect approach can be seen in action during the German campaigns of the Second World War. Liddell Hart himself claimed that Rommel’s North Africa campaign was how he envisaged his approach in action. By the time the Second World War had arrived, however, he had become pessimistic about the chance of offensive success, predicting, incorrectly, that no side could win an offensive war. When the German successes in 1939–1940 occurred, Liddell Hart was eclipsed as a theorist and spent some time in the academic wilderness.

The Second World War and Redemption

After the end of the Second World War, Liddell Hart worked hard to redeem his tarnished reputation. He revisited his earlier theories and attempted to tie them in with the German blitzkrieg that made such an impact on the landscape of war. His work with the captured German generals helped make his case in this instance. There is much controversy surrounding his influence on Heinz Guderian’s memoirs *Panzer Leader*, with some historians suggesting that he planted a paragraph to suggest that Liddell Hart had more influence on German theories than had been the case. It is a debate that will continue among students of his work for many years. However, there is no doubt that after the Second World War, Liddell Hart once again was one of the most preeminent military theorists of his age.

Nuclear Theories

In the aftermath of the Second World War, Liddell Hart was one of a number of theorists who were grappling with the significance of the new nuclear

technologies. With very little information available to him, Liddell Hart led the way in the discussion of nuclear deterrence. His work especially in *Deterrence or Defence* shaped the debate for most theorists that followed him.

Significance of His Ideas and Continued Relevance

Liddell Hart is of interest to military theorists and students of military history primarily in his historical context. His work is a product of the First World War and fed a desire to reduce the brutality and destruction of war. However, the indirect approach, although not in itself revolutionary, returned mobility to the battlefield and has provided a basis of Israeli armor doctrine since the state of Israel's creation. His contribution to German and British policies in the run up to the Second World War is both the most interesting and controversial aspect of his work, and the debate about his impact will continue for many years to come.

LITERATURE AND WAR

War literature is a prolific, broad-ranging, and popular literary genre that resists categorization. What constitutes war literature? Firsthand portrayals of battle? Literature about the aftermath of war? Arguments about the limits of the definition abound. A traditionally narrow definition of war literature requires combat as the central concern; however, a more contemporary classification includes aftermath and postwar experiences as well as the

experiences of military support staff, journalists, civilians, women, children, and members of antiwar movements. Depending on the country of service, military women's war literature ranges from the perspective of military support staff, to nurses, to soldiers. Just as men without direct combat experience write of war, so too do women. Moreover, war literature does not exist in a literary vacuum. It signifies and reflects literary movements and forms of literary expression in addition to the sociohistorical and political climates out of which it is written. War literature—novels, memoirs, short stories, poems, and plays—engage war's impact on language, culture, countries, and individuals. This entry chronologically examines the multiplicity of themes in the literature of war, focusing on the major authors, fiction, and poetry concerned with American military conflicts of the 20th and 21st centuries in addition to addressing the importance of war literature in military training and professional development and among veterans writing groups.

Because soldiers and veterans of war are the largest group to write about war, the literature typically chronicles soldiers' experiences from innocence and excitement to dissolution and cynicism. Many war narratives commence as the new recruits' military life begins, with training, then group formation and bonding. Combat ensues, often accompanied by witnessing a comrade die. Sometimes the narratives also include the homecoming experience.

World War I

The prototype of modern war, World War I began for many civilians and soldiers with excitement and innocence, attitudes that quickly turned to horror. Exposure to the mass death and overwhelming destruction of World War I shaped the writers of the Lost Generation, among them American expatriates living in Europe. As the poet Philip Larkin wrote, "Never such innocence again," so too most World War I literature reflects the loss of the youthful ideals of honor, glory, courage, and patriotism. For example, many World War I novels address the futility of war, question war's purpose, address a loss of innocence, and critique military and bureaucratic incompetence and corruption. Such novels inspired by direct experiences in the war include John Dos Passos's *Three Soldiers* (1921), e. e. cummings's *The Enormous Room* (1922), Thomas Boyd's *Through*

the Wheat (1923), Maxwell Anderson's *What Price Glory?* (1924), Lawrence Stallings's *Plumes* (1924), Ernest Hemingway's *A Farewell to Arms* (1929), Erich Maria Remarque's *All Quiet on the Western Front* (1929), William March's *Company K* (1933), and Dalton Trumbo's *Johnny Got His Gun* (1939). William Faulkner, who did not directly experience combat but served in the British air force, wrote two novels addressing the war, *Soldier's Pay* (1926) and *A Fable* (1955). Some of the most famous novels by women writers exploring the effects of the war on women include Edith Wharton's *The Marne* (1918) and *A Son at the Front* (1923), Willa Cather's *One of Ours* (1922), Gertrude Atherton's *The Living Present* (1917), Ruth Dunbar's *The Swallow* (1919), and Anne Sedgwick's *Adrienne Toner* (1921).

World War I poetry shares common themes with novels of the war: loss of innocence, wanton violence, destruction of the pastoral, mourning the death of a comrade, and reaction against myths of sacrifice. Among the many World War I poets, some of the most famous include Rupert Brooke, Joyce Kilmer, Robert Graves, Alan Seeger, and Siegfried Sassoon. Wilfred Owen's *Dulce et Decorum Est* is among the most widely anthologized and John MacRae's *In Flanders Fields* is likely the most recited, often heard during Veteran's Day services.

World War II

Despite the changes in attitudes regarding war reflected in World War I literature, World War II literature exemplifies yet another shift toward recuperation of patriotic and heroic ideals. Common elements of the World War II narrative include a group of valiant soldiers under the command of a heroic, competent leader who engage the enemy and successfully accomplish significant military objectives. Despite occasional conflict within the group and the inevitable occurrence of death, the narratives often incorporate climactic battles and successful resolutions. Some of the better known novels that fall into this category include James Michener's *Tales of the South Pacific* (1947), James Gould Cozzens's *Guard of Honor* (1948), Leon Uris's *Battle Cry* (1953), Glenn Sire's *The Deathmakers* (1960), and Alistair McLean's *The Guns of Navarone* (1957). Still, some novels, such as Herman Wouk's *The Caine Mutiny* (1951) and James Jones's *The Thin Red Line* (1962) and *From Here to Eternity* (1951)

may implicitly sanction military hierarchy, yet eschew ideals of honor.

However, World War II literature does not entirely abandon the themes raised by World War I literature. For example, Saul Bellow's *The Dangling Man* (1944) addresses the anxiety of awaiting conscription and a soldier's desire to maintain individuality, while Norman Mailer's *The Naked and the Dead* (1948) critiques military authoritarianism. Still other novels of the war build on and exceed the modernist tendencies of World War I novels and trend toward postmodern representational modes. These novels include Joseph Heller's satirical *Catch-22* (1961), a novel that emphasizes the absurdity of war, while Kurt Vonnegut's *Slaughterhouse-Five* (1969), an antiwar science fiction novel, explores senseless death and destruction. Literature of the war continues through the decades with Thomas Pynchon's *Gravity's Rainbow* (1973) and Leslie Marmon Silko's *Ceremony* (1977). Other notable novels of the war include Harry Brown's *A Walk in the Sun* (1944), John Hersey's *A Bell for Adano* (1944), Thomas Heggen's *Mr. Roberts* (1946), John Horne Burns's *The Gallery* (1947), Irwin Shaw's *The Young Lions* (1948), Elizabeth Bowen's *The Heat of the Day* (1949), Stevie Smith's postwar novel *The Holiday* (1949), and Pierre Boulle's *Le Pont de la Rivière Kwai* (1952), translated in English as *The Bridge On the River Kwai*.

Poetry of World War II departed from the heroic tradition and demonstrated determinedly antifascist and intellectual commitments. Sinclair Lewis and Edmund Wilson serve as good examples of such poets. In addition, World War II poetry underscored the bleak realities of death and loss and imagistically engaged psychological disorientation. One of the most prolific poets of the war, Randall Jarrell, wrote in a curt style that came to represent much of World War II poetry. For example, Jarrell's brief, minimalist poem *The Death of the Ball Turret Gunner* best signifies this trend. Other poets engaged in writing of desolation and machination include Richard Wilbur, W. H. Auden, Louis Simpson, James Dickey, Karl Shapiro, and John Ciardi. Civilian poets, commonly writing antiwar poems, include John Berryman, Robert Lowell, Marianne Moore, and Allen Tate.

The Holocaust

Just as World War II produced countless literary representations, so too Holocaust literature demonstrates

an array of genres, languages of origin, and publication dates. Often written by survivors of the Holocaust, or children of survivors, the literature frequently blends memoir and fiction as a new means of representing trauma. Some of the most famous works include Elie Wiesel's *Night* (1958), Imre Kertész's fictional novel *Fatelessness* (1975), Cynthia Ozick's *The Shawl* (1980), Margarite Duras's *The War* (1985), Art Spiegelman's graphic novels *Maus: A Survivor's Tale* (1986) and *Maus II: A Survivor's Tale: And Here My Trouble Began* (1991), Martin Amis's *Time's Arrow: Or the Nature of the Offense* (1991) about a German doctor at Auschwitz, Primo Levi's *Survival in Auschwitz* (1958) also known as *If This Is a Man*, Charlotte Delbo's *Auschwitz and After* (1995), and Anne Frank's *The Diary of a Young Girl* (definitive edition, 1995).

Like memoirs and fiction, poetry of the Holocaust encompasses multicultural representation. Sonia Schrieber Weitz's poetic memoir *I Promised I Would Tell* (1993) creates a hybrid exploration of genres and memory. Holocaust poetry also signifies multicultural representation. Edited by Marguerite M. Striar, *Beyond Lament: Poets of the World Bearing Witness to the Holocaust* (1998) collects poetry by survivors, witnesses, and many other poets' meditations on and remembrances of the Holocaust. Charles Fishman's edited collection *Blood to Remember: American Poets on the Holocaust* (1991) presents American poetic responses to the Holocaust.

Korean War

Compared with other 20th-century wars, many consider the Korean War a forgotten war. So the literature on the Korean War is often overlooked. However, the Korean War produced more literature than commonly realized. Typically written by veterans of the war, these novels stress authenticity, historical accuracy, and realism. The most well-known novels include James Michener's *The Bridge at Toko-ri* (1953), William Styron's *The Long March* (1952), and Richard Condon's *The Manchurian Candidate* (1959). Darkly humorous novels of the war include James Salter's *The Hunters* (1956) and Richard Hooker's *MASH* (1968) better known for its cinematic and television adaptations. Still other novels of the war include MacKinlay Kantor's *Don't Touch Me* (1951), Curt Anders's *The Price of Courage* (1957), Francis Pollini's *Night* (1960),

Herbert Fairlie Wood's *The Private War of Jacket Coates* (1966), and Michael Lynch's *An American Soldier* (1967). The following contemporary novels of the war reflect newfound interest in the war: James Hickey's *Chrysanthemum in the Snow* (1990), Chaim Potok's *I Am the Clay* (1992), Susan Choi's *The Foreign Student* (1998), Edwin Simmons's *Dog Company Six* (2000), and Ha Jin's *War Trash* (2004).

While poetry of the war seems limited, this may be a matter of exposure. W. D. Ehrhart and Philip K. Jason respond to this lack of recognition with their edited collection of Korean War poetry *Retrieving Bones: Stories and Poems of the Korean War* (1999). Some author collections of poetry include William Childress's *Burning the Years* (1971) and *Lobo* (1972), Rolando Hinojosa's *Korean Love Songs* (1978), and Keith Wilson's *Graves Registry* (1992). As the preceding lists demonstrate, literature of the war significantly declined in the 1970s and 1980s, likely because attention turned to the Vietnam War.

Vietnam War

The earliest fictional work responding to the Vietnam War demonstrates a range of themes and foci: Graham Greene's *The Quiet American* (1955) about colonialism and American involvement in the French Indochina War; Eugene Burdick and William Lederer's *The Ugly American* (1958), a highly fictionalized account of American arrogance in Vietnam; Robin Moore's *Green Berets* (1965), an enthusiastic rendering of the war and the Special Forces; and David Halberstam's *One Very Hot Day* (1967), a realist novel concerning American advisors and combat in Vietnam. Like World War I novels, the early novels of the Vietnam War also recount soldiers' experiences from innocence to disillusionment, often within the chronological time frame of a 1-year tour of duty. Tim O'Brien's *If I Die in a Combat Zone* (1973), Ron Kovic's *Born on the Fourth of July* (1976), Philip Caputo's *A Rumor of War* (1977), and Tobias Wolff's *In Pharaoh's Army* (1994) are among the most renowned personal accounts of war. Larry Heinemann's *Close Quarters* (1974), John Del Vecchio's *The 13th Valley* (1982), and James Webb's *Fields of Fire* (1978) are also distinguished novels of the war.

Literary innovation is another hallmark of Vietnam War literature. For example, Norman

Mailer's *Armies of the Night* (1968) and Michael Herr's *Dispatches* (1974) exemplify the style of New Journalism—defined by its employment of literary techniques, self-reflexivity and subjectivity. William Eastlake's *The Bamboo Bed* (1969) eschews realism in favor of complex symbolism, and Tim O'Brien's surrealist *Going After Cacciato* (1978) creates a dreamlike world of confusion, flashbacks, and symbolism within the reality of war. In addition, O'Brien's *The Things They Carried* (1990) resists generic categorization. The stories in *The Things They Carried* are linked but not necessarily interdependent. O'Brien emphasizes the importance of the text as a "work of fiction" in an informal subtitle and by creating a fictional double referred to simply as "Tim." The novel forefronts common themes among Vietnam War fiction: the relationship between truth, memory, and the limits of writing about war. Like O'Brien, Caputo, Heinemann, and others, Robert Olen Butler and Gustav Hasford wrote several novels about the war, addressing a range of experiences. Larry Heinemann's *Paco's Story* (1986), Louise Erdrich's *Love Medicine* (1984), and Bobbie Ann Mason's *In Country* (1985) address postwar social consequences.

Van Tien Dung's *Our Great Spring Victory* (1977) typifies 20th-century Vietnamese novels about the war that endorse official, sanitized representations of honor and patriotism. However, dissident voices among the Vietnamese began to appear at the end of the 20th century. Two notable novels written by veterans of the North Vietnamese army critique the war and communism: Duong Thu Huong's *Novel Without a Name* (1991) and Bao Ninh's *The Sorrow of War* (1991). The novels, like their American counterparts, portray soldiers' evolution from idealism to disillusionment.

Poetry of the war began with the antiwar movement and poems by Robert Bly, Denise Levertov, and Allen Ginsberg, many of which can be found in Robert Bly and David Ray's collection, *A Poetry Reading Against the Vietnam War* (1966). With several collections each, the most prolific Vietnam veteran poets include John Balaban, W. D. Ehrhart, Yusef Komunyakaa, Walter McDonald, and Bruce Weigl. Poems by these authors, and many others, appear in the following anthologies: Larry Rottman, Jan Barry, and Basil T. Paquet's *Winning Hearts and Minds* (1972), Jan Barry and W. D. Ehrhart's *Demilitarized Zones* (1976), W. D. Ehrhart's

Carrying the Darkness (1985 and 1989), and Ehrhart's *Unaccustomed Mercy* (1989).

Persian Gulf War

The short-lived Persian Gulf War produced some literature, among which Anthony Swofford's *Jarhead: A Marine's Chronicle of the Persian Gulf War and Other Battles* (2003) is the most famous, likely because—like many World War II and Vietnam War novels—it was the basis of a Hollywood film. Joel Turnipseed's *Baghdad Express* (2003) is another notable memoir of the war. Fiction accounts of the war include James Chapman's *Glass: Pray the Electrons Back to Sand* (1994); Charles Sheehan-Miles's *Prayer at Rumayla: A Novel of the Gulf War* (2001), which encompasses the homecoming experience; Gabe Hudson's collection of stories *Dear Mr. President* (2002); James Blinn's *The Aardvark Is Ready for War* (2003); Tom Paine's *Pearl of Kuwait* (2003), wherein one of the two main characters is a Vietnamese American soldier; Andrew Huebner's *We Pierce* (2004); Kim Ponders's *Uncontrolled Flight* (2005) about a female combat pilot; and Neil MacFarquhar's *The Sand Café* (2006), a black comedy about embedded journalists. Interestingly, the vestiges of the Vietnam War appear in most of these Gulf War texts whose authors or characters have parents from the Vietnam generation. Poetry about the war is scarcer than fictional accounts; however, there are a few collections such as Tamar Segal's *War in the Gulf: A Diary in Poetry* (1991), Jay Meek and F. D. Reeve's *After the Storm: Poems on the Persian Gulf War* (1992), and William J. Simmons's *The Gulf War Anthology of Poetry* (1996).

Iraq and Afghanistan Wars

In the 21st century, memoirs about the wars in Afghanistan and Iraq frequently began as soldiers' blogs, for example, Colby Buzzell's *My War: Killing Time in Iraq* (2005) and Matt Gallagher's *Kaboom: Embracing the Suck in a Savage Little War* (2010). Memoir is the most common early form of Afghanistan and Iraq War literature. Often focusing on realist reportage rather than innovative literary interpretation of the war, these memoirs address political complications, successes and failures of technology, and counterinsurgency policies. The Arabic linguist and Iraq War veteran Kayla Williams's *Love My Rifle More Than You* (2005) focuses on the

sexual harassment women endure in the military and her Iraq War veteran husband's dreadful experiences with veteran's hospitals. Nathaniel C. Fick's *One Bullet Away* (2005) about military training, Afghanistan, and the 2003 invasion of Iraq provides a more positive, if suppressed, portrayal of soldiers in war as kind and generous. Donovan Campbell's *Joker One: A Marine Platoon's Story of Courage, Leadership, and Brotherhood* (2009) depicts combat in Ramadi, Iraq, and the insufficiencies of training and equipment. Craig M. Mullaney's *The Unforgiving Minute: A Soldier's Education* (2009) incorporates military academy education, combat in Afghanistan, and inner reflection.

However, National Guard veteran John Crawford's *The Last True Story I'll Ever Tell: An Accidental Soldier's Account of the War in Iraq* (2005), a compilation of stories that avoids chronological order, imaginatively blurs the line between memoir and fiction. Another National Guard veteran, Tom Young, created a fictional novel, *The Mullah's Storm* (2010), that proffers an imaginative survival story about a transport plane being shot down in Afghanistan's rugged, enemy terrain. Young's female character, an army interpreter, is of particular note. Poetry about the wars in Afghanistan and Iraq, including antiwar poetry, continues to permeate the Internet; however, traditional publications remain rare. Two collections written by war veterans address the war in Iraq: Brian Turner's *Here Bullet* (2005) and Gregory Robert Samuels's *War Poems From Iraq* (2006).

While common themes, especially the transformation of soldiers from innocence to experience, appear across the literature of war, many literary critics contend that sentiments of heroism, sacrifice, purpose, valor, and heroism have declined in war literature throughout the 20th and 21st centuries. Although this is generally true, these portrayals reappear throughout the decades.

War Literature in Military Training and Professional Development

War literature also plays a noteworthy role in the training and ongoing professional development of military personnel. Divided by rank, from privates to generals, the U.S. Army and Center for Military History provides a military professional development reading list as does the Marines Reading Program.

The Combined Arms Research library at the U.S. Army Combined Arms Center contains several types of reading lists under such categories as "Military Deployment." The U.S. Army War College library creates an annual reading list of distinguished recent publications. These lists not only tend to emphasize military history and military and strategic theory but also include memoirs and some fiction. For example, nearly every list included Michael Shaara's fictional novel, *The Killer Angels* (1974), about the battle at Gettysburg; James Webb's Vietnam War memoir, *Fields of Fire* (1979); and another memoir of that war, Harold G. Moore and Joseph L. Galloway's *We Were Soldiers Once . . . and Young* (1992). Recommended and required reading lists aim to create common ground among military personnel, to encourage intellectual reflection, to promote an appreciation for military heritage, to emphasize lessons learned, to facilitate professional development, and to help those who will and have engaged in war understand the human element of war.

English departments at military academies, institutes, and colleges, such as West Point, the Citadel, and Virginia Military Institute, offer war literature courses. These courses explore a range of themes—fear, courage, heroism, comradeship—often include historical and cultural contexts, emphasize aesthetic representation, unavoidably encounter moral and ethical issues, and typically examine film in addition to classic and contemporary literature. Elizabeth Samet's *Soldier's Heart: Reading Literature Through Peace and War at West Point* (2007) provides a civilian's perspective on the relationship between war, literature, and the military professional's training, career, and life.

Veterans and War Literature

Bearing witness to trauma is a traditional healing method, and writing continues to evolve through formal and informal treatment methods for combat-related posttraumatic stress disorder. Among military veterans, reading and writing war literature serves as a means of helping them articulate their experiences and, thereby, make sense of war's contradictions and traumas. Veterans' writing programs began as a mode of coping with trauma and as a means of healing emotional wounds through artistic expression. Writing programs aim to create social cohesion both among veterans and between veterans

and the broader society. Thus, veterans' writing programs often form a basis in outreach and reintegration efforts. Most veterans writing programs share the aim of helping veterans process their war experiences through artistic expression.

For example, during World War I, some doctors at Craiglockhart War Hospital near Edinburgh prescribed patients to engage in artistic expression, particularly metric poetry, in an effort to reorient the patients to temporality and to aid them in ordering the chaos of trauma. This therapy resulted in *The Hydra*, a literary and artistic journal that collected the artistic expressions of recovering soldiers. In addition, the 1970s and 1980s saw Vietnam veteran "rap groups" attended by volunteer therapists often resulting in veterans writing groups.

One of the most enduring writing programs, the Hospitalized Veterans Writing Project, is a therapeutic writing program founded as an outreach program for World War II veterans in 1946 and is now a component of the Department of Veterans Affairs medical center recreation and rehabilitation services. Three times each year, the Hospitalized Veterans Writing Project publishes a literary magazine, *Veterans Voices*.

Some veterans writing groups ascribe to shared philosophies, such as pacifism. In 1988, Kali Tal founded the Viet Nam Generation, an educational organization that published the *Viet Nam Generation Journal*. Tal served as editor and writing coach for Vietnam veteran writers and founded Burning Cities Press in 1990 to publish the work of combat veterans who became involved in the peace movement. A unique group formed in 1993 when the novelist Maxine Hong Kingston began leading writing and meditation workshops for veterans and their families; the quarterly meetings resulted in a community of writers informally named Veterans Writers Group and in an anthology edited by Kingston, *Veterans of War, Veterans of Peace* (2007).

In 2004, the National Endowment for the Arts created one of the most expansive national writing projects, Operation Homecoming, in response to the wars in Iraq and Afghanistan. The project consists of writing workshops for military personnel and their families held at U.S. military installations in the United States and abroad as well as at Department of Veterans Affairs' medical centers and hospitals. The project resulted in an anthology, *Operation Homecoming: Iraq, Afghanistan, and the*

Home Front in the Words of U.S. Troops and Their Families (2006) and in an expanded edition in 2008. Archives are available in the U.S. National Archives and Records Administration and the Library of Congress Veterans History Project.

Another veterans writing project created in response to the Global War on Terrorism, the Warrior Writers Project, aims to build creative communities for veterans and promotes the transformative potential of creative expression. The Warrior Writers Project workshops resulted in two books, *Move, Shoot and Communicate* (2007) and *Re-Making Sense* (2008).

The William Joiner Center for the Study of War and Social Consequences at the University of Massachusetts in Boston began holding annual writers workshops in 1988 that required an application and tuition fee. Military veterans make up the faculty leading the 2-week workshops that consist of classes, discussions, panels, readings, and exhibits. Other colleges and universities engage in short- and long-term programs; some require tuition and others are free. For example, the New York University Writing Program offers free, nonpartisan, writing workshops for Iraq War veterans. The Writers Guild of America also hosts writing workshops at state universities. As veterans groups grow on campuses, an increase in writers groups will likely follow.

LOCKHEED MARTIN

Lockheed Martin, a major U.S. aerospace and defense technology corporation, is the product of a merger between Lockheed Corporation and Martin Marietta in 1994 and is one of the largest defense contractors in the world. Lockheed Martin is headquartered in Bethesda, Maryland, and its current chief executive officer is Robert J. Stevens. Lockheed is the largest government contractor in the country, having reported \$46.5 billion in revenue in 2011. Most of that revenue (82%) came from contracts with the U.S. government, with 61% from the Department of Defense alone. In 2011, Lockheed Martin spent about \$15 million in lobbying expenditures at the federal level. This entry examines the history of Lockheed Martin military aircraft, missile systems, and other programs and discusses Lockheed's changing role in the global market.

History

Both the Lockheed and Martin corporations were founded in 1912, and both were historically responsible for a number of notable defense and aerospace projects throughout the past century, including planes such as the B-26 bomber, the Space Race-era Titan rocket program, the SR-71 Blackbird, the Manned Maneuvering Unit, and the ill-fated Mars Climate Rover (which failed on landing in 1998 due to Lockheed's use of American measurement units instead of the metric units specified by the National Aeronautics and Space Administration). Lockheed Martin was also heavily involved in contracting for the space shuttle program throughout its existence at National Aeronautics and Space Administration.

The Contemporary Era

Currently, the major profit-generating products from Lockheed are defense systems, electronic systems, cyber security, and weaponry, while the company's

Space Systems division has suffered from a drastic loss of product sales. Lockheed's most profitable programs include the F-35, F-16, tactical missile programs such as the Hellfire, the Multiple Launch Rocket System (MLRS), the Joint Air-to-Surface Standoff Missile, and electronics and cyber security systems. An increasingly large portion of Lockheed's service sales now come from the Electronic Systems division.

One of Lockheed's major recent programs is the F-35 Lightning II, one of the world's most highly advanced fighter planes. The F-35 was conceived in the mid-1990s and was part of a multinational project that included the United States, Great Britain, Australia, and a number of other North Atlantic Treaty Organization countries and U.S. allies. The F-35 now also has two international customers, the Japanese and Israeli air forces, and the United States government alone has ordered more than 2,000 F-35s, with deliveries beginning in mid-2012. The project was planned to replace the less effective and less versatile F-22 fighter but has not been without its share of controversy, with the current price of the aircraft double the initial planned price in 2001 and a number of recent technical glitches requiring more federal money to solve. The F-35 was a significant factor in Lockheed's net aeronautics sales of \$14.4 billion in 2011.

Recently, Lockheed Martin successfully launched a Next Generation Identification System for the Federal Bureau of Investigation, the Space Based Infrared System (which provides a defense system in case of missile attack), GPS technology for the Federal Aviation Administration, the Juno spacecraft sent to Jupiter, the GRAIL spacecraft sent to the moon, and the Persistent Threat Detection System and K-MAX unmanned cargo aircraft system, both currently in use in coalition operations in Afghanistan.

Lockheed Martin is presently pursuing a number of ongoing projects, including the Squad Mission Support System, the largest unmanned vehicle ever deployed with the U.S. ground forces, which will aid supply lines and the evacuation of casualties. In early 2012, Sandia Laboratories, a subsidiary of Lockheed Martin, announced the development of a self-guided bullet, and Lockheed announced the creation of HULC (human universal load carrier), an anthropomorphic exoskeleton that will enable soldiers to carry heavy combat loads with no adverse effect on mobility. The company's Orion project is

currently designing the nation's first interplanetary manned vehicle, with the stated goal of Orion eventually being capable of taking humans to Mars.

Perhaps the biggest issue facing Lockheed Martin at present is possible sequestration due to federal budgetary concerns. With about \$487 billion cuts to U.S. defense spending set to take place over the next decade, the company has had to make cuts in certain divisions, such as Space Systems, but may still face major layoffs when the spending cuts take place. The chief executive officer of Lockheed Martin, Robert J. Stevens, said in June 2012 that the defense cuts and subsequent cuts in government contracts for the company would likely force Lockheed to undergo severe cuts to its 123,000-person workforce.

According to the company's 2011 annual report, while programs such as the Global Positioning Satellite program, the Phased Adaptive Approach Missile Defense System, and the U-2 manned aircraft program will all continue to operate, the company will need to expand its products and services in order to maintain or grow its share of the market. With this reduction in U.S. government funds in mind, Lockheed is dedicated to pursuing a more global market for its products in the near future. In 2011, the company billed \$916 million in receivables to foreign entities.

Lockheed Martin continues to develop cutting-edge technology and weaponry for the U.S. government in a number of fields, and not just those related to defense. With the ending of U.S. military operations in Iraq in 2011, the ending of the space shuttle program that same year, and full economic recovery still on the far horizon, Lockheed is currently engaged in a reshaping of parts of its business plan to reflect the changing nature of its relationship with the U.S. government and other world governments. Lockheed's changing role in developing weapons and systems, not just for the United States but for foreign governments as well, will create an interesting set of issues for the U.S. government as military contractors face the threat of budgetary cuts. Lockheed's relationship with not just the Department of Defense but with the U.S. government as a whole will doubtlessly be affected by the coming months and years of budgetary debate and Lockheed's willingness to work with foreign governments to secure other contracts.

LOGISTICS

Human nature and history are filled with many concepts of duality. Within the construct of war, there is perhaps no better reflection of this duality than the relationship between logistics and operations. The *Doctrine for Logistics Support of Joint Operations* (DOD Joint Publication 4.0) states that "Operations and logistics are inseparable facets of war. Although logistics plans are derived from operational goals, neither can claim primacy" (Department of Defense, 1992, p. 11).

For military purposes, a workable aggregate definition of logistics based on current doctrine could be specified as

the science and art of planning and conducting the movement, support, and servicing of forces to include those aspects of military operations that deal with the design and development, acquisition or construction, storage, movement, distribution, evacuation, maintenance, hospitalization and disposition of material, personnel, and facilities for the purposes of generating combat power (the total

means of destructive, constructive, and information capabilities that a military unit or formation can apply at a given time) and extending operational reach (the distance and duration across which a unit can successfully employ military capabilities) across time and distance to achieve military objectives.

It is the significance of generating combat power and extending operational reach that connects logistics with operations and forms the basis for an evolution of logistical models and strategies from ancient warfare to contemporary conflicts. Throughout this evolution, principles of military logistics have been codified covering the strategic, operational, and tactical levels of war. Future logistical problems will be met with 21st-century solutions to ever increase the readiness and reach of operational forces.

With the emergence of organized societies, the concept of war and the associated need for military logistics emerged. The rise of standing armies to defend empires and add to them through conquest required housing, equipping, and supplying military forces on a continual basis. For the sake of simplicity, the history of military logistics is divided into three periods—ancient, modern, and postmodern—and two systems: garrison (or fixed facilities) and field.

Logistics in Ancient Times

From the time of the Sumerians of Mesopotamia (ca. 3500 BCE) through 16th-century Europe, the tried-and-true logistical methods of supplying an army were requisitioning (contracting), foraging, and pillaging. Early empires and city-states maintained a small number of standing, professional soldiers backed by a semitrained portion of the population ranging from 1% to 10%. By contracting with commercial enterprises, the state ensured that the standing force was maintained and that the armaments were stored, so that the size of the army could be expanded when necessary. Requisitioning was also used when a mobile army passed through the territory of an ally or a recently conquered foe. Payment on receipt or a promise to pay later placated most hostile feelings. On marches outside friendly lands, an army on the move foraged from wild resources or pillaged those of its enemy.

The success or failure of these campaigns depended on the skill of the leaders in organizing the procurement of supplies by coin or sword. The size

of armies in garrison was dictated more by internal societal structure than by logistical requirements; there are accounts of some empires maintaining armies with a total strength of 250,000 or more. However, the size of ancient armies was relatively small when in the field, since living off the land (or your enemy) meant a limited area to pillage and required movement once the resources of an area were consumed. History records few field armies during this period exceeding 50,000 men.

Though the majority of an army's supplies were requisitioned or pillaged, there were accompanying wagons and baggage trains that carried some food and other items. Many early baggage trains supported the army's noble members and consisted of servants and the finer items necessary for a comfortable stay in the field. Technological advances such as chariots, siege engines, and various mechanical means of launching missiles (arrows, stones, etc.) required attending craftsmen to build or maintain these weapons. Wagons holding tools and supplies made up another fraction of the overall baggage train.

Horses represented one of the most important logistical elements. Whereas a man might require a combined weight of 10 pounds of food and water per day, a horse required 10 times as much fodder given its role as a beast of burden. It is easy to see why ancient armies had to keep moving and why their operational reach was limited by the quantity of supplies that could be acquired in the countryside through which they passed.

There were some notable exceptions to this process, mainly developed by imaginative and ingenious leaders. Alexander the Great is perhaps the best example. His first innovation was to reduce the size of his accompanying baggage train by shifting some of the burden to the backs of his men; the average Macedonian soldier carried 60 pounds. Alexander also made excellent use of naval transport to move supplies from captured territory forward into newly conquered lands. While this provided only a fraction of the overall supplies his army required, it did give him an advantage his enemies usually did not possess.

Modern Logistics

The transition to modern logistics began in the early 17th century. What sets the modern era apart from its ancient predecessor is the trend toward increasingly large field armies and the corresponding

complexity of the logistics systems required to support them. Societal reasons for this phenomenon aside, during the late 1500s field armies numbered between 15,000 and 40,000 troops, whereas less than 50 years later, Swedish king Gustavus Adolphus would take to the field in present-day Germany with an army in excess of 100,000 men. Three hundred years later, army groups with strengths greater than 500,000 men clashed on the European plains. This era also saw the transition to gunpowder-based projectile weapons and the increasing industrialization and mechanization of war. Military logistics followed suit to support the new requirements brought on by the increased size and dispersion of armies and their technological advances.

At first, the early modern era of military logistics reflected less a defining change in logistical processes than a change in scope. The larger armies of the era lurched between major urban resource areas, and sieges became the defining warfare tactic of the times. Armies ate their way through the countryside to reach an urban target and then settled in to wait out their opponent. A siege was actually a race against time until either the logistical capacity of the countryside gave out and the foreign army went away, a rescuing force arrived, or the besieged ran out of supplies and surrendered.

The magazine or military supply depot system represents an early method of advance provisioning some of the supplies an army would require while passing through its own borders and making a short incursion into enemy territory. The system had many variations throughout history but was refined by the French father-son duo of LeTellier and Louvois. LeTellier recognized the need to have accurate measurements of an army's requirements while Louvois created the first permanent magazines in Europe. While these were important steps in the evolution of logistics, unfortunately magazines are like lighter fluid—great to jump-start a fire but not providing sustained heat. The support of a magazine extended to only 100 miles. An army on the march still required thousands of pounds of fodder, food, and water daily—the preindustrial precursors to the petroleum fuel and packaged military rations of today.

Though known for his tactical brilliance, Napoleon Bonaparte was a meticulous strategic and operational planner who used the entire state bureaucracy to his advantage in organizing logistics

to support his campaigns. Though execution sometimes faltered, his logistical planning employed all the available assets of his time: supply trains, magazines, contracting, and foraging. It is perhaps in contracting where his agents and apparatus excelled. The ability to field large popular armies corresponded with the rise of a mercantile and banking class of citizenry to supplement increased government bureaucracy. The combination of state planning and contracting out procurement and delivery was at that time a cheaper alternative than developing a state logistical system. Despite all of these advances in logistics, however, the best way to feed an army in the field was still the ancient tried-and-true method of foraging.

Principles, Functions, and Classes of Supply

Throughout history, as the scale and scope of state-sponsored war increased so did the study of war by practitioners, politicians, and early academicians—many reprising all of those roles. The need to quantify and categorize is a habit of the state bureaucracy that seeks to control that which is sometimes uncontrollable. Though mentioned here in modern terms, the principles of military logistics, its functions, and the classes of supply have their equivalents in the Egyptian and Chinese Dynasties through the Roman and Byzantine Empires.

A concise definition of logistics principles is best represented by the logistics doctrine in the U.S. Army Doctrinal Publication (ADP) 4.0, *Sustainment*:

Responsiveness is the ability to react to changing requirements and respond to meet the needs to maintain support. Anticipation is the ability to foresee operational requirements and initiate actions that satisfy a response without waiting for a formal order. Improvisation is the ability to adapt logistics operations to unexpected situations or circumstances affecting a mission. Continuity is the uninterrupted provision of logistics across all levels of war. Simplicity relates to process and procedures to minimize the complexity of logistics. Economy represents the provision of logistics resources in an efficient manner to enable a commander to employ all assets to achieve the greatest possible effect. Survivability means protecting logistics supplies, personnel, and equipment while still ensuring mission support. Integration is combining all the elements of sustainment (tasks, functions, systems, processes,

and organizations) to operations thus assuring unity of command and effort.

In addition to the characterization of logistics principles, there have been many attempts to categorize the various functional areas of logistics. The current joint list of functions adhered to by the U.S. Department of Defense include supply, maintenance, transportation, field services, general engineering, explosive ordnance disposal, and health service support. Additionally, the category of personnel functions provides for human resources, legal, and religious support, along with financial management. These functional divisions are helpful when making procurement decisions, arranging for storage or warehousing, and maintaining financial accountability.

The final categorization of military logistics involves the creation of various classes of supply to facilitate improved management and accountability. With some exceptions, most modern armies define the classes of supply as follows: Class I represents rations and water; Class II equates to durable or consumable goods, such as tools and uniforms; Class III comprises petroleum products—whether grease, oil, or fuel; Class IV consists of both construction materials and barrier materials used to build defensive positions; Class V is all types of ammunition from bullets to shells to missiles and mines; Class VI refers to personal-use items like toiletries and alcohol; Class VII represents major end items, such as tanks, aircraft, and ships; Class VIII includes medical and first aid supplies and equipment to include blood; Class IX equals repair parts for all pieces of equipment; and Class X supplies are humanitarian in nature from farm supplies to seeds.

The Mechanization of Modern War and the Rise of Echeloned Logistics

The rise of modern, industrialized warfare signaled a fundamental shift in logistics. Although defining the moment this transition occurred is extremely difficult, the U.S. Army historian James Huston offers perhaps the best articulation of the industrialized dividing line, at least for logisticians. Huston posited that an army quartermaster officer from the 1820s could experience a Rip Van Winkle nap, wake up in 1914 at the onset of World War I, and find himself still able to function in the performance of his job. But waking a mere 4 years later, in 1918, that logistician might

as well have awakened in the science fiction world of Buck Rogers.

Ironically, the inventions and industrialization that created modern militaries also created additional logistics burdens. Trading horses and the fodder of the field for mechanized vehicles and petroleum may have increased the speed and operational reach of forces, but at the cost of increasing complexity and a larger tooth-to-tail ratio. Surprisingly, Class V ammunition requirements were almost inconsequential from a logistical standpoint until World War I, when they grew to represent the second greatest tonnage of supply required in war.

Logistics became echeloned at the strategic, operational, and tactical levels. Strategic logistics represents the connection of a nation's industrial and economic base to military operations and includes the production, acquisition, and stockpiling of equipment and raw materials for war. When combined with mobilization, strategic mobility, and distribution, strategic logistics reflects the sum of national capabilities. The distance across which the nation can project decisive military power is its strategic reach. Strategic reach provides the capability to operate against complex, adaptive threats. This multifaceted reach combines joint military capabilities—air, land, maritime, space, special operations, and cyber—with those of other instruments of national power.

Operational logistics represents the management functions of planning, preparation, processes, and system. The focus at the operational level of war is on campaigns and major operations. Tasks that support operational logistics include logistical preparation of the theater through intelligence analysis and establishing and organizing the theater logistics system to prepare for the reception, staging, and movement of tactical forces. The management of materials, supplies, and the theater distribution system preserves and extends the reach of the combat forces.

Tactical logistics supports battles and engagements through the functions of manning, arming, fueling, moving, fixing, and sustaining the soldier. The majority of tactical support organizations come from the army, although sister services (mainly the Marines), the host nation, multinational entities, or contractors can represent other sources.

Army and marine logistics organizations operate similarly during most ground operations. Both organizations consist of functional companies and battalions that can be realigned into direct support

or general (area) support units. Some units are multifunctional, including tactical equipment for smaller deliveries and a cross section of all equipment, while other units are specialized for one commodity with specialty equipment to supply fuel, ammunition, or water. Notable differences include a combined force structure of marines and navy personnel within marine logistical units, and the marines' specialized amphibious mission requiring over-the-shore logistics.

Both army and marine ground-based logistics missions include tractor-trailer units and fuel trucks equivalent to those driven on U.S. highways every day. Heavy expanded mobility tactical trucks, or HEMTTs, come in many variations (fuelers, wreckers, and cargo haulers) and are used for movements across terrain. The palletized load system consists of a truck and trailer combination with flat racks that can be downloaded and left at the battlefield. Heavy equipment transports carry loads up to and including 70-ton main battle tanks. Additional vehicles include 5- and 7-ton trucks (made rugged enough for off-road use); forklifts in many configurations to handle cargo, rough terrain, and containers (RTFL, RTCH); water trailers; and recovery vehicles—tracked M88s to tow tanks, kitchen trailers, and ambulances in wheeled and tracked configurations.

Twentieth-century military logistics reflected the ongoing development in American logistical models through World War II, the Korean War, the Vietnam War, and Operations Desert Shield and Desert Storm. The procurement and movement of mountains of supplies around the globe—known as supply point distribution—and the construction of huge overseas support areas facilitated the positioning, employment, and protection of resources required to sustain, enable, and control combat operations. These actions occurred regardless of the service, with the air force and the navy following similar logistics maxims to those embraced by the army. While still retaining some of these characteristics, logistics operations in Iraq and Afghanistan took on a more postmodern feel.

Postmodern 21st-Century Logistics

Logistics places many limits on armies that reduce operational reach. The process of generating combat power and increasing the operational reach of the combat forces is rooted in the friction between the values of efficiency and effectiveness. In essence, it is a battle of wills defined by resources and risk.

Moving men, material, and supplies in a strategic environment is usually low risk and presents greater opportunities to seek efficiency through conserving resources or maximizing their application. The fighter pilot, the naval gunnery chief, and the soldier in the foxhole care little about efficiency. They want ammunition, fuel, food, and water in abundant quantities with little fear of running out. Effectiveness is not cheap.

A modern military is an expensive beast. A heavy armor brigade combat team burns more than 75,000 gallons of fuel per day, and requires up to 50 tons of ammunition and 50 tons of other supplies per day. The 10 or more surface ships making up a carrier battle group require underway refueling and resupply every 3 days in a complex ballet of surface combat logistics with ships making leapfrog trips to ports and back and helicopters conducting vertical replenishment operations flying from deck to deck. Power for all these modern machines comes not only from petroleum-based products but also from batteries—an endless slew of batteries of all shapes, sizes, and weights. A modern air assault infantry brigade uses more than \$1.5 million worth of batteries in a 5-day period—roughly one AA battery per infantry soldier per hour.

Added to the cost of procuring all of these supplies is the cost of carrying or moving them to a user's destination. When movement to places such as the Balkans, Somalia, Iraq, and Afghanistan is needed, effectiveness as well as efficiency can be overwhelmed. The \$4.00 gallon of gas in the United States becomes \$40 when moved to Somalia and \$400 when moved to Kandahar province, Afghanistan. Additionally, the time required to build up supplies prior to an operation telegraphs intent and reduces the element of surprise. Geography, particularly long lines of communication or urban concentrations, will continue to be a limiting factor.

Twenty-first-century logistics seeks to overcome these limits through collaboration between new concepts of doing business (conducting operations) and new technology. Identification and visibility of materiel and assets, whether stationary or in motion, through the use of automated identification technologies (bar codes, radio frequency identification devices, satellites) has allowed the U.S. military to reduce its iron mountain supply point and transition to a distribution-based model where inventory is constantly in motion and always visible in a seamless supply chain. The inventory in the pipeline concept reduces

the logistics footprint on the ground, which can be a good thing in austere or immature theaters where the available level of physical infrastructure, skilled personnel, and resources in a theater are limited.

The ideas of pre-positioned stocks and sea basing represent the contemporary evolution of the magazine concept. All U.S. military services maintain pre-positioned stocks of various materials, unit sets, and supplies both on ships and in ground storages. They are maintained, serviced, and rotated by small crews waiting to marry up with forces arriving by air to quickly become combat-capable units. The U.S. Navy and Marines have taken this concept one step further and propose forward-deployed floating bases (or large ships) that are resupplied at sea and then are able to project support to forces ashore or afloat. Contracting has expanded to become operational contracting support where large corporations vie for a long-term logistics capability contracts providing services and supplies to the military. Military units themselves whipsaw between lean constructs of nearly all fighting forces and robust formations of combat and sustainment forces that can be self-sustaining for long periods.

Getting the right stuff to the right place at the right time sometimes depends on technology as well as concepts. Both lighter-than-air blimps and heavier-than-air airframes are under development with both intelligence-gathering and logistics distribution functions. GPS-guided low-altitude parachutes can precisely deliver bundles of supplies to combat outposts situated on mountainsides. Unmanned aerial systems have also delivered loads to remote sites. The joint high speed vessel being built for both the navy and the army is a fast, shallow-draft ship capable of carrying combat units or supplies to a theater. Future development seeks to further unshackle militaries from the twin yokes of fuel and ammunition. Hybrid engines, biofuels, hydrogen cells, long-life batteries, caseless ammunition, lasers, and electromagnetic rail guns are all being developed with the goal of reducing the logistics tail through decreases in weight or through increases in range and accuracy, thus requiring the use of less fuel or ammunition.

Conclusion

Logistics will always be locked in multiple roles: defined and practiced as both the art of logistical decision making and the science of calculations, struggling for a balance between efficiency and

effectiveness, and forever in collaboration and competition with combat operations. Logistics may not solely lose a war and logistics may not solely win a war, but it may certainly dictate the direction and duration. Finally, even in an increasingly specialized and complex environment, the purpose of logistics should always be focused on generating combat power and extending the reach of military forces at the strategic, operational, and tactical levels.

LUTTWAK, EDWARD N.

Edward Nicolae Luttwak (1942–) is an American military historian, national security consultant, and public intellectual, whose books and articles have been seminal in some instances and provocative in others. Born in Romania, he was educated at the London School of Economics and received a

PhD in international relations from Johns Hopkins University. He is currently a senior associate (nonresident) at the Center for Strategic and International Studies in Washington, D.C. He had a brief academic career as a lecturer at the University of Bath (the United Kingdom) and at Georgetown University after relocating to the United States. Postacademia, he has enjoyed a long career as a prolific author, consultant, and occasionally controversial pundit, often going far afield from his acknowledged expertise in military affairs. He has consulted with various agencies of the U.S. government and several foreign governments. In interviews and in various public fora, he has also alluded to his participation in covert security operations for governmental clients to include the U.S. Drug Enforcement Agency, claiming involvement in “field operations, extraditions, arrests and interrogations.” This entry discusses the writings of Edward Luttwak and their impact within the historical and public policy communities.

From Coup d’Etat to Grand Strategy

His career as a scholar and writer began in graduate school with the publication in 1968 of *Coup d’Etat: A Practical Handbook*, an entertaining but nonetheless serious book that dissected aspects of Third World instability. In 1976, he established a solid reputation as a military historian with *The Grand Strategy of the Roman Empire: From the First Century A.D. to the Third*. This book attracted broad scholarly and popular acclaim as well as some criticism, the latter dwelling on his lack of standing as a historian of the ancient world. He periodically returned to the “grand strategy” theme with *The Grand Strategy of the Soviet Union* (1984) and his latest major work, *The Grand Strategy of the Byzantine Empire* (2009). The well-known British military author Sir Basil Liddell Hart apparently coined the term *grand strategy* in the early 1950s in his landmark book *Strategy*, according to some authorities, but gave it no more than cursory mention. With three books bearing the title, Edward Luttwak can justly claim to be the primary modern expositor of this concept, which incorporates the totality of a state’s theory and practice of national security. Other scholars have taken up this theme in recent decades, including Paul Kennedy, Williamson Murray, and Colin S. Gray, but Luttwak’s priority in the field must be acknowledged. He addressed

it from a comprehensive theoretical perspective in his influential book *Strategy: The Logic of War and Peace* (1987, revised 2002), in which he identified five levels of strategy: grand, theater, operational, tactical, and technical. The interplay among these, he argues, is often complex and not infrequently a focus on one factor works to cancel out one or more of the others.

Air Power and Maneuver Warfare

A recurring theme in Luttwak’s writings is the importance of maneuver warfare at the operational level, conducted so ably by cavalry armies in the distant past and in recent times by those acknowledged masters of mechanized warfare, the Germans. He has yet to publish at full length on this topic, but in characteristic fashion, he has staked out his position in a couple of controversial articles: “The True Military Revolution at Last” in his recent collection of essays, *The Virtual American Empire: War, Faith, and Power* (2009), and “In Praise of Aerial Bombing” (2010). The core of his argument is that modern technology enables real-time intelligence and target acquisition coupled with unprecedented weapons delivery precision from aerial platforms—the realization of the “reconnaissance-strike complex,” a decades-old Soviet concept long admired by Western military theoreticians. This development further enables ground maneuver forces to sever their dependence on field artillery, which has historically constituted the largest fraction of their logistic burden. Freed from a cumbersome supply train, ground forces now have a much greater scope of maneuver.

Other Writings

In 1976, Luttwak collaborated with the Israeli scholar Daniel Horowitz on *The Israeli Army: 1948 to 1973*, an insightful institutional study that surveyed the organizational, doctrinal, and operational history of one of the world’s most successful military establishments. In 1985, he published *The Pentagon and the Art of War: The Question of Military Reform*, an early endorsement of the Carter-Reagan era military buildup that by the middle of the 1980s had given the United States and the North Atlantic Treaty Organization a significant qualitative edge over the Soviet and Warsaw Pact nations. In typical counterintuitive fashion, he argued that

some problems could in fact be solved by throwing money at them, despite the accompanying “waste, fraud, and mismanagement.” He has also written in a somewhat pessimistic tone about socioeconomic issues in books such as *The Endangered American Dream: How to Stop the United States From Being a Third World Country and How to Win the Geo-Economic Struggle for Industrial Supremacy* (1993), and *Turbo-Capitalism: Winners and Losers in the Global Economy* (1999).

Realism and the Use of Force

A firm disciple of the “realist” school of international relations, Luttwak writes with biting, often remorseless, cynicism about the constructive use of military force while despairing of the paralyzing sensitivity of the cosmopolitan West to issues such as collateral damage and civilian casualties. Without praising either the Romans or the Nazis, he has called attention to their successes in counterinsurgency warfare, largely (in his view) a result of their willingness to make judicious use of both selective and wanton brutality. At the other end of the spectrum, he excoriates the United States and its Latin American partners for their pointless expenditure on military force and resources in the fruitless “war on drugs.” A seminal essay titled “Pablo Escobar and the War on Drugs” is included in *The Virtual American Empire*.

M

MAHAN, ALFRED THAYER

Alfred Thayer Mahan (1840–1914) was a U.S. Navy officer and naval historian and theorist. He was born on September 27, 1840, at West Point, New York, the first of six children. His father, Dennis Hart Mahan (1802–1871), was a distinguished professor of engineering and the science of war and dean of the faculty at the United States Military Academy. Alfred Thayer Mahan entered the United States Naval Academy at Annapolis, Maryland, in 1856 and graduated second in his class in 1859. Mahan's service in the Civil War was spent on blockade duties, where he saw no serious combat. His subsequent naval career in a variety of sea and shore appointments was on the whole routine. Mahan's first article, an essay on naval education, was published in the *United States Naval Institute Proceedings* in 1879. Mahan's first book, which was published in 1882, was a short history of riverine and coastal operations in the Civil War. Mahan's intellectual abilities attracted the attention of Rear Admiral Stephen Luce (1827–1917), who selected him to teach at the newly founded United States Naval War College at Newport, Rhode Island, where he served from 1886 to 1892. His second and most famous book, *The Influence of Sea Power Upon History, 1660–1783*, appeared in 1890 and was followed by three sequel histories (1892–1905), each of two volumes, as well as 15 other books that dealt with a variety of subjects, including naval history, naval strategy, international politics, autobiography, and

even theology. Mahan retired from the navy in 1896 to devote his full attention to writing. He died on December 1, 1914, in Washington, D.C. Mahan's publications established his reputation as the greatest and most influential naval historian and theorist of all time. This entry examines the writings and views of Alfred Thayer Mahan.

In his major books, Mahan presented five forms of argument: (1) political, (2) political-economic, (3) governmental, (4) strategic, and (5) professional. Mahan's political argument was that sea power had played a decisive role in the history of international relations and would continue to do so. His political-economic argument was that national prosperity—and in turn the capacity of the state to wage war—depended to a very great degree on external trade, which required the protection of a strong navy. His governmental argument was that decision making by the state or its primary agents in peace and war could play a decisive role. His strategic argument was that history demonstrated the existence of strategic and logistical principles that possessed a certain instructional value. And his professional argument was that in war executive officers needed to be able to make decisions quickly in the face of considerable uncertainty caused by changing conditions, incomplete or even misleading information, and fear.

Mahan's arguments were divided into two groups. Political, political-economic, and governmental arguments were the means by which he addressed naval grand strategy in a manner that supported a navalist political agenda. Strategic and professional arguments were the means by which

he engaged the art and science of command in war in a way that advocated a particular form of naval officer education. In the first group, governmental argument was predicated on the proposition that decision making by individuals—whether acting alone or collectively as the government—mattered and thus counterbalanced the determinist character of its two partner arguments. In the second group, naval professional argument, which in part emphasized the importance of judgment in war, offset a tendency toward the mechanical application of principles that was inherent to strategic argument.

Mahan defined sea power as a supranational interconnected system of naval strength *and* mercantile enterprise whose existence and development depended on the actions of governments and commercial entities around the world. Mahan believed that, in general, sea power could serve the interests of multiple states and, in particular, that it could, through sound government policy that addressed both naval and commercial issues, serve those of his own country. Mahan's geopolitical perspectives thus had four major aspects. First, Mahan's main concern was the critical importance of decision making by statesmen and admirals, not the power of geographical factors alone to determine the course of history. Second, Mahan was convinced that naval supremacy in his own day and in the near future would most likely be exercised by a transnational consortium made up of Great Britain and the United States because neither power possessed the resources to maintain a large enough navy to do the job on its own, while both had large and growing seaborne commercial interests that needed strong protection in the event of war. Third, for most of his life, and including the period covering the first two installments of his "Influence of Sea Power" series, Mahan's economic ideal was global free trade, a system that was an integral part of his concept of sea power and that, he was convinced, favored peace rather than war. And fourth, Mahan did not have a single vision of the future, and while he was certain that sea power was bound by the nature of things to play an important role in international affairs, he did not hold that it would necessarily define its terms or dictate its outcomes.

MAO ZEDONG

Mao Zedong (1893–1976) was a revolutionary, Marxist, political theorist, poet, military strategist, long-term leader of the Chinese Communist Party (CCP), and founding father of the People's Republic of China. He ranks as one of the most influential figures helping shape 20th-century China and the world. This entry discusses Mao's military thinking and strategy.

As a military strategist, Mao's theories were formed in a series of conflicts: the First Revolutionary Civil War (the First United Front) from 1921 to 1927, the Second Revolutionary Civil War (the Land Revolution) from 1927 to 1936, the Second Sino-Japanese War from 1937 to 1945, the Third Revolutionary Civil War (the Liberation War) from 1946 to 1949, the Korean War from 1950 to 1953,

and border military conflicts in the 1960s. Military leadership was a centerpiece of Mao's life. His strategic legacy remains highly respected and continues to influence contemporary Chinese elites.

Mao's Military Strategy in the Land Revolution

While attracted to the 1917 Russian revolution, Mao held that the Russian model was inappropriate for China. Living in an overwhelmingly agricultural society, Mao saw the Chinese peasantry, rather than the urban proletariat, as the basis for revolution. "To encircle the cities by the surrounding countryside" was one of the Mao's most fundamental principles of political/military strategy.

Mao first realized the importance of armed struggle in 1927 when the CCP was nearly destroyed by Nationalist military forces. He retreated to the countryside to establish a revolutionary base area and began forming the Red Army. In a speech to the Central Committee of the CCP, Mao famously argued that military power was necessary for revolution, as "Power grows from the barrel of a gun."

A reader of Sun Tzu's *Art of War*, Mao developed poetically articulated guerrilla strategies for his young Red Army: "The enemy advances, we retreat; the enemy camps, we harass; the enemy tires, we attack; the enemy retreats, we pursue" (Mao, 1965c). This strategy was designed to enable the weaker side to fight and beat the stronger side. It turned out to be a lifelong feature of Mao's military style.

During Chiang Kai-shek's offensive military campaigns in the early 1930s, Mao applied these tactics effectively. After luring the enemy into the revolutionary base area, the Red Army made use of natural geographic advantage and mass support to eliminate the superior military force.

Mao's Military Strategy in the Second Sino-Japanese War

During the Second Sino-Japanese War from 1937 to 1945, Mao made it clear that a protracted war, consisting of three phases, was the only correct approach to defeat the Japanese. These phases were designed to progress from Japan's strategic offensive and China's strategic defensive to strategic stalemate and finally to China's counteroffensive. Mao argued that as China was still weak, it needed time to gradually become strong. Mao sent his army in groups into the Japanese occupied areas for mobile

and guerrilla warfare and successfully expanded his army as well as "Liberated Areas."

The 10 Principles of Military Strategy During the Third Revolutionary Civil War

In the Third Revolutionary Civil War between Jiang's nationalist and Mao's communist armies, Mao created 10 principles of military strategy. His core ideas were focused on eliminating the enemy's human force rather than occupying territory. Mao also concentrated on creating an absolutely superior force to eliminate the enemy in every battle. In those efforts, Mao combined mobile and positional warfare to achieve victory. After three military campaigns—Liaoning-Shenyang, Huai-hai, and Beijing-Tianjin—the Nationalist army, though better equipped and backed by the United States, lost the war.

Mao's Strategic Decision to Participate in the Korean War

Initially, there seemed no reason for Mao to enter the Korean War, as a huge power gap existed between the Chinese and the U.S. militaries. Each American corps had 1,428 artillery pieces, while its Chinese counterpart had only 198. China also lacked an air force and navy in 1950, so Mao's military supply system had no protection. That was partly why General Douglas MacArthur convinced President Truman that his army would slaughter Mao's troops if the latter dared to enter the war.

But Mao looked at the Korean War from a political perspective. He needed to secure his newly established regime by persuading people at home that he could stay in power for a long time and not be intimidated by the United States. Mao's strategy was undoubtedly influenced by two powerful historical lessons: the Manchu attack in 1644 and Japan's attack in 1931. Both started around the Korea area and spread into the whole of China.

Mao's overall strategy against the United States was gradually formed from 1944 to 1946 when America was pro-Nationalist. Mao was convinced that Washington would interfere with China's affairs sooner or later in the interests of its global strategy. The UN troop's crossing the 38th parallel confirmed Mao's worry that Washington would invade China through Korea and wipe out Mao's communist revolution. If China did nothing, it would face the following four grave challenges:

1. China's buffer area would be gone. The People's Republic of China had no worry about the safety of the northeast as long as the North Korean Communist regime was there. But if it faced a hostile regime at the Sino-Korean border, China would have to dispatch massive forces to guard the country.

2. The Northeast might become an area of Washington-Moscow confrontation. On October 6, 1950, Stalin urged Kim Il Sung to set up a government in exile in the Northeast of China and organize a guerrilla war there. From Mao's perspective, this would offer an excuse for the United States to invade China to fight Kim's remaining forces. Stalin could also take advantage of this opportunity to dispatch his troops to this region in the name of protecting China. China's territorial sovereignty would likely be sacrificed.

3. Northeast China, with its rich natural resources, advanced industry, and skilled laborers would be threatened. There would be no way for CCP leaders and the people in this region to concentrate on industrial production, and China would lose her most powerful engine of economic rehabilitation and industrial development.

4. From the perspective of domestic politics, Nationalist remnants in mainland China might be bold enough to challenge the new regime if they had hope of overthrowing this new authority. The stability of Mao's regime would be questioned by those Chinese who were otherwise prepared to cooperate, particularly the bourgeoisie and intellectuals who resented socialism and remained pro-America. As Mao feared,

If we send none of our troops and allow the enemy to reach the banks of the Yalu River, the international and domestic reactionary cry will surely become louder. Such a situation will be very unfavorable to us and will be even worse for the Northeast. (Mao, 1987, p. 556)

Bearing in mind these considerations, Mao decided to enter the war against the United States in Korea. Mao's strategy was to first get political support from the Chinese people. He initiated the slogan: "Resist the United States and aid Korea. Guard our families and defend our nation." This slogan effectively linked this war with the Chinese people's own interests and the national security.

Facing the most powerful country in the world, Mao believed that the most effective way to fight was to take advantage of MacArthur's arrogance and underestimation of Mao's army. Mao's now familiar strategy was to create a misperception that China had no intention of entering the war, initiate a surprise attack, fight at night, concentrate on mobile warfare, and employ a numerically superior force in each battle.

The first two phases of the People's Volunteer Army's (PVA) military campaigns revealed Mao's military artistry. After the first encounter with UN troops, Mao ordered his army to disengage the enemy and hide themselves immediately. This deliberate withdrawal reinforced MacArthur's misconception that only a small Chinese army was involved in the war. When UN troops rushed to the border of China without coordination, they faced surprise attacks one after another. The result was that the PVA successfully repelled the UN troops and pushed them back to the 38th parallel after just two military campaigns.

However, the PVA's disadvantages in a modern war soon became apparent. Having realized that the PVA was limited to 1-week offensives, as PVA soldiers' food and ammunition could last only for 1 week, General Ridgway adopted a new strategy of disengagement. UN troops withdrew and avoided a direct fight with advancing PVA's troops in the first week. Then the UN troops engaged in fighting when PVA soldiers did not have food and ammunition. This new strategy caused tremendous PVA losses. Mao had to shift from mobile warfare to positional warfare through the use of bunkers after the fifth offensive campaign. This new military strategy effectively offset the advantage of the UN troops, despite their air attacks and modern weaponry. Ultimately, the war became a battle of wills. After a stalemate of 2 years, the Korean War came to an end.

Many militarists regarded the result of the Korean War as Mao's failure because of the PVA's tremendous personnel losses. In Larry Wortzel's words, "China sustained heavy losses and suffered a strategic geopolitical defeat" (Burkitt, Scobell, & Wortzel, 2003, p. 327) in the Korean War. However, Mao and the CCP looked at it very differently: Marshal Peng Dehuai returned as a hero, while MacArthur was fired by Truman. It was the first time since the Opium War that a Chinese army was able to defeat or break even with the world's most powerful

military force by itself. It was almost a miracle for Mao to force Truman to accept a truce, given the fact that the PVA entered the war without its air force or navy and facing a serious shortage of food and ammunition. Second, Mao achieved his political objective of making North Korea a buffer area for China. Third, Mao's regime won the confidence of the Chinese at home and abroad after the Korean War. Politically and psychologically, Mao's statement that the "Chinese have stood up" became true.

Tactical Offensive and Strategic Defensive During the Sino-Indian War

Competition for disputed territory led China and India into conflict in the Sino-Indian War in 1962. Frustrated with India's "forward policy" (China characterized it as a policy of "nibbling") to control disputed territories in the Sino-Indian border since 1959, Mao launched a military offensive. He called it a "self-defensive counterattack." After two phases from October 20 to 24 and from November 16 to 21, Chinese People's Liberation Army troops wiped out most of the Indian Fourth Army and drove the enemy to "the line of actual control." Mao made use of traditional mobile warfare in this conflict. The People's Liberation Army concentrated a superior force to make a frontal attack, and at the same time, attacked the Indian army from both flanks. Following the attack, People's Liberation Army troops eliminated the isolated enemy one by one.

To the surprise of India and the world, China announced a unilateral cease-fire twice, on October 24 and November 21, and Chinese troops withdrew 20 kilometers behind the line of actual control. Facing an American military threat from the east and south, and a Russian challenge from the north, Mao's purpose was to thwart Indian's attempt at territorial expansion and maintain peace on the Sino-Indian border. It was a tactical offensive in the form of a strategic defensive. That is, Mao made use of military initiative to create political conditions favorable to resolving the border conflict on Beijing's terms in the "diplomatic struggle." Mao claimed that this war dealt India a heavy blow and maintained peace for 10 years. Actually, India has not challenged the status quo since the Sino-Indian War in 1962.

The People's War forms a key aspect of Mao's military theory and practice. In Mao's words, "The richest source of power to wage war lies in the

masses of the people" (Mao, 1967c). "The revolutionary war is a war of the masses; it can be waged only by mobilizing the masses and relying on them" (Mao, 1965a). In Mao's mind, the power of conflict is not only expressed through the competition of military and material strength but also through the competition of manpower and winning the people's support. How to win people's support is the key to successful revolution. Redistribution of land helped the CCP gain massive manpower from poor peasants, the majority of the Chinese people.

It was with support of the people that the CCP could defeat enemies that had greatly superior military strength during the Northern Expedition, the Land Revolution, the Second Sino-Japanese War, the Civil War, and the Korean War.

Mao's United Front forms another important political policy and military strategy. Mao would form a temporary alliance with whoever could help him achieve his political objectives. He even made efforts to establish a united front with the Nationalist government, including landlords and rich peasants, to win support from the United States during the Second Sino-Japanese War. When this effort to win support from the United States failed, Mao decided to join the Soviet Union in the civil war and the Cold War. Later, Mao again showed his flexibility by overlooking past hostility with Washington and becoming a new U.S. ally when China was facing military threat from Moscow in the 1970s.

Strategic Thinking and Tactical Preparations

Strategically, Mao scorned all his enemies no matter how powerful they were. However, tactically, Mao treated his enemies very seriously and concentrated absolutely superior force at every possible opportunity to achieve victory. On the one hand, Mao was very good at finding his enemy's strategic weakness and disadvantages. On the other hand, he could highlight the strong points of his own side no matter how weak it was. In this way, he gained confidence in himself and transferred his confidence to his party and army. For example, the CCP experienced heavy losses during the Land Revolution, but Mao was very confident that his party and the Red Army could survive and develop because China was experiencing almost constant fighting between different warlords supported by different imperialist powers. Moreover, most of China's

population was poor peasants, and they supported the land revolution. When the civil war broke out, Mao told his party that the CCP could not be better off because of the expanded revolutionary base areas, a well-trained and experienced army, and the support of peasants. In contrast, Chiang's civil war was not popular with ordinary people, especially in the countryside. To relieve fear of the United States, Mao told his party, "All reactionaries are paper tigers. In appearance, the reactionaries are terrifying, but in reality they are not so powerful. From a long-term point of view, it is not the reactionaries but the people who are really powerful" (Mao, 1969f, p. 100). The development of both strategic and tactical views put Mao's army in a confident and advantaged position.

Taking Initiatives Within a Flexible Military Strategy

Mao's armies generally (but not always) took a strategically defensive stance in the wars that Mao experienced. The great exception was the civil war battles of 1948–1949. However, Mao always opposed passive defense and preferred to be proactive rather than reactive. That is to say, he would advocate tactical initiatives in a situation and at a time favorable to his army. Thus, Mao would recommend a tactical offense within a strategic defense, a fast-paced battle within a protracted war, and a surprise attack from the rear of the enemy instead of a frontal assault.

In conclusion, Mao was both a political strategist and a military strategist, and his military means always served his political ends. With his military strategy, Mao defeated his enemies one after another and established the People's Republic of China. His military thinking and strategy have become a legacy in military history and continue to have an impact on the world, particularly Third World countries, today.

MARINE CORPS, U.S.

The U.S. Marine Corps is a very unique military organization that has been at the forefront of American defense and national security for more than 235 years. While modeled off of the Royal Marines, the U.S. Marine Corps has become distinctive in terms of its size, the strength of its institutional culture because of its historical achievements, its relationships to the other U.S. military services, and its continuing central role in American force structure and power projection capabilities. This entry discusses the history of the U.S. Marine Corps, the corps' distinctive culture, and differences—sometimes rivalry—between the Marine Corps and the other services.

Origins and Early Decades

The U.S. Marine Corps traces its origins to November 10, 1775, when the Continental Congress created the Continental Marines as an adjunct force to the Continental Navy. The Continental Marines fought throughout the American Revolution, primarily as sharpshooters in the masts of Continental naval vessels during ship-to-ship engagements, landing parties in small-scale amphibious operations, and ship-board security guards for naval vessels and bases. All of these missions were fairly typical for marine forces in the 1700s and were modeled on missions from the Royal Navy and Marines, on which the Continental Navy was modeled.

Like the Continental Navy itself, the Continental Marines were disbanded at the end of the Revolution in 1783 and not resurrected again until the Quasi-Naval War with France (1798–1801). After that time, the marines were never again disbanded, though they were threatened with it on several occasions over the next century and a half. Performing largely the same missions as during the Revolution,

the marines in the Quasi-War, the War of 1812, the Seminole War, and the Mexican-American War found themselves in each major engagement the United States took part in during the antebellum period, but they also took on additional roles as required. At the insistence of their longest serving commandant, Brevet Brigadier General Archibald Henderson, the marines took on any and all missions that kept them in the national spotlight, gained the favor of politicians, and prevented the U.S. Army from having them disestablished as a “second army.” Such a mixture of pragmatism and flexibility has been a hallmark of the corps’ existence throughout its history. Under Henderson, the Marine Corps survived these “doldrums” and took part in similar types of missions during the American Civil War, when there also existed a Confederate Marine Corps modeled on its prewar Yankee forefather.

Surviving the Gilded Age and Progressive Era

The Marine Corps, like the U.S. Navy and U.S. Army, endured another period of national, political, and budgetary neglect during Reconstruction and

the Gilded Age, numbering no more than a few thousand at best, relegated to similar missions as before the Civil War, and constantly seen as a wasteful duplication of the army. Again taking on any and all missions that pleased its political masters—including strike breaking—the Marine Corps survived to be able to take part in the Spanish-American War and began Progressive Era reforms for the increased professionalization of its officer corps. The Spanish-American War saw the marines primarily again in naval adjunct roles but also helping man gun turrets on new armored battleships and cruisers. Moreover, senior political and military authorities began dimly recognizing by the end of that war that there was the need for the United States to have a force that could seize and defend bases outside of the Continental United States. This recognition by American politicians of the need for a force that could participate in an amphibious warfare role combined with the obvious need for the United States to have light military forces for duty in places such as Central America and East Asia. The latter duty resulted in the Marine Corps writing one of the first manuals on irregular warfare, the *Small Wars Manual*, the predecessor

Historical image of a marine battalion in front of Commandant's House at the marine barracks, Washington, D.C., 1864.

to many of the counterinsurgency doctrines of the later 1900s and early 2000s. All of these duties combined again allowed the marines to survive, to grow into a larger force, and then to take part in some of the bloodiest trench warfare when the United States entered World War I in 1917. These missions also allowed Marine Corps leaders such as Major General Commandant John A. Lejeune to continue thinking about amphibious assault as a potential mission for the marines.

Finding Amphibious Assault and the Pacific War

This kind of thinking was even more vital after 1919. Although the marines had gained great fame in battles such as Belleau Wood, the marines' role in trench warfare also allowed the army to once again argue that the Marine Corps was a wasteful duplication of the army. Lejeune and his protégé,

Lieutenant Colonel Earl Ellis, therefore focused on the navy's plans to fight Japan in the Pacific and began portraying the marines not so much as a naval adjunct for guarding ships and bases but as a full-blown amphibious assault force that specialized in that type of warfare as no other branch did. This focus within the navy's sea control mission afforded the marines, especially officers such as Major (later General) Holland Smith, the opportunity to begin developing amphibious assault techniques and technology in the 1920s and 1930s, to begin practicing those types of exercises before the start of World War II, and even to write amphibious assault doctrine into documents such as the *Tentative Manual for Landing Operations* (1934).

Accordingly, the Pacific war was a watershed and even godsend for the marines. Their pioneering of amphibious warfare doctrine, techniques, and technologies meant that the Pacific war was seen by the American public and politicians as a "Marine Corps war," much to the chagrin of the army. The fact that the marines largely taught the army in the Pacific how to carry out these types of operations—even though the latter service outnumbered the marines by a ratio of four to one during the war—added even more to the public's image of the ground phases of the war as largely Marine Corps operations. The marines did not waste this opportunity either, capitalizing on the publicity gained from their role in battles such as Guadalcanal, Tarawa, and Iwo Jima to score major lobbying victories with Congress, the media, and the public, inroads that would help the corps greatly in the immediate postwar period.

The Cold War and Beyond

One problem the corps had in 1945, however, was that it had grown during the war to six divisions and four aviation wings, and it truly did look like a second army to a budget-conscious Congress. In the postwar battles in Washington, D.C., over such controversial issues as defense unification, roles, and missions, it was not even clear if the navy, under assault by the Army Air Forces, might not offer up the marines for elimination as a way to keep naval aviation from U.S. Air Force control. In the end, however, senior and mid-grade Marine Corps officers were able to use their clout with the public and influential members of Congress to get roles for the marines written into the various national security acts of the early Cold War.

The Cold War, however, presented a doctrinal challenge to the marines since the primary enemy, the Soviet Union, did not have much of a fleet and did not have outlying bases that would need to be seized and defended. The navy did, however, very quickly create the origins of what would later be called the Maritime Strategy, whereby it would project American naval power toward and into Soviet territory in areas such as the Mediterranean Sea, the western Pacific, and later (by the 1970s and 1980s) the North Atlantic. Where the navy went, the marines accompanied, even developing their own mix of forces for Arctic operations in Norway and strikes into the northern Soviet Union. In addition, the marines continued to guard naval bases and to provide internal detachments on large naval vessels such as aircraft carriers and cruisers, but their primary duty, just as in the interwar period, was as a light infantry and quick reaction force for political crises such as in the Dominican Republic in 1965. Even more so, these “light” infantry duties turned into heavier force operations in Korea and Vietnam, but always with an emphasis on quick response by the marines so as to continually differentiate the corps from the army. Operations and exercises in Korea, Vietnam, Norway, and later Panama, Kuwait, and Iraq, however, led the marines to need armor, field artillery, tactical air, and combat engineers in a major way, so the marines were always concerned about a harsh budgetary climate perhaps leading to calls for their disestablishment as a “second army.”

The marines were fortunate in that each time they seemed to look like a maritime copy of the army, operations came along that allowed their particular role to shine. For instance, in the Persian Gulf War, the marines were used as amphibious decoy forces to keep the Iraqis busy in Kuwait while U.S. and coalition forces carried out the “left hook” into the desert to envelop Iraqi forces. While the marines were not thrilled with this type of decoy mission and were truly prepared to carry out an amphibious assault, the success of the mission nevertheless added to Marine Corps prestige. In the Global War on Terrorism, the marines have integrated themselves into the navy’s “From the Sea” Strategy and “New Maritime Strategy” and have argued that marines deployed in Afghanistan and Iraq are actually the ground force power projection of the American naval power. Time will tell, however, if this type of strategy allows the marines to survive

what will probably be very lean budgetary times for the early 21st century American military as a largely deindustrialized United States deals with major domestic economic problems. Given that the marines were well inland in Iraq and Afghanistan with heavily mechanized forces trying to perform both conventional and counterinsurgency missions that the U.S. Army is also performing, it may be difficult for the marines to continue to argue that they are so distinctive. It is doubtful, however, that calls for the marines’ disestablishment would really lead anywhere given the corps’s high popularity with the public as the embodiment of American military virtues as well as the Marine Corps’ utility in the Defense Department’s latest strategy oriented toward the People’s Republic of China, Air-Sea Battle.

Marine Corps Culture and Performance

From the very start of its history, the Marine Corps developed a distinctive military culture. This could be seen in the 1900s, in particular, since the marines emphasized their own service or corporate history as a central part of their culture and identity building. The marines, in fact, made the most of their history much earlier than the other services, perhaps not only out of desperation and a means to illustrate that they were unique and therefore worthy of being retained but also because this strong sense of history and tradition became part of the training, the leadership, and the “mystique” of the marines. Other things set the marines apart early on as well. Unlike the U.S. Army—which did accept African American soldiers during the American Revolution and even integrated them into the ranks at that time—the marines from the beginning refused to enlist African Americans, other minorities, or women. This parochialism continued without the slightest change until presidential orders in World War II forced the service to accept limited number of female and minority recruits.

Much more than institutional racism, however, defined Marine Corps culture. Again, from the very beginning of the corps’ existence, the marines were highly selective about enlistees, including the physical size and health of the recruits. The fact that the marines remained the smallest service (and still is, with the exception of the U.S. Coast Guard) meant that it could maintain that selectivity into the present. Marine Corps selectivity went beyond physical

requirements, however, and still does. U.S. Marines from all eras talk about the marines endowing a special kind of confidence and esprit de corps in terms of training, leadership, and even the distinctive uniform. Eugene Sledge, a mortar man in the 1st Marine Division at Peleliu and Okinawa, talks at length in his wartime memoir about the particularly difficult training that he endured as a recruit trainee that he argues prepared him for the extraordinarily traumatic combat that he endured. Many other marines from World War II echo Sledge's comments, while wartime memoirs of U.S. Army personnel talk about how their training was very often counterproductive to the actual conditions they encountered in combat.

Moreover, postwar records show that the marines had a decidedly lower percentage of battle fatigue casualties than any other service, something again that is typically attributed to training, leadership, and the esprit created by the mystique of the corps. Comparisons to other services are interesting in that members of the U.S. Navy typically become attached to their ships, U.S. Air Force personnel obviously become attached to their aircraft, and members of the U.S. Army typically talk about their leaders or perhaps units. Marines, however, have had these kinds of attachments to their entire service. At significant times, of course, this distinctiveness has led to intense interservice rivalry between the marines and the other services, both officially between leaderships and unofficially in the field and off duty. The marines have often been seen by other services as obviously very competent but also arrogant and clannish, and their image and prestige with the public and with politicians have often been resented.

It has also, however, led to a unique relationship with the Marine Corps Reserve. Long before the Pentagon started talking about a Total Force Policy and that kind of integration between active and reserve forces became a reality, the marines were living this idea by having their Reserve forces conduct real-time training during both weekend and summer drill sessions, by making sure that large numbers of Reserve personnel had prior active service, and by having the 4th Marine Division (Reserve) assigned missions that they trained for on a regular basis during peacetime and would fulfill in case of mobilization. Reports about the competence of the Marine Corps Reserve units differed markedly on a number of occasions with those of the National Guard

forces, especially during the Korean and Persian Gulf Wars, when the latter typically took months of training to be brought up to speed with their active-duty counterpart units, while Marine Corps Reserve forces deployed with minimal preparation time.

Rivalry has at times been significant with the U.S. Navy as well. To a certain extent, Marine Corps history has been one of being tied to the navy's "apron strings." Since the marines grew out of the U.S. Navy, both in 1775 and 1798, and since the marines have always been and still are part of the Department of the Navy, the marines have often been seen, or marines have often felt, to some extent, like the servant of the Fleet. This attitude could be seen when marines were charged with guarding naval bases and providing internal security detachments on naval vessels, something that continued on some American naval vessels until the late 1990s. Of course, in the Age of Sail, marines were also on board to quell potential mutinies, and so they were widely despised by sailors. In the late 1800s and the 1900s, marine detachments continued to have an internal security function, but in a more contemporary context of serving as orderlies to commanding and flag officers, providing small landing parties for expeditionary operations, and guarding nuclear weapons onboard Cold War-era warships. Recently, there is even some discussion of returning marines to smaller warships because of their skill in the anti-piracy operations that are becoming so central to U.S. Navy deployments.

Into the 21st Century

Apart from conducting current operations in the Global War on Terrorism, the Marine Corps has been moving into new ground in terms of its leadership positions in the U.S. national security establishment. During the George W. Bush administration, General Peter Pace was the first marine to become vice chairman of the Joint Chiefs of Staff and then the first marine to hold the chairmanship of that body. In addition, the retired general James Jones became the assistant to the president for national security affairs (better known as the national security advisor) at the beginning of the Obama administration. These positions mark the pinnacle, at this point in U.S. history, of Marine Corps generals in high-level national security positions and demonstrate the degree to which the Marine Corps is taken

much more seriously than it was before the Cold War by the senior national leadership.

It also demonstrates the historical development of senior leadership in the marines, which has been, like its institutional culture, somewhat distinctive. For instance, even today, the marines typically commission more officers from their enlisted ranks than the other services do. This is, in fact, an old tradition from the 20th-century Marine Corps. In the 1800s, the marines largely took their officers from civilian life or, by the late 1800s and afterward, from the United States Naval Academy. There has been a tendency in the 1900s, however, to commission officers from the ranks, a tradition that has continued into the post-Cold War era. There has also been, at least in previous times, friction between officers who were commissioned from civilian life or the Naval Academy and tended to serve long periods at Headquarters Marine Corps (so-called political marines) and those who came from the ranks and served primarily in the Fleet and the Fleet Marine Force (field marines). Given the modern-day commonality of educational experiences in commissioning programs and enlisted service, this friction has probably lessened, but the marines do continue to pride themselves on a style of aggressive leadership from the front that was exemplified by the former commandant general Alfred Gray, who had marines don battle dress uniforms on a regular basis to reinforce the idea of the corps as a fighting organization, not a military bureaucracy.

The Marine Corps currently numbers approximately 203,000 active-duty marines and 40,000 Marine Corps reservists. The marines are equipped with the latest small arms and heavy weapons, including tanks; amphibious assault vehicles; air defense, self-propelled, and stationary artillery; helicopters; and aircraft, the latter both of conventional and vertical/short takeoff and landing type. The marines are organized into Headquarters Marine Corps, the Operating Force, the Supporting Establishment, and the Marine Corps Reserve. In addition to their traditional military missions, the marines provide the guard detachments for nearly 150 U.S. embassies, consulates, and interests sections in more than 130 countries around the world. This force currently numbers approximately 1,000 marines, and this mission dates from the late 1940s. None of these missions will probably change very radically in the foreseeable future, though the

marines, like the other services, may endure cuts from lean budgetary times in the near future.

MARINE CORPS LEAGUE

Established in 1923, the Marine Corps League is a national organization serving the interests of current and former marines. In 1937, President Franklin Roosevelt approved the league as the only federally chartered organization of U.S. Marine Corps veterans. Today, an elected national commandant and 14 national staff officers run the organization from its headquarters in Fairfax, Virginia. It oversees more than 1,000 detachments spread throughout the United States and holds a yearly convention. This entry describes the history, focus, and activities of the Marine Corps League.

Demonstrating its close ties to the Marine Corps at its establishment, the first convention met for 2 days in 1924 at the Marine Barracks in Washington, D.C. The 26 delegates spent 1 day touring a Marine Corps base in Quantico, Virginia, attending modern warfare demonstrations and learning about developments in marine aviation.

Many of the delegates had served in World War I, when the corps swelled to more than 70,000 marines. After the war, marine veterans received few benefits and had difficulty finding employment. Many of these veterans joined a number of newly formed organizations, including the Veterans of Belleau Wood and even the Girl Marines of the American Legion. One of these organizations, the Marine Corps Veterans Association, would become the Marine League. Unlike many previous organizations, the league would seek to integrate veterans of other wars.

The experience of marine veterans in Buffalo reveals the evolutionary development of the association and, later, the league first at a local and then at a national level. In Buffalo, New York, marine veterans and local marine recruiters gathered in November 1919 to establish the Marine Veterans Club for their community. The detachment attended funerals for deceased marines whose bodies had been returned from France and helped relatives with funeral expenses. This local organization and others like it also provided other forms of mutual aid, including assisting returning marine veterans with finding employment and visiting wounded marines.

In 1922, local marine organizations primarily from the east coast gathered to establish the Marine Corps Veterans Association, first headed by Major S. W. Brewster, U.S. Marine Corps (Ret.). This association, which provided the first overarching framework to bind local groups together, evolved into the Marine League in June 1923 after veterans met at the Hotel Pennsylvania in New York City.

The Marine League differed somewhat from its counterpart, the similarly named Navy League, which began in 1902. While the Navy League similarly promoted the welfare of current and veteran sailors, it focused more on educating the public about the navy's importance, especially in regard to promoting a larger navy. In contrast, the Marine League organized itself more to provide for the welfare of marines as well as serve as a patriotic and social organization to promote the heritage and pride of individual members in the Marine Corps.

In the immediate years after World War I, the league used the marines' participation in the Battle of Belleau Wood as a means to celebrate the identity of marines. At its first meeting, for example, U.S. major general James Harbord spoke at 4:45, exactly 5 years after he received the order for marines to enter the battle at Belleau Wood. The league subsequently elected Harbord as the league's first honorary member; no wonder, given that he announced at the meeting that if he could begin his career again, he would choose the corps over the army.

In its early days, the league benefited from a close association with Commandant John A. Lejeune. As the head of the Marine Corps from 1920 to 1929, Lejeune promoted many rituals, such as the formal celebration of the institution's birthday. The league took a similar approach. To this day, local detachments follow a ritualistic meeting that adheres to the spirit of the corps' institutional culture in order to promote a shared camaraderie.

The Marine Corps as a whole also worked closely to help the league. Active-duty marines, particularly those associated with recruiting, promoted, supported, and even organized local detachments. The corps' publication for enlisted marines, *The Leatherneck*, regularly published news about the league's activities. At one point, the entire staff of *The Leatherneck* joined the Washington Detachment.

Interestingly, given the extent to which the league adopted the phrase "Once a Marine always a Marine," it had yet to avow the now common belief that there is no such thing as an ex-marine, only a former marine.

From 787 members in 1923, the league increased to more than 5,000 members by the time the U.S. entered World War II. By the War's end, the league had more than 25,000 members before tapering off to a rough average of between 10,000 and 15,000 members. Beginning in the 1980s, however, membership began rising. From just shy of 14,000 members in 1979, it has steadily gained in size. In 2005, it had more than 60,000 members. In contrast, the Navy League, which draws from a much larger potential pool of potential members, currently has only about 50,000 members. Membership in the Marine League is limited to those who have been honorably discharged from the Marine Corps and who have served more than 90 days. The league also welcomes those navy corpsmen who have served in the Fleet Marine Force.

The league works together with other military organizations and belongs to the Military Coalition, which consists of 28 organizations that serve those with current or prior affiliations to the military. It also informs and educates members about veterans benefits for which they might be eligible. The league has a number of subsidiary organizations. The Young Marines, established in 1958, became a part of the league in 1974. The Young Marines seeks to instill in young adults the corps' core values of discipline, teamwork, and leadership while promoting physical fitness. Other auxiliary organizations include the "Military Order of the Devil Dogs." Established in 1939, this self-proclaimed "Fun and Honor Society" of the league provides a smaller fraternal organization by invitation only. It requires the member to be nominated by two members of the Military Order of the Devil Dogs. Its emphasis on "devil dogs" celebrates the nickname that marines purportedly received from their German opponents during the Battle of Belleau Wood.

MARINE CORPS UNIVERSITY

The Marine Corps University (MCU) is the home for all U.S. Marine Corps professional military education. MCU is part of Education and Training Command under the Marine Corps Combat Development Command. Located in Quantico, Virginia, MCU encompasses the Marine Corps War College, the School of Advanced Warfighting, the Marine Corps Command and Staff College, the Expeditionary Warfare School, Enlisted Professional Military Education, and the School of Marine Air-Ground Task Force Logistics. MCU is also the parent entity of the Lejeune Leadership Institute (LLI), the U.S. Marine Corps History Division (HD), the General Alfred M. Gray Research Center (GRC),

and the National Museum of the Marine Corps (NMMC). MCU receives its accreditation through the Commission on Colleges of the Southern Association of Colleges and Schools and offers master's degrees in strategic studies, operational studies, and military studies. This entry describes the schools, institutions, programs, and missions of MCU.

Major General Commandant John A. Lejeune established the MCU's predecessor, the Marine Corps Institute, in 1920 as part of his Marine Corps education initiatives. In 1989, General Commandant Alfred M. Gray re-formed the Marine Corps Institute and created a professional education institution similar to those of the other military services. MCU was designed to attract civilian experts in military studies who could inspire a higher level of intellectualism within the ranks of the Marine Corps. Along with MCU, the commandant also established the Commandant's reading list, which dictated that marines at all levels must read a selection of the most influential studies in military doctrine, international affairs, and history.

The Marine Corps University educates men and women of all military services and government institutions, along with civilians and members of foreign militaries. At the Marine Corps War College, MCU trains senior-level military officers and civilians in broad-scale operations management, including joint military, interagency, and multinational environments. The Marine Corps War College is also responsible for educating these men and women in strategic studies at national and theater levels, as well as providing training in military support and national security. The Marine Corps Command and Staff College trains senior Marine Corps officers in military history, international and cultural studies, as well as strategic studies as part of the Master's in Military Studies Degree.

The Marine Corps University also offers programs and schools distinct to the Marine Corps' mission within the U.S. military. At the Expeditionary Warfare School, career-oriented military officers receive training in issues of command and control, ethics, operational culture, logistics, information technology, and leadership in environments specific to the Marine Corps' relationship and mission as America's expeditionary forces. These roles include combined arms, joint task force, and Marine Air-Ground Task Force. The Marine Air-Ground Task Force Logistics School is also part of MCU and

provides marines, Department of Defense personnel, and their civilian equivalents with the corps' premier training in the logistics of expeditionary warfare. Along with its mission-specific schools, the Marine Corps University also oversees Enlisted Professional Military Education, in which it provides military and cultural studies as well as leadership and tactical studies to provide the Marine Corps with highly trained noncommissioned officers. The MCU trains noncommissioned officers both at the main campus at Quantico, Virginia, and at Enlisted Professional Military Education academies worldwide.

The Marine Corps University also encompasses numerous satellite schools and program initiatives, including the LLI, GRC, and the HD. The LLI oversees leadership conferences and programs related to the ethics, morals, and laws of war. At the LLI, officers, enlisted personnel, and civilians take leadership courses and workshops on subjects such as communications, conflict resolution, and family readiness.

The Marine Corps University is also tasked with preserving and disseminating the history of the Marine Corps. The mission of the GRC is to support the students and educators at MCU through the storage, organization, and retrieval of current and historical archival materials. The GRC is the main repository of the official archives of the U.S. Marine Corps. The Special Collections and Archives Section maintains a massive collection of personal papers, command chronologies, and audiovisual resources. The GRC is also the location of the Library of the Marine Corps, which is the single most important repository for secondary sources either directly involving or related to the study of the U.S. Marine Corps.

The Marine Corps University also encompasses the HD. The HD is tasked with researching and writing the Marine Corps' official histories. Through the Histories, Reference, Oral History, Editing and Design, and Field History branches, the HD, now nearly a century old, is one of the premier locations for the study and dissemination of Marine Corps history as well as the corps' main institution for the collection and preservation of oral histories of marines of all ranks. The HD currently employs field historians to collect information from current operations around the world from those who experience it every day.

The Marine Corps University educates the leaders of the Marine Corps as they encounter all levels and methods of 21st-century warfare. The MCU also offers scholarships and training to nearly 70 foreign

military officers and scholars through the Foreign Professional Military Education Program (FPME). Overall, the Marine Corps University had 5,786 students as well as 365 faculty and staff for the year 2010 and maintained a budget of nearly \$65 million for the 2010 fiscal year.

MARINE GUARDS, EMBASSY

The U.S. Marine Corps Embassy Security Group (MCESG) deploys more than 1,300 Marine Security Guards (MSGs) to 148 diplomatic posts in 133 countries to provide security for U.S. diplomats and civilians abroad. Marine Corps embassy guards carry out a number of duties in cooperation with the U.S. Department of State, including security for U.S. embassies, consulates, and diplomatic missions, as well as protecting classified material and American civilians abroad. The MCESG headquarters is located in Quantico, Virginia, and provides leadership to nine regional commands throughout the world. The MCESG provides training, education, logistics, and assignments for MSGs abroad. This entry describes the history and functions of the MCESG.

The relationship between the U.S. Marine Corps and the State Department dates back to the earliest days of the American Republic. Along with their duties as shipboard security, U.S. Marines provided protection for U.S. diplomats abroad and acted under the direction of the State Department. Though the marines during this period were not recognized as "Embassy Marines," they nevertheless took part in sensitive missions in close association with U.S. diplomats. Marines not only provided security but also symbolized the growth of American power and influence in global affairs.

Due to their critical role in the 19th century, marines during this period became directly involved in events of lasting significance. The first documented excursion of marines with the State Department involved the guarding of the U.S. consul general Edward Stevens in his diplomatic mission to open relations with the newly established Haitian leader Toussaint L'Ouverture in 1799. A few years later, as part of the First Barbary War, marines also took part in the historic attack on the "shores of Tripoli" under the command of Consul General William Eaton at his post in Tunis. Marines continued aiding the State Department throughout the 19th century and into the 20th century, taking part in actions of war and peace. In 1905, marines represented the American diplomatic mission in France when they assisted in returning the remains of Revolutionary War hero John Paul Jones to the United States.

It was the Second World War, however, that would usher in the corps' direct relationship with the protection of U.S. embassies. Even prior to America's entry into the war, the State Department deployed marines to the U.S. Embassy in London, England. It was there that marines established themselves as the defenders of diplomatic officers and as security for the embassy. The marine detachment at the U.S. Embassy in London also faced intense combat even while the United States remained neutral. In 1940, these marines came under attack when German bombers began terrorizing the city of London during the infamous blitz.

The marines' esteemed conduct during the Second World War prompted the State Department to establish further protocol regarding the deployment of marines at U.S. embassies throughout the world. It was also thought that the marines' status as quickly deployable naval infantry added to their adaptability and flexibility, a necessity for an expanding State Department. In 1946, the State Department entered an agreement as part of Section 562 of the Foreign Service Act, in which any action concerning the protection of U.S. embassies must be coordinated through the Department of the Navy alone, thus ensuring marines their role as embassy guards. Two years later, this agreement was made official through the Memorandum of Agreement of 1948, which established the Marine Security Guard Program.

Throughout the second half of the 20th century, MSGs remained dedicated to their duties and as such became embroiled in America's best and

worst moments. Standing side by side with the State Department, Marine embassy guards became involved in incidents including the Fall of Saigon in 1975, the Iranian Hostage Crisis of 1979, the 1982 bombing of a Marine Corps barracks in Beirut, Lebanon, as well as repeated bombings and riots nearly every year all over the world. In the 21st century, particularly with the terrorist attacks of September 11, 2001, MSGs across the world continue to defend U.S. embassies and represent the United States even under severe scrutiny and danger. Eleven marines have died in the line of duty protecting U.S. embassies abroad. The Marine Security Guard Program officially changed its name to MCESG in 2007 and underwent administrative reorganization.

Typical deployment of marines to U.S. embassies consists of a minimum of one detachment commander and five MSGs. The number of marines deployed to each location differs for nearly every embassy in the world and is contingent on local threat levels and even the size of the structures in which they are stationed. MSGs are expected to maintain readiness 24 hours a day, 7 days a week, and they must always be prepared for quick reaction exercises, in which marines are required to respond to emergency tests based on historical situations. MSGs receive specialized training at MSG School. MSG School has one of the highest attrition rates of any Marine Corps school as MSGs are expected to meet the highest standards of the Marine Corps and the State Department.

MSGs in the Global War on Terrorism continue to conduct all assigned duties in coordination with the State Department. Operating in war zones such as Iraq and Afghanistan, however, has forced MSGs to adapt to changing conditions. With diplomatic officials in highly dangerous areas, the MCESG has grown and trained to meet these new demands. The addition of new posts in both war-torn countries also keeps MSGs close to the U.S. diplomatic effort as well as the combat that rages there every day.

MARINE ONE

Marine One is the moniker given to the presidential helicopter, managed by the U.S. Marine Corps, to facilitate short-distance presidential transport. Marine Two refers to the machine used for the vice president and other very important persons (VIPs) needing high-priority transportation. From Eisenhower to Obama, the size and expense of the executive helicopter fleet has ballooned, growing from a few off-the-shelf general purpose choppers to a planned fleet of controversial sophistication and cost. This entry discusses the history of presidential helicopters and the fleet in use today and looks at the controversy surrounding the recent proposals for a new design of presidential helicopter.

History

President Dwight D. Eisenhower was the first to use helicopters for short-distance presidential transport. Their use arose from an array of needs: greater speed, relief of the congestion of civilian traffic lanes that motorcades caused, and lower costs for presidential travel and security. Originally, two Bell UH-1s were used to fly him to Camp David and to his farm in Gettysburg. (“UH” refers to “utility helicopter”; in military situations, the UH-1 was a general purpose hauler of people and goods, including for medical evacuation.) The practicality of this impromptu solution led, over the next decade, to the creation of a fleet of helicopters with the sole purpose of transporting the president, members of his cabinet, foreign heads of state, and special executive personnel. Half a century later, presidential helicopters are flown in ahead of a trip, so the president has access to them anywhere he travels. Redundant aircraft are a security feature, and they increase the size of the fleet.

On January 1, 1958, the U.S. Army Executive Flight Detachment was activated and joined Marine Helicopter Squadron One. Their task was to develop emergency evacuation of the president, First Family, and key government officials, but their daily function was the transport of the president and White House VIPs. The army and marines shared transport responsibilities until 1976 when President Gerald R. Ford dismantled the Army Executive Flight Detachment, leaving Marine Helicopter Squadron One responsible for all helicopter operations from the White House.

The original machine used by both units came from the Connecticut-based Sikorsky Company; it was the Sikorsky CH-34-C—the military transport version of the Sikorsky S-58. In 1963, CH-3 helicopters joined the H-34s. The CH-3 is a modified version of the S-61 or U.S. Navy SH-3, “Sea King.” During the 1970s, the CH-34s were replaced with Bell UH-1-N, better known as Hueys. The UH-1-N was a “stretch” version of the original UH-1, with a second engine for power and reliability. It was in the 1970s that the primary Marine One helicopters became the UH-60N, a variant of Sikorsky’s UH-60 Black Hawk, and the model is still in use today. Presidential and VIP helicopters modify their alphanumeric designation from CH to VH to indicate their VIP status.

Recent Controversy

Following the events of September 11, 2001, Chief of Staff Andy Card initiated the revitalization of the presidential helicopter fleet. President George W. Bush spent a large portion of 9/11 in Air Force One—the fixed-wing aircraft—where issues of security, communication, defense, and mobility became evident. The 30-year-old helicopter fleet—11 VH-3D Sea Kings and 8 VH-60N Black Hawks—was ill equipped to meet the challenge of global terrorism. The need for more space, greater communication, and the ability to withstand the electromagnetic pulse of a nuclear attack; to support the president’s control of the nuclear forces; and to transport essential personnel over longer ranges added up to an imperative to redesign presidential helicopters for the 21st century.

For the first time, off-the-shelf military designs were considered inadequate, and an aircraft specifically designed for presidential transport was demanded at a new magnitude of cost. The escalating

requirements emerged between 2002 and 2004 when an official request for proposal was issued. Two corporations vied for the contract: Sikorsky and Lockheed Martin. Sikorsky stated that it should be the only choice since it was the “premier” U.S. firm, engineering, building, and maintaining the U.S. fleet since its inception. Lockheed Martin responded by pointing out that although some of its subcontractors were European—Italian and English—they were military allies in Iraq, and 90% of the jobs created by the contract would be allocated to U.S. workers. In November 2005, the contract was awarded to Lockheed Martin, interpreted by many military and civilian observers as a blow to U.S. manufacturing. Although the navy’s analysis indicated that the technical criteria, labor reliability, and historical precedent lay with Sikorsky, Lockheed Martin’s cabin design was based on the Augusta Westland prototype, a European machine. This cabin design is already in use in a number of ally nations of the North Atlantic Treaty Organization, delivering a smaller original production cost. The established prototype was thought to make development faster and cheaper and the program less risky. In 2004, the estimated contract cost for 28 helicopters, or the size of the presidential fleet, was \$6.1 billion.

In February 2009, the navy informed Congress that the VH-101, the Lockheed Martin prototype, overran its costs and had now reached \$11.2 billion. Both Congress and the Obama administration began a review of the contract. Connecticut’s congressional delegation asked that Sikorsky be offered an opportunity to rebid for the contract, arguing that Lockheed Martin’s lack of helicopter experience lay at the root of the cost overruns. In May 2009, the contract was cancelled. Although a few prototypes had been built at a cost of nearly \$6 billion, the administration’s desire to limit costs ended the contract. Immediate complaints arose in Congress, especially the New York delegation representing Owego, the construction and labor site.

In early 2010, the Pentagon released a new request for proposals. In April, Sikorsky and Lockheed Martin announced a decision to build the new presidential helicopters together based on the S-92 (Sikorsky) in order to provide a commonsense economic and technological solution for the next presidential aircraft. In May, Boeing also entered its bid to build the new VXX helicopter. Discussion over the past 2 years has created a compromise: the present

fleet will be renovated in two separate phases, the first finishes in 2016, the second in 2020. No new fleet will occur prior to 2024. Secretary of Defense Robert Gates argued that the VXX was a “poster child for an acquisition program gone seriously wrong” (in Andrea Shalal-Esa, “Pentagon Eyes Two Presidential Helicopter Models, *Reuters.com*, May 20, 2009), as designing a helicopter for routine presidential trips yet able to offer security during a major military threat resulted in continuous cost escalations.

MARSHALL, S. L. A.

Samuel Lyman Atwood (S. L. A.) Marshall (1900–1977), widely known as “SLAM,” was a journalist, self-proclaimed military historian, and military analyst who observed and reported on the actions of soldiers in battle in five separate conflicts (World Wars I and II, Korea, Vietnam, and the Sinai Conflict of 1956). He authored 29 publications, pioneered the afteraction combat interview to analyze the behavior of soldiers in combat, and introduced the controversial notion of a “ratio of fire” into the professional and popular lexicon. SLAM had a major impact on helping soldiers and others obtain a better understanding of what actually occurred in small units engaged in combat.

Born in Catskill, New York, in 1900, Marshall spent time in Colorado and California before settling in El Paso, Texas, and Detroit, Michigan, both of which would have major impacts on his life. He served in World War I as an enlisted man and briefly as an officer before returning to El Paso to work at a variety of jobs until finding his niche as a journalist for the *El Paso Herald* and the *Detroit News*, especially reporting on sports. Always writing for

the common man, Marshall's journalistic approach was characterized by clear and readable prose that tended to simplify events while also exploiting their interest and making them both understandable and engaging for the reader. Recalled to active duty in World War II as a major, Marshall joined the army's newly established Historical Section and applied his journalistic skills to study the performance of U.S. soldiers in combat in the Pacific and European theaters.

The Group Interview Technique and *Men Against Fire*

One of his first books, *Island Victory* (published in 1944), established him as an important contributor to the analysis of combat actions. In *Island Victory*, which addressed the fighting in the Marshall Islands, Marshall introduced his "group interview" technique and applied it to help gain a better understanding of the specific actions of six infantry companies in that fight. Marshall contended that his technique was "how the truth of battle is found," and the book was heralded by the *Infantry Journal* as a pioneering work in the study of combat. Moving to the European theater of operations in 1944, Marshall used his technique to help determine the actions of airborne units during Operation Overlord, which were particularly confusing. As a colonel and theater historian, Marshall finished out the war helping the army conduct the most extensive historical treatment ever attempted during the conduct of actual operations.

After the war, Marshall returned to civilian life (but remained in the Army Reserve) and published a synthesis of his observations in the 1947 book *Men Against Fire: The Problem of Battle Command in Future War*. In *Men Against Fire*, Marshall argued that "more and better fire" in battle would remain essential to victory in future conflicts, despite technological advances; he observed that fewer soldiers fired their weapons in combat during World War II than most people had thought. Marshall's book was initially well received, but his assertions regarding the number of soldiers who claimed to have fired their weapons in combat became the subject of intense disagreement among combat veterans and military historians. The debate surrounding his work centers on two fundamental issues: (1) his methodology and (2) his conclusions.

Methodology

Marshall studied the conduct of U.S. soldiers in battle using the "group interview" technique he pioneered. As described by Marshall, after researching a given battle and securing permission to conduct an interview, Marshall would gather a platoon- or company-sized unit together as quickly as the situation permitted after the completion of a combat action and conduct a group interview with as many participants as possible. He would begin the interview by discussing the unit's first actions and continue in chronological order until they had discussed the entire episode. Throughout the process, Marshall encouraged equal participation and discussion among all unit members, regardless of rank, and he would ask specific questions to ensure that the soldiers addressed all aspects of the battle. These interviews lasted between 4 and 8 hours, and Marshall tried to conduct them as close as possible to the battlefield on which they occurred. Marshall was not a trained historian, and the fundamental problems with Marshall's methodology were twofold: (1) the number of interviews he claimed to have conducted did not appear to be feasible and (2) he could not produce evidence of his interviews to document his findings.

Conclusions

Using his observation that between 15% and 25% of men in battle ever fired their weapons in combat during World War II, Marshall continued to publish his observations about the conduct of soldiers in future wars, opining that this number rose to approximately 55% in the Korean War and to an astonishing 90% in Vietnam. Marshall also appeared to take credit for this development, implying that he was largely responsible for doubling or tripling the ratio of fire for the entire U.S. Army. While a wide variety of authors past and present tend to corroborate Marshall's findings, many veterans viewed them as insults to their men and unit, openly disagreed with Marshall's findings, and challenged him to produce evidence to support his conclusions. Knowing that an exact accounting of the actual numbers of soldiers' firing in any given engagement would be difficult to determine, Marshall readily acknowledged that some soldiers may have been lying or exaggerating. He presented his observations as overall estimates of the soldiers' conduct in battle and never produced evidence to corroborate his findings.

Despite failing to accept the challenge directly, Marshall managed to establish and maintain a near-total dominance within this field of study. Few works other than his own address the ratio-of-fire issue specifically; and those that do tend to rely almost exclusively on Marshall's own findings for their support, making the debate somewhat circuitous. While Marshall's analyses were praised initially as conclusive, subsequent investigations have never located the cache of notebooks in which Marshall supposedly recorded the results of his interviews, leading current scholarship to discredit his findings. Nevertheless, some authors continue to lend support to Marshall's overall observations about the conduct of soldiers in combat.

Later Work

Marshall published two other works that had substantial impact on the armed forces and are worthy of note. As with *Men Against Fire*, his *The Soldier's Load and the Mobility of a Nation* continued to champion the role of the soldier on an increasingly technological battlefield by making explicit the connection between mobility in combat and the troops' will to fight. Marshall's *The Armed Forces Officer*, published in 1950 and not credited to him, served for more than 50 years as a basic primer for officership and leadership within the Department of Defense and has only recently been supplanted.

Marshall continued to contribute his observations about the conduct of soldiers in battle during the Sinai campaign of 1956 and the Vietnam War. He was promoted to brigadier general in the Army Reserve and died in December 1977. Throughout his life, his impact and influence on many aspects of ground combat was substantial, but his influence began to wane in the wake of challenges to his methodology and conclusions that began in the 1980s and continue to the present. Standing only 5 feet 5 inches tall, Marshall was nevertheless a giant in terms of the amount of influence he had and the controversy he created among the broader public regarding matters normally of interest to professional military men in the second half of the 20th century.

MEDIA RELATIONS, MILITARY

The necessity, if not obligation, of the American military to inform the American public and Congress of its missions and policies and of the news media to respond with approval or criticism has been a feature of U.S. democracy from the beginning. If the process has posed problems at times, it has generally been mutually beneficial. This entry examines news media–U.S. government relations from the Vietnam War to the present.

Tensions Between the U.S. Government and the Media

Communication between the two sides has been particularly difficult since the end of the Vietnam War. The United States began that conflict with a largely compliant press and a public affairs program that upheld military security without violating the rights of reporters. Between 1965 and 1968, reporters often criticized the violence of American tactics, the clandestine U.S. operations in Laos and Cambodia, and the ineptitude of the South Vietnamese armed forces, but the bulk of news reporting favored both the military and the American cause. A survey of television reporting prior to 1968 showed that spokesmen for the war predominated over critics on news programs by nearly six to one. Meanwhile, the credibility of the U.S. commander in Vietnam, General William C. Westmoreland, was so high that newsmen often replayed his background briefings word for word in their reports.

Circumstances soured in mid-1967, when Americans—under the influence of mounting taxes, casualties, and a host of questions rising from a flawed American strategy—turned against the war, and the administrations of Presidents Lyndon Baines Johnson and Richard M. Nixon began a prolonged withdrawal that stretched from 1968 to 1973. The press followed along, chronicling not only anti-war demonstrations in the United States but also a disastrous decline in morale among young soldiers in South Vietnam who had no wish to be the last to die in a conflict that seemed increasingly without purpose. Many in the military concluded erroneously that the coverage constituted nothing less than a stab in the back.

Mistrust seethed between the American military and news media during the years following the war. It remained largely unseen until October 25, 1983, when President Ronald Reagan deployed troops to the Caribbean island of Grenada to deter a supposed communist takeover. Concern for secrecy was so great that members of his administration declined to notify the press of the operation, and the military made no initial arrangements to deal with reporters in the field. As a result, the first officially sponsored team of reporters arrived in Grenada 2 days after the operation had begun and saw nothing of importance. The press received full access only on October 30, well after all fighting had ceased.

Following a storm of protest in the news media and well aware that the government needed to maintain cordial relations with the press in times of war to convey its messages credibly not only to the Americans but also to the people of the world, Secretary of Defense Caspar Weinberger convened a special panel composed of knowledgeable members of the news media and the military to recommend remedies that would be fair to the press while preserving military security. In its final report, the group suggested that every operational blueprint should include a public affairs plan and that the military should move the press to the scene of a conflict quickly. Since it was rarely possible to accommodate large numbers of journalists during the early stages of an attack, the panel suggested that an officially sponsored pool of correspondents could supply news to the rest of the press until full coverage was possible.

Although the Defense Department accepted those recommendations and established an official Pentagon press pool, it failed to take to heart the

commission's recommendation that every operational plan have a public affairs annex. As a result, when U.S. forces entered Panama in December 1989 to depose dictator Manuel Noriega, bad planning and unforeseen obstacles combined to create a public relations disaster. To preserve military security, the secretary of defense, Richard (Dick) Cheney, purposely called out the pool 5 hours late. Once in Panama, the group encountered more delays and worthless briefings. Transportation was virtually nonexistent, and the U.S. Southern Command's media center possessed too few fax and telephone lines to serve even the official pool, not to mention the hundreds of journalists who arrived over the days that followed. Under the circumstances, reporters became incensed when public affairs officers barred them from photographing the closed caskets of Americans killed in action. They also grew indignant when ABC News reporter Sam Donaldson, a big name in the news business, appeared to receive better treatment than they did.

When the buildup began for the Persian Gulf War in August 1990, the armed forces were determined to avoid the mistakes that had dogged their handling of the media in Grenada and Panama. They held regular news briefings, appointed high-ranking officers who could speak with authority as official spokespersons, and avoided exaggerated claims of progress. All those measures sat well with the press, but when ground combat neared in February 1991, the U.S. Command instituted a series of restrictions that seemed draconian to many. With nearly 1,000 correspondents vying to cover the war and up against a U.S. Army command that wanted as little to do as possible with the press, public affairs officers decided to force commanders to open up by establishing 25 five-person pools to cover events in the field. At the insistence of the U.S. command, each pool would have an official escort, and everything its members wrote would undergo security review, but the press would at least have some access to the fighting.

The situation deteriorated almost as soon as fighting began. Some escort officers took excessive advantage of their right to review press reports. Others stepped in front of news cameras when they objected to a line of questioning. Meanwhile, army units failed to transmit pool reports expeditiously, leading to charges from the press that the service was exercising censorship by delay. In contrast, ever

conscious of image, the U.S. Marines made it a point to cultivate press coverage by welcoming reporters. As a result, the army's stunningly successful left hook around the forces of Saddam Hussein went virtually unreported, while subsidiary operations by the marines in Kuwait received disproportionate coverage.

The army never forgot the lesson. During the U.S. interventions in Somalia from 1992 to 1994 and in Haiti in 1994, the armed forces exercised little control over the press because reporters were already at the scene and capable of operating without military assistance. In Bosnia and Herzegovina, however, the United States adopted an approach radically different from the one they had followed in the Persian Gulf. Assuming that journalists would develop a more positive attitude if they were thoroughly familiar with the troops and their mission, the army made reporters virtual members of the units they covered and abandoned all thought of censorship. Even so, on November 27, 1995, an embedded *Wall Street Journal* reporter overheard a brigade commander's pep talk to his troops. The article that followed was complimentary to the army and its men, but it noted that the officer, after telling Blacks in the unit to be wary of racist Croats, had added that U.S. forces would probably be in Croatia for far longer than the 1 year the administration of President Bill Clinton had promised. When the *New York Times* noted the next day that a senior U.S. official had condemned the officer's remarks, the article had a chilling effect on military-media relations not only in Bosnia and Herzegovina but around the world.

Reporting came full circle during the North Atlantic Treaty Organization–Yugoslav War of 1999. Reporters criticized the tight control of information at headquarters in Washington and Brussels; however, coverage of a relief mission in Albania was extensive and unfettered. With nothing to complain about but a shortage of hotel rooms, reporters characterized the effort as a shining example of military humanitarianism.

As the operation continued, the press speculated that a ground war was in the offing. A sizable number of reporters were embedded with units slated for movement to Kosovo, but when nothing occurred, only 30 of them remained with the troops. Given the lack of combat, many of the biggest news stories had to do with mishaps—for example, helicopter accidents, tanks mired in the mud, and the capture

by the Serbs of three soldiers who apparently lost their way. When the international peacekeeping force entered Kosovo, nonetheless, reporting from the field was generally favorable, leading both public affairs officers and journalists to conclude that the embedding had been a success.

September 11, 2001, and Beyond

With the end of the 20th century, it became increasingly evident that it was in the best interests of all belligerents in a war to explain not only why they were fighting but also why other nations should support their efforts. The increasing speed and diminishing cost of transmitting information—over the Internet, via satellite telephone and television, and through 24-hour global news programming—had so opened up the means of communication that no military endeavor could be deemed successful if it lacked sustained and coordinated public affairs efforts to inform the world.

In that light, although there was little initial need following the September 11, 2001, attacks on the World Trade Center to build a public consensus favoring war, President George W. Bush took pains in his speeches to solidify American and international support for a prolonged war. Emphasizing that he intended to hold all nations that supported terror accountable for the evil they caused, he asked the president of Afghanistan in public to surrender the leaders of the al Qaeda movement who had plotted the attack and then went to war against the nation's Taliban government when it declined to cooperate.

In the conflict that followed, the State Department hired an advertising executive, Charlotte Beers, to market the justice of the American cause to Muslim nations. The White House meanwhile established a Coalition Information Center to synchronize its evolving public affairs program and engaged a public relations firm, the Rendon Group, to promote democratic themes around the world. The Rendon Group also began to advise a new Defense Department agency, the Office of Strategic Influence, which sought to use a broad range of electronic media to flood closed societies with Western music, literature, and ideals. When allegations arose in the press, however, that the program was an Orwellian effort to spread false news abroad that could lead to military manipulation of public opinion at home, and high-level military public affairs officers warned

that the program might harm military credibility, the Department of Defense shut the office down. To counter continuing concerns that some among the military might attempt to confuse the enemy by using the American news media as an instrument of war to spread disinformation abroad, the Joint Chiefs of Staff released specific guidance in 2005 that emphasized that propaganda had no place in Defense Department public affairs programs. The policy, the deputy chief of U.S. Army Public Affairs, Brigadier General Mari K. Eder (2007), explained in a later article, went "to the heart of the morals and ethics that underpin our constitution" (p. 70).

A number of journalists traveled to Afghanistan, but they received little official assistance because the U.S. Special Forces were engaged in covert operations. As a result, although the Bush administration allowed reporters to visit aircraft carriers and Marine Corps amphibious ships, it afforded them little access to the pilots and troops who were doing the fighting. Seeking a broader view of events, some reporters chose to enter the field without military assistance. Although eight of them were killed in action, the American public seemed unfazed. Polls during 2001 and 2002 revealed that a majority supported their government's right to restrict press coverage in order to preserve operational security.

The possibility of military action against Iraq came to the forefront in early spring 2002, just as combat operations in Afghanistan seemed to be winding down. When media speculation fueled public conjecture that war was imminent, the coverage worked to the Bush administration's advantage by preparing American and world opinion for the likelihood that the fighting would soon shift into a new phase. By summer, while insisting that a decision one way or the other was yet to come, administration spokespersons began building a case for armed intervention: Iraq's leader, President Saddam Hussein, had connections to al Qaeda and was thus involved in the 9/11 attacks; his government was seeking nuclear capabilities; and his government possessed stockpiles of biological and chemical weapons, which it had already used on Iraq's Kurdish population and in an earlier war against Iran.

By February 2003, that campaign had achieved its effect. Polls showed that more than 70% of the American public backed the use of force. If the administration succeeded with the American public, however, nothing the United States said seemed

to have much effect in dispelling international concern. Instead, antiwar protests erupted in Great Britain, France, Germany, Morocco, Indonesia, and elsewhere. Reflecting the trend, Beers resigned on March 3, 2003, asserting that her attempts to gain Muslim support had been to no avail.

Two weeks later, the Bush administration moved against Iraq. During the conflict that followed, U.S. government spokespersons at home and abroad sought to allay Islamic concerns about the well-being of Iraq's people by emphasizing coalition efforts to provide humanitarian aid and publicizing pictures of Iraqis celebrating Saddam Hussein's fall. Playing on Muslim mistrust of U.S. intentions, Islamic media outlets responded by highlighting every mistake U.S. forces made and some they had not made. As the war progressed, moreover, no Iraqi nuclear capabilities or weapons of mass destruction surfaced.

Expecting success to speak for itself, U.S. military planners believed that an effort to embed reporters with U.S. forces would be an excellent way to ease the world's concerns while eliminating the frictions that had dogged military-media relations since Vietnam. The press reacted so well to the opportunity that hundreds of news outlets competed in a lottery for the right to participate in the program. The more than 760 reporters selected agreed to accept strict rules that banned all mention of topics such as ongoing missions, numbers of troops and aircraft involved in specific operations, rules of engagement, and intelligence collection methods and activities. Public affairs officers in Kuwait also registered some 2,200 unembedded reporters.

Critics within the media argued that some of the embedded correspondents suffered from extreme pro-American bias because of their close personal identifications with the troops. Concerns also arose that embedded correspondents lacked perspective and transmitted too narrow a view of the conflict. While expressing unease with the positive tone of some American reporting, news analysts nonetheless concluded that the decision to embed reporters had given journalists more access to this conflict than to any other since Vietnam. Although the reporting that resulted was sometimes narrow, the broad analyses that appeared in newspapers and on television often made up the difference.

The military, for their part, were largely satisfied with the program. At a September 2003 conference sponsored by the Army War College, representatives

from all the military services agreed that the presence of reporters at the scene had countered misinformation from militant Islamic sources while destroying the credibility of Saddam's war machine with the people of both Iraq and the world.

George W. Bush announced on May 1, 2003, that major combat operations had ended, but the remark was premature. Over the years that followed, insurgencies grew in both Afghanistan and Iraq that tested the ingenuity of both military planners and news executives. Following considerable trial and error, the military mounted surge efforts that showed considerable promise. By then, however, the traditional news media lacked the means to maintain the sort of coverage they had mounted at the beginning of the war. Although newspapers remained the main source of information, people were reading them online, free. With advertising revenues lagging as a result, many famous journals had gone under, and even the most successful were cutting back. As for television news, viewership for serious news programs was in serious decline, prompting broadcasters to feature lightheaded news that would attract audiences. In the end, although some 276 embedded reporters remained at the beginning of 2010, many of them represented online media rather than traditional news outlets. A number of them were independent bloggers with no employer to answer to but themselves.

What does the future hold for media-government relations? Only time will tell. It would be wise to remember, however, that even in wars where reporters possess the means for instant communication via satellite and cell phone, the military will have the upper hand because it will still control access to the battlefield. Even so, the news media will hardly be without advantage, for if they need the military and the government for the news they provide, official sources will need them just as much to attract support and to deter enemy propaganda by delivering factual, credible information both to the American people and to audiences around the world.

MEDICAL DISABILITY, VETERAN

The meaning of veterans' medical disabilities is not static and can change in a relatively short period of time, since disabilities are defined not only medically but also socially and politically. What disabilities deserve benefits? What disabilities are service related? How can we conclusively determine the cause of disease? These questions are pivotal in forming governmental policies and the political agenda of veterans service organizations, and answering them, one must refer to a variety of aspects: (a) social attitudes to wars and the armed forces, (b) economic conditions, (c) the number of disabled veterans, (d) the nation's political culture, and (e) opinions of

the medical professions. Focusing on these factors, this entry describes what the government defines as medical disability of veterans that it has a responsibility of providing care for.

Benefits for Veterans With Disabilities

Both the Veterans Health Administration and the Department of Veterans Affairs (VA) provide services for veterans with impairment, based on the philosophy that the state should fix the earning capacity of veterans or compensate the loss of such ability from a service-related origin. The Veterans Benefits Administration offers Vocational Rehabilitation & Employment programs for veterans having more than 10% service-connected disability rating, if they are discharged “under conditions other than dishonorable.” To obtain benefits, an applicant first meets a vocational rehabilitation counselor, who determines whether the veteran can be entitled to Vocational Rehabilitation & Employment services. If the veteran has a disability rating of more than 20% or a serious handicap to employment, the veteran and a vocational rehabilitation counselor work together to choose employment or independent living as the suitable goal of rehabilitation and select a program track leading to it. The basic period of rehabilitation eligibility is 12 years from the date of a veteran’s separation from the armed forces or the first notification of a service-connected disability rating by the VA.

Veterans with service-connected or non-service-connected disabilities who cannot afford private health services can also qualify for a pension and/or disability compensation. They need to have served at least 90 days of active military service, 1 day of which was during a wartime period, to qualify with non-service-connected disabilities and must not have been dishonorably discharged. Additionally, a surviving spouse and unmarried children of a deceased veteran may be eligible for death pension benefits.

Disability Rating and Presumption of Service Connection

Since the Continental Congress adopted the first national pension law of the United States in 1776, the evaluation of veterans’ disability has depended on the judgment of how individuals’ impairments limit their earning opportunities. The Department of

Defense (DOD) evaluates whether a wounded soldier or a soldier with a disease is able to continue active military service and, if not, rates his or her disabilities to establish the availability of compensation programs for the retiring service member. When the DOD judges that a soldier should be discharged because his or her disability makes service in the armed forces untenable, the soldier usually receives a VA disability rating. The VA then determines the degree of handicap, focusing on the veteran’s prospect for civilian employment, while using the rating schedule shared by the DOD. The VA reevaluates its ratings periodically.

The two separate disability evaluations of the DOD and the VA reflect the transfer of service personnel from the military field to the civilian field in the governmental jurisdiction, which often results in producing different ratings. The DOD has an incentive to lower the level of a veteran’s disabilities because a rating of less than 30% disability exempts the DOD from paying lifelong compensation for a disabled veteran who served for less than 20 years. For coordinating the two departments’ ratings and ensuring consistency, the DOD and the VA established the Integrated Pilot Disability Evaluation System in 2007. They later expanded the system beyond the National Capital Region, in which it was implemented first, by their agreement of 2009, to “improve the timeliness, effectiveness, transparency, and resource utilization in transitioning Service members from the military service to the VA” (Department of Defense and Department of Veterans Affairs, 2009, p. 1).

To further improve rating procedures, in 2007 reports from the Institute of Medicine (IOM) and the National Academies recommended that the VA include quality of life and disabilities not limited to employment handicaps into its criteria to more precisely evaluate the total effect of impairments on veterans’ lives.

A veteran needs to present that his or her disability originated in the armed service before receiving governmental care and benefits. It is, however, sometimes impossible to determine whether an individual’s disability has service connection. Difficulties in determining etiology in addition to insufficient medical and service records are the main causes. To compensate for a lack of ability to conclusively prove the connection between medical issues and military service, the VA introduced a legal mechanism called

presumptive decision making or simply “presumption.” This procedure provides for the certification of a veteran’s disabilities, even when a soldier cannot establish that his or her disability has a service-related origin, based on certain facts ordained by Congress or the VA such that a veteran acquired a certain disease during a defined period after being on a specific campaign. With the legal remedy via presumption, the VA avoids rejecting veterans who have a right to benefits.

Congress enacted the first presumption law in 1921 for neuropsychiatric disease and active pulmonary tuberculosis for Great War veterans. Today, the VA infers that various symptoms were caused by radiation exposures in Hiroshima and Nagasaki, nuclear experiments, exposure to Agent Orange in Vietnam, and service in the Persian Gulf area. Although it requested professional medical opinions from the IOM, the VA set the presumption provisions independently behind closed doors. The IOM criticized the VA for its lack of transparency and argued that the political pressure of veterans’ advocacy groups influenced the presumption-making process without due regard to scientific legitimacy.

Agent Orange and Gulf War Syndrome

Recent cases involving Vietnam and Gulf War veterans reveal how controversial it is to presume disabilities’ connection to military service. Herbicides such as Agent Orange (AO), used as a defoliant by the U.S. military forces in Vietnam, appeared to expose U.S. soldiers to toxic chemicals like dioxin. While some medical professionals remain skeptical about the causal association between AO and Vietnam veterans’ disabilities, multiple studies have indicated the possibility that high AO exposure triggers or abets various disorders, including cancer, heart disease, and diabetes. Fierce criticism of the VA erupted when it denied the connection between AO and diseases other than chloracne (a skin condition). Also, Vietnam veterans have brought a number of class action lawsuits since the late 1970s against manufacturers that produced AO. Facing the mounting cry for relief of veterans’ sufferings, Congress eventually passed the Agent Orange Act of 1991. The act mandated the VA care for veterans if the “evidence for the association [between the disease and AO exposure] is equal to or outweighs the credible evidence against the association” (<http://www7.nationalacademies.org/ocga/laws/PL102-4.asp>). This law

also ordered biennial reports by the IOM about veterans and AO.

Although studies are ongoing, it is difficult to determine how many veterans were exposed to AO in Vietnam. Additionally, the potential harms of AO on veterans’ health may surface in the future. In October 2009, VA secretary Eric K. Shinseki decided to add B cell leukemias, Parkinson’s disease, and ischemic heart disease to the list of health problems presumed to be associated with herbicides, based on the opinion of the IOM.

Medical problems experienced by Gulf War veterans since 1990 represent a more ambiguous and confusing example. The VA and other federal agencies have conducted research on certain symptoms of veterans who served in the Gulf during Operation Desert Shield, Operation Desert Storm, and Operation Iraqi Freedom. Symptoms include chronic fatigue, joint and muscle pain, memory and concentration problems, stomach and bowel problems, and loss of sexual drive. Today, these are referred to under the blanket designation of “Gulf War syndrome.” Various agents, such as vaccinations, nerve agent pretreatment sets, chemical warfare agents, depleted uranium ordnance, toxic fumes from burning oil wells, and organophosphate insecticides have been blamed, but there remains no specific set of symptoms and single cause to explain the diversity of disabilities among Gulf veterans. In fact, the international scientific and medical community agrees that there is not sufficient evidence to define these illnesses as unique. Nonetheless, Congress established a presumption for some of these symptoms, associating them with the toxic “environment” of the Gulf area by passing the Persian Gulf War Act and the Veterans Programs Enhancement Act in 1998. These acts did not designate the causative agent, a crucial difference with the case of AO in Vietnam. These acts were subsequently applied to Operation Iraqi Freedom veterans.

Scientists blame the formal recognition of the diffuse and unproven syndrome and compensation measures for Gulf veterans, pointing out that the same disorders are common among veterans of other wars and exist even among civilians. Yet, the administrative decision to compensate or give benefits for veterans’ disabilities cannot totally depend on any scientific criteria, in spite of physicians’ commitment to medical objectivity. In fact, the growing list of presumptive provisions since the 1990s reflects a social and political attention on the causal

association between veterans' disabilities and toxic exposure in the armed services.

Conclusion

Based on interviews with UK Gulf War veterans, the anthropologist Susie Kilshaw points out the necessity of seeing veterans' claims of illness in a social context, which gives them a way to explain their sufferings. According to Kilshaw, the concept of Gulf War syndrome provides a frame of interpretation by which veterans understand their diseases as an unidentified threat such as mad cow disease and genetically modified foods. For Kilshaw, these represent signs of declining faith in medicine and a lack of trust in government institutions. Information from the media, doctors, friends, and families convince returning veterans that their disabilities originated in their military service, unless definite causes for their symptoms existed. Veterans' conclusions are shaped by their cumulative knowledge of the government's chemical and toxic operations. If so, improving disclosure of the government's information, growing transparency of its operation, and strengthening its accountability may contribute to calming down veterans' unrest.

MEDICINE, MILITARY

The term *military medicine* denotes a specific field of medicine that focuses on caring for soldiers during war. Today, the military has approximately 39,000 combat medics who are responsible for directly administering treatment to military personnel. Their special training in emergency care is first-rate and has resulted in an increasingly high rate of injury survival. One of the primary goals of the Military Health System is to safeguard U.S. military personnel during times of war and peace. The U.S. military has historically been at the forefront of medical advancement. Since their introduction, military physicians have provided critical care and preventive medicine to all soldiers. Recently, the Military Health System began administering care to the relatives of military personnel. Moreover, military medicine has introduced the wider medical community to new technologies and practices. Military medicine has brought about some of the greatest medical breakthroughs, often through collaboration with civilian researchers. Their careful research has established effective mass casualty protocols, preventive medicine, and disease eradication.

Early Development of Military Medicine

During the period of the American Revolution, the social position of physicians began to change. Before

1775, each regiment had a surgeon on staff who accompanied it throughout its tours. Officers often came from the leisure class, while physicians were viewed as being slightly above enlisted personnel, granting physicians little authority. While the basic tenets of human anatomy were established, physicians still knew relatively little in modern medical terms, and their ability to heal the sick was limited. Surgeons, in contrast, were tasked with performing operations, including amputation and bullet extraction. Unlike physicians, surgeons were contracted to the military, their skills generally necessary only during periods of active conflict when bullet and shrapnel wounds necessitated treatment. Surgeons were viewed similar to cooks or blacksmiths—they performed an essential service, but did not have a position of authority within the military hierarchy.

In the years following the American Revolution, a number of medical advances took place. There was a much-needed overhaul of the military medical system that reorganized the pay schedule for physicians, and medical practice became rooted in science and the scientific method. In 1818, Secretary of War John C. Calhoun put forth legislation establishing a permanent army medical department. As its head, he chose Dr. Joseph Lovell, who initiated the methodical gathering of medical facts and standardized the admissions examinations for aspiring military surgeons. In 1834, Lovell, after years of effort, ultimately convinced Congress to compensate each army surgeon at the pay grade of major.

The high mortality rates of soldiers during the early months of the Civil War alarmed surgeons on both sides; however, the Union made the first concerted effort to save lives through medical technology. Charles Tripler and Jonathan Letterman, the medical directors of The Army of the Potomac, established a new evacuation system in an attempt to remove the sick and injured from the battlefield. They implemented new vaccination protocols, requiring all soldiers to receive vaccinations for smallpox, and oversaw quinine distribution to prevent malaria outbreaks. In addition, Tripler and Letterman built a system of subsidiary hospitals and stressed the importance of sanitation among soldiers to the Union officers. By the time of the Battle of Fredericksburg in December 1862, the Union's Medical Corps was superior to that of the Confederacy, which suffered from an ill-prepared medical staff and equipment shortages.

During the years after the Civil War (1866–1898), American medicine saw great change and modernization. Military physicians began incorporating the latest in medical theory and science, including Louis Pasteur's groundbreaking research concerning germs and disease, and Joseph Lister's method of antibacterial surgery. During this period, physicians in both the army and navy gradually began offering medical services to both sailors' and soldiers' family members.

During the Mexican-American War (1846–1848), the American Civil War (1861–1865), and the Spanish-American War (1898), "camp fevers" were widespread, especially among Union armies stationed in the southern areas. Between May 1, 1898, and April 30, 1899, 5,400 individuals died from "camp fevers," accounting for approximately 84% of deaths. "Camp fevers" were initially identified as a number of diseases, including typhoid, malaria, yellow fever, and typhomalaria. During the Spanish-American War of 1898, Captain Walter Reed established through microscopic analysis of blood that the primary cause was typhoid, a bacterial disease that can be stopped by correct use of sanitary camp methods. Unfortunately, U.S. medical officers—political appointees—had little knowledge of suitable sanitation measures; however, in 1909, Frederick F. Russell, a U.S. Army physician, developed a typhoid vaccine that was introduced into the army in 1909 and made mandatory for all military personnel in 1911.

The Medical Reserve Corps was created in 1908 as an agency separate from the National Guard. In addition, a Veterinary Corps was added to the medical department. Veterinarians were skilled in taking care of horses and mules, the primary animals used by the military. Moreover, veterinarians were indispensable in the examination of meat for the purpose of consumption. An arrangement was made with the American Red Cross to provide nurses in times of crisis. The social status of military physicians rose to new heights in 1910, when President William Howard Taft chose Leonard Wood, a Harvard-trained physician who served as an army physician, as Army Chief of Staff.

The Era of the World Wars

On entering World War I, the United States was able to implement many modernizations and improvements to medical protocols that proved essential in the fight against the Central Powers. One initial

difficulty revolved around combat aviation. Shortly after America entered the war on April 6, 1917, the military realized that a large number of pilots were dying from flight-related mishaps rather than in attacks by German planes. On investigating, army physicians found that pilots flew to the point of collapse. A new specialty, flight surgery, was established. These experts emphasized the importance of adequate rest periods between flights. The extensive use of poison gas led to the formation of movable degassing units that functioned under the direction of army physicians and supplied bathing systems and new uniforms. Widespread availability of the typhus vaccine dramatically reduced incidence of that disease during the war, and ongoing research into a tetanus vaccine bore fruit by 1924, a particular boon to soldiers. In France, American military medicine introduced a new triage system, allowing physicians to treat the sickest patients first. The injured were organized to prioritize life-saving care depending on that individual's likelihood of survival. The military also began to establish laboratories with army hospitals that aided in speedy diagnosis; likewise, X-ray machines became common in military hospitals throughout the country. The single greatest achievement of the American military during these years was the institution of blood transfusions to decrease the lethal consequences of shock and blood loss among injured personnel.

During the interwar years from 1918 to 1939, civilian medicine greatly affected military medical protocols through the development of specializations, such as cardiology, neurology, and orthopedics. During the 1920s, civilian physicians began to earn more money in the private sector, and as a result, it became more difficult to recruit physicians to the military health service. The Veterans Administration, an independent governmental organization established in 1930, aided in the recruitment of physicians by expanding employment opportunities and supporting increased pay scales, as the Veterans Administration began to offer medical treatment for veterans. The army and the navy created research centers studying common problems facing aircrews, including the effects of life-threateningly cold temperatures. Harry G. Armstrong, a captain in the U.S. Army Air Corps, researched embolism and found that the single most critical element in its development were nitrogen bubbles forming in a pilot's blood while flying at high altitudes.

In New London, Connecticut, the navy created a medical program researching submarine medicine, whose primary purpose was to have skilled physicians and corpsmen attached to submarine units. In addition, individuals graduating from the submarine program aided in the creation of lifesaving underwater breathing apparatuses for use in emergency evacuations.

During World War II, the United States was again able to implement cutting-edge medical technology. The interwar creation of quinacrine, a new prophylaxis to treat and prevent malaria, allowed medical professionals to dramatically reduce incidents of malaria—particularly vital during Pacific Island-hopping campaigns. In addition, the creation of penicillin greatly aided individuals suffering from serious wounds overcome infection.

Advancements in lifesaving technologies are well illustrated in the navy's Landing Ship, Tank (LST), which assisted in amphibious warfare operations by safely carrying a great number of soldiers and supplies to and from battle sites. With a little rearranging, LSTs became hospital ships. The powerful insecticide dichlorodiphenyltrichloroethane (DDT) was used by the military to control a severe epidemic of typhus in Italy and malaria in the Pacific.

The Cold War

During the Cold War (1947–1991), American military medicine continually adapted to civilian benchmarks, working to recruit military medical personnel in the face of rapidly rising salaries in the civilian sector while increasing the number of noteworthy developments for the medical field. Both the army and the navy launched residency programs in military hospitals intended to meet the standards required for practice in civilian specialties. Dependent care restrictions were reduced by the 1956 Dependents Medical Care Program, which allowed for utilization of, and reimbursement for, civilian health care when military resources were unavailable. Recruitment problems were improved through the 1972 Health Profession Scholarship Program, which offered qualified individuals the funds to attend medical school, as well as a monthly stipend for agreeing to serve in the military for a specified period. Another improvement centered on the Nurse Corps, which became a recognized subdivision of the military, with commissions awarded on a permanent basis.

Recent Advances in Military Medicine

During the Persian Gulf War, August 2, 1990, to February 28, 1991, military medicine protocols adapted to a shortage of physicians by creating an intricate personnel hierarchy that functioned under the watchful eye of physicians. When the U.S. Army went to Saudi Arabia, more than 24,000 of those deployed were medical personnel. Approximately 3,000 were licensed physicians and dentists. Additional health care workers included nurses and medical technicians. These individuals performed many of the tasks associated with military medicine.

In the most recent U.S. military engagements, the Afghanistan and Iraq Wars, a major problem confronting the medical community has been the widespread proliferation of traumatic brain injury (TBI). Estimates place the number of soldiers affected by TBI since the beginning of the Afghanistan and Iraq conflicts in 2001 and 2003, respectively, at more than 250,000. Of these, it is believed that up to 90,000 individuals exhibit signs and symptoms indicating the need for long-term care.

In Afghanistan and Iraq, military physicians have struggled with the increased number of head injuries, especially since the overall death rate for soldiers has dropped to an all-time low. Technological advances in body armor better protect soldiers from injuries to the chest and brain during explosions. The 1996 adoption of the Tactical Combat Casualty Care system created new trauma training protocols to further decrease death rates from nonlethal injuries. Moreover, both military and civilian physicians have greater knowledge regarding the treatment of closed head injuries.

While trauma care has kept up with the demands of the military, nongovernmental organizations and the Veterans Administration play a key role in bettering the lives of soldiers who survive with increasingly severe wounds. Improvised explosive devices have come to play a central role in disfiguring soldiers, with injuries often including second- and third-degree burns and amputation. Advancing technologies in cosmetic and reconstructive surgery aid soldiers with skin grafts and the removal of burnt skin. Many soldiers require amputation of limbs. Advances in orthopedics and prosthetic limbs allow wounded soldiers to regain as much normalcy as possible. Additionally, nonprofit organizations like the Wounded Warrior Project works with injured soldiers to help them adjust to their new lives postinjury.

Contemporary advances have also extended into the realm of mental health. Although post-traumatic stress disorder (PTSD) was officially recognized in the *DSM-III* in 1980, in recent years, the military has worked to clarify and simplify the diagnosis of PTSD among veterans, especially in light of high rates of PTSD among those who have served in Afghanistan and Iraq. Researchers have discovered that behaviors exhibited by someone with PTSD often parallel those of someone with a minor TBI. Magnetic resonance imaging may be used in the diagnostic stage, allowing physicians to chart the compression of alterations in the brain after a concussion. Symptoms include sleep disturbances, headaches, memory problems, and mood swings. Military medicine uses a variety of different types of therapy to address these issues. For mild cases of TBI and PTSD, treatment plans include the ancient Chinese practice of acupuncture. Other treatments for PTSD include cognitive, exposure, and virtual reality therapies and various medications.

Unfortunately, the military has seen a drastic rise in the rate of suicides and attempted suicides among active-duty soldiers since 2001. As more soldiers ask for access to counseling in theater, the Pentagon has reminded commanding officers that it is their responsibility not to stigmatize those seeking help. This is an essential reminder, considering that the rate of combat deaths for 2012 was eclipsed by suicides as of June among active-duty service members. While access to counseling is available, the military is working to tackle negative stigmas associated with seeking psychological help.

MEDICINE, VETERANS

American veterans can receive a wide range of medical care services from federal and state governments. Although they can choose health care programs from the Department of Defense under specific conditions, this entry focuses on the federal service provider that exclusively treats former soldiers and their families—the Department of Veterans Affairs (VA).

Historical Overview

There is no record of a federal hospital giving medical care to veterans as its primary purpose before the First World War other than incidental medical facilities in the custodial institutions founded in 1865 for the indigent and/or elderly disabled Union soldiers of the Civil War (i.e., the National Home for Disabled Volunteer Soldiers). When the War Risk Insurance Act of 1917 gave monetary support to disabled Great War veterans and survivors of dead soldiers, it also mentioned the hospital care and vocational rehabilitation programs. In 1921, vocational rehabilitation programs of the Federal Board for Vocational Education and Public Health Service Hospitals moved into the Veterans' Bureau to gather the administration of all federal benefits for the World War veterans under a sole agency. Besides, construction plans of new veterans' hospitals had already started. Yet the growing number of veteran's hospitals, admission of non-service-related patients, and the resultant increase of costs for administration led to the criticism against the Veterans' Bureau from the perspective of economy. Thus, the

Economy Act of 1933 cut the budget of the VA's Veterans Administration (VA, the successor of the Veterans' Bureau) under the turmoil of the first 100 days of the New Deal. As a result, construction of new VA hospitals stopped until the appropriation of \$21 million by Congress in 1935 and the approval of the construction policy by the administration of Franklin D. Roosevelt in 1937.

The health care needs of World War II veterans exceeded the moderate increase in the number of VA facilities and its personnel. Pressed by public revelation of deficiencies both in quantity and quality of services at VA hospitals, government officials sought to improve their health care programs by affiliating with recent developments in medical technology in research universities. According to the VA's requests, heads of medical departments formed the Dean's Committees, which accredited and furnished part-time and full-time doctors and other health care specialists to each VA hospital. This equipped the VA's medical system with the most recent technology and made its health care services catch up to the standard of other federal facilities. In return, the VA provided universities with fiscal supports and spaces for training, education, and research. Physicians held their superiority in decision making over lay officials after an intensive struggle to reconfigure VA facilities into institutions for medical care, not primarily as places for long-term custodial care. The VA's hospital system became a large military-academy complex in the medical field.

The late 1940s were also the period of reform in terms of racial discrimination. Until the upsurge of the civil rights movement after World War II, the VA hospitals had segregated African American patients in hospitals and provided them spaces, services, and staffs inferior to ones for White veterans except in the Tuskegee Veterans Hospital founded for the care of Black veterans. When the Truman administration applied to the VA hospitals Executive Orders 9980 and 9981, which prohibited racial discrimination in federal employment and the segregation of the armed services in 1948, accommodations were integrated.

Despite the modernization and the reform of the VA's hospital system after World War II, criticisms of health care programs of the VA did not disappear. Especially during and after the Vietnam War, popular media and public discussions on medical care for veterans were dominated by tragic stories of returning disabled soldiers and scandalous conditions of VA hospitals—for example, Ron Kovic's memoir

Born on the Fourth of July (1976). An antiwar organization of veterans, Vietnam Veterans Against the War, claimed the improvement of VA hospitals as one of its agendas. Furthermore, recognizing mental ailments prevailing among Vietnam veterans, including posttraumatic stress disorder (PTSD), physicians pointed out the shortage of mental health care personnel and facilities as the most acute problem of the VA's hospital system. In 1977, the National Research Council of the National Academies of Sciences submitted to Congress the report titled "Health Care for American Veterans." The report recommended reducing inpatient care for psychiatric disabled veterans by increasing the outpatient care facilities and personnel and expanding corroboration between VA services and community mental health resources. As a response to the anticipation of increasing veteran mental problems, the Veterans Health Care Amendments of 1979 established the psychological counseling system and alcohol and drug programs for Vietnam veterans. In addition, it authorized the VA to contract for private health providers when emergency medical care was needed by veterans.

Recent Developments

Following the reconfiguration of the VA into a department with a cabinet-level position in 1989, medical and health care activities for veterans came under the jurisdiction of the Veterans Health Administration (VHA). The creation of a new government department and the VHA within it did not allay the concerns raised by the veterans' service organizations and the public. With regard to the quality of health care offered to veterans, the VHA's hospital-centered structure emphasizing acute care was seen as inadequate for the needs of patients with chronic disorders needing primary care. Meanwhile, the declining percentage of younger veterans with service-related disabilities in the benefit recipients as a whole had been undermining the legitimacy of maintaining the large personnel and facilities of the VHA since the 1970s. In terms of budget, the pressure for reducing public expenditures for health care grew. The expectation of more responsibility by individual veterans in the maintenance of their own health expanded. The spread of "managed care" pressed the application of the system in federal hospitals.

In 1994, the undersecretary of health of the VA, Kenneth W. Kizer, started reform efforts of VHA

programs and public relations activities for the purpose of improving the agency's reputations. Main components of the reform included expansion of outpatient care capacities, accommodation to the needs of the growing number of elderly veterans, and improvement of accessibility to the VHA facilities in the face of the obvious number of empty beds in veterans' hospitals. Kizer and succeeding undersecretaries had to manage these agendas to adjust to the budget-cutting demand that itself was the major cause of reform efforts. For such a purpose, duplication of services between hospitals and other facilities was a major deficiency that needed to be fixed. Thus, the Veterans Health Care Eligibility Reform Act of 1996 enabled the VHA to restructure its health care system through establishing the Veterans Integrated Service Networks, which constituted 22 geographical service areas of the agency. Using allocated budgets, each Veterans Integrated Service Network coordinated its resources and workforce among its facilities and discouraged competition between them. The Electronic Health Record was another significant tool in efforts to make health care activities more rational. Via the technological update of interface in 1997, the Computerized Patient Record System greatly improved the efficiency and expediency of medical records for physicians. Furthermore, the Computerized Patient Record System contributed to reducing the rate of adverse drug events.

Due to these reform initiatives since the mid-1990s, the health care quality of the VHA improved greatly. In comparison to other health care services of the federal government, such as Medicare, there is a general feeling that the health care cost of the VHA per patient is cheaper and its protocols are more efficient. Today, the VHA, America's largest body of integrated public health care activities, is regarded as the most successful among health care systems in the United States, although the warrant for growing total budget remains.

Services Today

The VHA provides a comprehensive health care for veterans in 153 medical centers and more than 800 community-based outpatient clinics. The administration of this enormous public health care system is the biggest task of the VA. In Fiscal Year 2008, of the 250,000 employees of the VA, 222,000 were the personnel for medical care and research. In the same fiscal

year, the budget for medical care and research purposes was \$43 billion and \$500 million, respectively, while the total budget of the VA was \$90 billion.

Although medical centers provide a wide range of traditional hospital-based services for ex-soldiers, community-based outpatient clinics are facilities for easier access by veterans from their homes to the most common outpatient services, even in rural areas. From a historical perspective, community-based outpatient clinics are the complement of VA hospitals, which were concentrated in urban areas after World War II to be near research universities. In addition to hospitals and clinics, there are 48 VA domiciliaries that care for veterans in a “homelike environment.” Community Living Centers play a role like that of nursing homes. Furthermore, the VA provides grants-in-aid for the construction and acquisition of veterans homes by each state and for payment of per diem cost of individual veterans in state homes (i.e., in the State Veterans Home Program). Plus, about 230 Vets Centers provide readjustment counseling and outreach services to veterans and their families.

All veterans of the U.S. Army, U.S. Navy, U.S. Air Force, Marines, or Coast Guard are potentially eligible for health care services from the VHA if discharged “under conditions other than dishonorable.” Also, Reservists and National Guard members who were called to active duty by a federal executive order or were left with a service-connected disability may qualify for VA health care benefits. Following the submission of a form available on the VA’s website, an applicant will be examined for his or her eligibility by the VA.

The VA offers family members of veterans comprehensive health care programs, such as Civilian Health and Medical Programs of VA. The application form is available on the VA’s website. In this program, the VA shares the cost of covered services and supplies with eligible beneficiaries. If a veteran is rated permanently and totally disabled by his or her service by a VA regional office, whether dead or alive, or if he or she died from a service-connected disability, the veteran’s spouse and children are eligible for Civilian Health and Medical Programs. In limited cases, the surviving spouse and children of a military member who died in the line of duty are eligible too, but most of them can apply for TRICARE from the Department of Defense instead of Civilian Health and Medical Programs.

Programs of the VHA have been updated to tackle health problems inherent to returning soldiers as depressive legacies of recent wars:

- The environmental warfare in Vietnam exposed soldiers to herbicides such as Agent Orange. Congress passed the Agent Orange Act in 1991, mandating care for veterans known to be exposed to Agent Orange. Today, the VA recognizes certain diseases of veterans—chronic lymphocytic leukemia, multiple myeloma, prostate cancer, and others—and birth defects of children of veterans as associated with exposure to herbicides.

- The VA and other federal agencies have been conducting research on certain symptoms among veterans who served in the Gulf during Operation Desert Shield, Operation Desert Storm, and Operation Iraqi Freedom. They include neurological disorders and are bracketed as Gulf War syndrome. Although the VA did not determine the cause of symptoms, it recognized some of them as associated with military service in the Gulf.

- Neurological and psychiatric cases among veterans are increasing as the United States conducts the Global War on Terrorism in the early 21st century. A recent study estimated that 18.5% of soldiers who returned from Operation Iraqi Freedom and Operation Enduring Freedom met criteria on a survey of probable PTSD and depression. Many of them do not receive the mental health care needed to remit their symptoms.

- As a part of the Health Care for Reentry Veterans, the VA provides veterans referrals and linkages to medical, psychiatric, and social services to prevent homelessness, help readjustment into communities, and decrease the reincarceration of those leaving prison.

- For care of military sexual trauma and PTSD of both female and male veterans, every VA facility has a designated military sexual trauma coordinator who can help them find and access VA services, state and federal benefits, and community resources.

- The VA administers the Veterans Chat Service by trained counselors on the VA National Suicide Prevention Hotline.

Outstanding Problems

Despite recent development of the VHA's health programs, there remain many challenges. Unmet mental health care needs of Operation Enduring Freedom and Operation Iraqi Freedom veterans are among such issues. Because they are widely dispersed around the country, it may be difficult to access a VHA's mental care facility and see a specialist, especially in rural areas, and sometimes these facilities are oriented toward caring for older chronic patients from former wars. For increasing accessibility, concentration of physicians in urban areas and an inadequate veterans' budget are significant bottlenecks. To fill gaps between needs and provisions, the VHA and private service providers are cooperating to expand the utilization of community mental health centers in the care of veterans. For the quality improvement of the mental health of recent war veterans, some scholars point out further demands for encouragement of veterans with potential needs of care to come to medical facilities, for increasing the workforce capacity of the VHA and community health care providers, and for evidence-based treatment for PTSD and depression, including psychotherapy and medications.

These visions require the VA to expend further cost for care and cooperation with private and community health providers. Yet, it is not clear whether the VA can ensure a budget sufficient for the development of medical care for veterans. Veterans' health care is at the discretion of Congress, unlike entitlements such as Medicare and Medicaid. While the latter can automatically claim their increasing expenditures from the federal government, Congress annually decides the size of the budget appropriated to the former. When the total cost for health care programs increases, the pressure for economy can lead to focus on discretionary programs such as veterans' medicine. This situation necessitates the limitation of eligibility for VHA health care to poor veterans and those with service-related disabilities. As a result, VA patients can become sicker and more indigent than the general population.

Conclusion

Historically, health care services for veterans have been distinguished from health care services for the rest of the citizens of the United States. This distinctive status of medicine for former soldiers created a

paradoxical situation. For keeping its own health, the United States seems reliant on the private and market sectors to the largest degree among industrialized nations. Nevertheless, it possesses one of the biggest public medical care agencies in the world. Professional management of the VA's program by physicians enabled such first-class health care for returning veterans. Furthermore, it is an irony that despite criticisms of the VHA based on the ideological revulsion of state medicine, reforms resulted in the establishment of the most efficient and prestigious VHA. The VA has to address diverse and changing health needs of both younger veterans readjusting into communities and an aging group of earlier war veterans gradually leaving society, plus their family members. It cares for almost all generations in America. The VA's medical care activities are a distinct contradiction in America's self-image as a country of private medicine.

MEXICAN-AMERICAN WAR

This conflict, fought between the United States of America and the United Mexican States from April 25, 1846, to February 2, 1848, resulted in Mexico ceding to the Americans the area that became the present-day states of Texas, New Mexico, Arizona, Nevada, and California in return for \$15 million and assurances of the rights of Mexican citizens remaining in the ceded territories. The history of the conflict, discussed in this entry, falls in seven segments: (1) the background, (2) military capabilities, (3) the northern and western battles, (4) the battles in central Mexico, (5) the negotiations, (6) lessons learned, and (7) historical interpretations.

Background

In 1821, a newly independent Mexico inherited the boundaries set in the 1819 Adam-Onís Treaty signed by the United States and Spain. However, earlier that year, the last Spanish authorities in Texas granted the American empresario Moses Austin permission to establish a colony of 300 families. The Spanish hoped that the admission and assimilation of such immigrants would create a barrier against future filibusterers and other annexationists seeking to expand U.S. territory. Also, the additional settlements in Texas could provide a barrier to incessant Indian raids.

On Austin's death in 1821, the grant passed on to his son, Stephen Fuller Austin. Under his leadership, American immigration increased. On March 2, 1836, the colonists declared Texas independent of Mexico. In their Declaration of Independence, they accused the Mexican government of violating fundamental and inalienable liberties. The colonists identified the precipitating cause of their revolt as

the violent February 27, 1836, overthrow of the Mexican government by Conservatives intent on repealing the less conservative 1824 constitution.

However, many Mexican historians argue that the colonists never intended to assimilate into Mexican society and instead used the tumult created by that 1836 coup d'état as an excuse to secede. General Antonio López de Santa Anna led forces sent north to crush the rebellion. Following the destruction of Texan garrisons at the Alamo and Goliad, he divided his forces into five columns. Leading one of the columns northeastward past present-day Houston, he and some 1,200 men were defeated at San Jacinto by Texans under General Sam Houston.

Although Santa Anna acknowledged Texas's independence following the battle, the Mexican government refused to do so. Given the parlous state of Mexico's treasury and internal warfare, that nation made only one effort at reconquest. This ended in a Texan victory at the Battle of Saldado Creek (September 18, 1842).

Subsequently, Mexico branded the 1845 U.S. decision to admit Texas into the Union as an act of war. Once U.S. troops entered Texas and then began constructing Fort Texas opposite Matamoros, an armed clash of some sort was inevitable. The senior leadership of Mexico's army harbored no illusions about their nation's military strength and hoped to confine the conflict to the border regions.

Military Capabilities

The two armies differed considerably in their structure, training, and equipment. At the start of the war, the U.S. Army mustered 8,500 men concentrated primarily in the infantry and artillery branches.

Although the American cannons and mortars varied from state-of-the-art pieces to some used during the U.S. War of Independence, the recently acquired 1842 family of artillery weapons proved critical to the Americans' success on a number of occasions. Designed and produced in the United States, these cannons and mortars utilized the latest alloys. As such, the 6- and 12-pound pieces could be rapidly moved by horse from one part of the battlefield to another. At the Battle of Buena Vista, this mobility enabled the artillery to deploy quickly enough to meet *en serie* thrusts from a Mexican force that outnumbered General Zachary Taylor's forces by more than three to one. Also, the destructive power

of the American artillery enabled U.S. commanders to significantly weaken any fixed point, no matter how heavily fortified, that they wish to take.

Overall, the quality of the officers and enlisted ranks was excellent. Both Taylor and General Winfield Scott were officers of proven competence and their subordinate commanders mostly were graduates of the United States Military Academy at West Point. The enlisted men were trained to a high standard and stood well prepared for their responsibilities.

However, three weaknesses marred this otherwise impressive picture. First, the cavalry arm proved too small to either secure the long supply lines that would extend from Veracruz to Mexico City or hunt down and destroy Mexico's mounted partisans. At first, both Taylor in northern Mexico and Scott in central Mexico addressed this problem by employing Texas Rangers in a scouting and counter guerrilla capacity. They did not prove wholly successful in either case. Also, their brutal treatment of civilians alienated many Mexicans.

Second, the volunteer regiments appended to the regular army by Congress proved less effective than did the regular forces. While the regulars completed a required, comprehensive, and consistent program of training, the preparation of the volunteers varied in quality from one unit to the next. Often, their officers owed their position to election by their troops rather than to their ability to command. Soldiers ill prepared for war led by officers untrained or unsuited to command created problems both on and off the battlefield. The worst single incident occurred at the Battle of Buena Vista, where the Arkansas Volunteer Regiment broke and fled in the face of an advancing enemy.

Last, the trust and openness necessary to establish the most productive working relationships between a commander in chief and his senior generals did not exist. President James Knox Polk, a Democrat, disliked and distrusted both Scott and Taylor because they publically identified with the opposing Whig party and because he thought they harbored presidential ambitions. Consequently, the success and popularity that the two generals achieved by virtue of repeated victories made the president fear them even more.

In return, both generals eventually saw Polk as a man bent on their destruction. Taylor bitterly concluded that the president's decision to invade central

Mexico by sea rather than by allowing his own forces to move south was motivated by Polk's desire to prevent him from gaining further success. Scott, who was cashiered by Polk, no doubt shared such sentiments.

As a result, communication between the commander in chief and the generals proved barren. When Scott argued that the result of a continued U.S. occupation most likely would be collapse of Mexico's government and when Taylor suggested an end to the occupation by unilaterally withdrawing to the Rio Grande, Polk rejected their opinions and ordered an expanded occupation. Fortunately for the Americans, the Mexican army confronted greater problems.

On paper, Mexico's army numbered more than 30,000 men. However, many of these soldiers existed only on paper, with corrupt civilian and military officials pocketing their wages. Those Mexican forces that did take the field proved to be in far poorer condition than their American counterparts. The worst deficiencies existed in the officer corps.

From 1821 onward, the Mexican army's officers became involved in the violent overthrow of numerous governments. While many of them accumulated considerable experience in shooting fellow Mexicans, they were not professionals in the sense that this term was understood in the United States or Western Europe. Also, to a far greater extent than the American foe, this army had been burdened by officers holding rank on the basis of political influence rather than competence. These men would be of as little value to Mexico's war effort as the one politically appointed senior American commander (General Gideon Johnson Pillow) was to the American cause.

Additionally, the dire state of Mexican finances and widespread corruption meant that the army lacked funds to purchase modern weaponry or adequate supplies. That shortcoming would be evident in the field throughout the war. At the start of the conflict, General Mariano Arista reported that a lack of supplies severely limited his movement along the northern frontier. The powder provided to his artillerymen proved to be of such inferior quality that at the Battle of Palo Alto their shot rarely reached the American lines. During the later battles for Mexico City, General Pedro María de Anaya surrendered at Churubusco because he had exhausted his ammunition.

The only arm in which Mexico possessed an advantage was the cavalry. From the earliest years of the colonial era, the owners of Mexico's great estates (*haciendas*) considered the ownership and mastery of horses a political and social obligation. As was the case with the southerners who formed the Confederate cavalry during the U.S. Civil War, they and their mounted employees spent many of their waking hours in the saddle. In both cases, the result was a skilled and highly mobile force.

At sea, the Mexican situation proved more dire than on land. The industrial base and fiscal resources needed to construct and maintain a navy had not existed in Mexico since 1821. The fleet consisted of a few small ships incapable of confronting their foe in a major battle. By contrast, the substantial U.S. Navy could land troops and take cities along either of Mexico's coasts more or less at its discretion.

Last, instability of Mexico's federal government proved very damaging to the war effort. During the conflict, vital functions such as the collection of taxes and the provisioning of the army could not take place. With generals serving as presidents and presidents becoming generals, both the military and civilian administrations suffered as political parties maneuvered for their own advantage.

The Northern and Western Battles

On May 3, 1846, Arista led some 4,000 troops across the Rio Grande. Five days later at Palo Alto, he encountered a U.S. force, half the size of his troops, marching to reinforce the garrison at Port Isabel. The ensuing battle was a contest of artillery. Here, the U.S. force, led by Taylor, possessed distinct advantages.

While Mexican shot often did not reach U.S. lines due to the poor quality of the gunpowder and the shorter range of their pieces, U.S. cannon struck their opponent's ranks with deadly effect. Also, the greater mobility afforded to the American commanders by the 1842 family of artillery pieces allowed rapid movement of cannon to threatened sectors. Known as Flying Artillery, these weapons proved decisive.

On the following day at Resaca de la Palma, the two armies clashed again. Unlike the previous day's battle, this contest primarily was an affair of infantry and cavalry. Bold attacks by the outnumbered American shattered Arista's army. Mexican

casualties for the two battles totaled some 350 dead and 600 wounded with U.S. losses being 44 killed and 137 wounded.

Arista retreated and the Americans occupied Matamoros on May 17, 1846. From there, Taylor struck southward, taking Camargo on July 14 and then moving westward to his main objective: the city of Monterrey. The assault on the city proved to be a costly affair, with 120 Americans killed in action and 411 wounded. Given these casualties and the prospect of more costly urban fighting if the battle continued, Taylor accepted the offer of an armistice. Signed on September 25, 1846, that agreement allowed the Mexican infantry and cavalry to withdraw. Taylor's army then occupied the city. However, two problems soon emerged.

First, General Jose Urrea, a Mexican commander associated with the Goliad massacre during the Texas War of Independence, led a partisan movement consisting of Mexican cavalry and mounted ranchers. They emerged as a major threat to U.S. supply lines. However, Taylor's most severe challenge came as a result not of actions by Urrea, but because of a decision made in Washington.

On January 3, 1847, Taylor, as per orders from Secretary of War William Learned Marcy, began transferring troops to the army being assembled by Scott for the invasion of central Mexico. On learning of this depletion of Taylor's strength, Santa Anna began preparing an attack on Monterrey.

Taylor realized the futility of barricading himself in the city and enduring a siege in the middle of hostile country. So he moved south with a force of barely 5,000 men to confront Santa Anna at Buena Vista on February 22, 1847. The size of the Mexican force has been estimated at 20,000 to 25,000 men. During both the first and second days of the battle, Mexican forces attacked *en serie* rather than en masse. That enabled the rapidly moving U.S. artillery to shift from one threatened sector to another. The destructive firepower of the American cannon proved decisive and on the night of February 23, 1847, Santa Anna ordered a retreat. At the battle's end, 40% of his army was killed, wounded, or missing in action. In contrast, Taylor lost some 15% of his army. The Battle of Buena Vista concluded major hostilities in the northeast.

In the west, American forces achieved their initial objectives set by Polk: to take the Mexican provinces of New Mexico and California. This campaign

began on June 30, 1846, as Colonel Stephen Watts Kearny led a force of 500 regulars and 1,100 volunteers from Fort Leavenworth, Kansas. They reached the New Mexican capital of Santa Fe on August 18, 1846, having met no significant opposition. Although Governor Manuel Armijo tried to raise a militia force from some 57,000 Mexicans living in that province, he failed to do so.

Kearny entered Alta California in December 1846. His forces proved vital in crushing the Mexican resistance that had remained after both the earlier U.S. naval landing at Monterey on July 7, 1846, and the capture of Los Angeles by a naval expedition on August 12, 1846. Polk believed that once he seized these two Mexican provinces and secured the Rio Grande frontier, the Mexicans would accept a *fait accompli* and negotiate a peace. They did not.

The Battles in Central Mexico

Although the Mexican territories so far occupied by the United States amounted to hundreds of thousands of square miles, they contained only 7% of Mexico's population. That demographic reality left the Mexican government with considerable resources for further resistance. Any Mexican government surrendering half of the national territory before the possibilities of such resistance had been exhausted would have faced charges of (and probably criminal trials for) treason. So there would be no Mexican request for peace. Consequently, the United States proceeded with the invasion of Central Mexico.

On March 9, 1847, the Americans landed at Collado Beach, several miles south of the port of Veracruz. They chose this site to avoid the very modern and potent French cannon in the harbor fortress of San Juan de Ulúa. Marching north, they besieged the city for 15 days and forced its surrender. Since every drop of water needed to sustain the 5,000 Mexican in the harbor fort came from Veracruz, San Juan de Ulúa soon surrendered.

Scott then decided to move his forces off the coastal plains before the yellow fever struck. Before doing so, he promulgated a strict policy regarding the treatment of civilians that would prove of great benefit to his army. Scott ordered his men to pay for every item taken from Mexicans, to commit no offenses against them, and to show public respect to

religious and civil authorities. He understood that unless Mexicans along the route sold food to his forces, he could not advance. Also, Scott thought that such civility would lessen the willingness of the more than 2 million Mexicans living athwart his line of march to participate in a mass uprising.

On April 8, he headed toward Mexico City. Santa Anna and a Mexican force of between 11,000 and 12,000 men awaited him at Cerro Gordo, the mountain pass leading from the coastal plain to the highlands. Rather than focusing on frontal attacks against well-fortified positions, Scott exploited a gap in the Mexican defenses located by engineers led by Captain Robert E. Lee. Following initial clashes on April 17, 1847, the Americans successfully attacked this weak point at Atalaya, stormed the El Telégrafo position in close quarters fighting, and then struck Santa Anna's main camp at Cerro Gordo. The Mexican position collapsed in barely 3 hours.

At this point, the Mexican president Pedro Maria Anaya decided to begin guerrilla warfare in central Mexico. In an April 28, 1847, proclamation, he called for volunteers to command a new force, the Light Corps (*Cuerpo Ligero*). The terms of appointment required that each commander have sufficient private resources to support his force and that he operate in an assigned geographic area.

By June 1847, these guerrillas became so formidable that Scott informed Marcy that a force of 1,200 to 1,500 men would be needed to escort a single U.S. general from the forward American positions back to Veracruz. During July to August 1847, every American supply convoy leaving Veracruz departed with an escort of at least 1,000 soldiers. Meanwhile, Scott marched toward the climactic battles that awaited him before Mexico City.

There, Santa Anna awaited him with a force of some 20,000 men. Many of these men joined the army under duress and did not receive adequate weaponry or training. Also, the officers Mexico fielded for this battle reflected long-standing weaknesses in the national army. Between 1821 and 1847, generals participated in many of the 29 (often violent) changes of government that took place during those years. In an environment in which advancement rested in large part on political factors, a first-rate officer corps did not develop.

On entering the Valley of Mexico, Scott confronted a formidable set of geographic barriers. To the south and east, Lakes Chalco, Texcoco, and

Xochimilco limited an invader's movements as did nearby marshes and swamps. Consequently, Santa Anna assumed that Scott would approach from the northwest and constructed a very strong defensive position at El Peñon.

Scott then took the same course he had taken at Veracruz and at Cerro Gordo: He found an alternate avenue of approach. That route consisted of a ravine passing through the Pedregal, an area of volcanic stone lying in the southern sector of the defenses. At dawn on August 20, 1847, U.S. soldiers under General Persifor Frazer Smith surprised and routed General Gabriel Valencia's Army of the North at Contreras.

Santa Anna responded by trying to close this gap in his defenses by ordering several commands to regroup at Churubusco. In turn, Scott promptly attacked this point from both the front and rear. On August 20, 1847, U.S. forces turned the flank of the Churubusco position, forcing a second Mexican retreat. Although American losses had been severe (163 dead and 865 wounded), Mexican losses amount to some 10,000 men killed, wounded, and (mostly) missing.

The truce then requested by Santa Anna lasted until early September, when Scott, angered by the Mexican's efforts to rebuild its army, informed the foe that military operations would resume on September 6, 1847. On September 8, 1847, Scott's forces attacked at Molina del Rey and Casa Mata. Inexplicably, the American commanders did not give their artillery time to do its deadly work and the Mexican defenders repelled multiple attacks at great cost to the Americans. Only after employing the artillery to full effect did the Americans take these points. During these attacks, the U.S. Army lost more men in less time than at any other confrontation of the war. American casualties totaled 787, of whom 116 were killed. This amounted to almost a quarter of the forces engaged. Mexican losses stood at 2,000.

The final battle for the capital took place on September 13, 1847. In this confrontation, Scott attacked Chapultepec Castle. Having learned the lessons of the previous day, he ordered that an intense and prolonged artillery bombardment precede the infantry assault. The fortress fell that day. Rather than witness an American triumph, one young cadet defending the castle jumped from the parapet to the ground wrapped in his nation's flag.

On the following day, Scott entered Mexico City. A group of civilians greeted him with sniper fire and a barrage of rocks. He responded by cannonading part of the city and threatening to allow his troops to begin looting if fire did not cease. The hostile Mexicans complied. U.S. casualties in the battles for Mexico City numbered some 3,000, with Mexican casualties being at least five times that figure.

In Mexico City, Scott maintained his conciliatory policies toward civilians. He allowed the municipal government to retain its powers and gave it revenues belonging to the national government. Soon thereafter, he turned his attention to guerrillas by dispatching 5,000 men to man garrisons at five points along the supply route. However, supply convoys continued to require escort exceeding 1,000 men until the March 1848 truce took effect.

The Negotiations

On the day before Scott's forces entered Mexico City, the Mexican government left the capital for Queretaro, some 125 miles to the north. In spite of their circumstances, the nation's legislators and president were not ready to surrender. Some of them believed that by waging a guerrilla war, Mexico could deny the Americans a clear victory and ultimately force them to withdraw. Also, many politicians still feared the accusation of treason that might result from the surrender of much of the nation's territory. Last, Mexicans of all political persuasions took hope from a report of rising antiwar sentiment within the United States.

There, the unexpectedly high human and financial costs of the war strengthened the Whigs, who always had opposed Polk's expansionist goals. Also, powerful forces within his own Democratic party grew increasingly worried about the possibility that the addition of so much new territory would disrupt the balance of legislative power between the two main regions of the United States. Northerners feared that the new territories would become states open to slavery with a consequent increase in southern power in both the federal House of Representatives and the Senate. Conversely, many Southerners thought that the new territories would be filled with immigrants and free-state advocates who would proceed to reduce the South to a politically marginal force in both legislative bodies.

In April 1847, a State Department clerk, Nicholas P. Trist, joined Scott's army to negotiate a final peace treaty with Mexico. Tensions arose between Polk, Scott, and Trist over the terms for ending the war. The president stood willing to occupy Mexico until the Mexican government agreed to his terms. In contrast, Scott remained convinced that if the American occupiers remained indefinitely, Mexico would collapse into anarchy and that there would be no government with which to sign a treaty. Trist, although publicly loyal to Polk, privately considered the war an unjust one and sought a treaty that would take as little from Mexico as possible while minimally pleasing the president. Polk eventually resolved these conflicts by cashiering Scott and recalling Trist. The diplomat, however, refused to accept his recall order and proceeded to negotiate the Treaty of Guadalupe Hidalgo signed on February 2, 1848.

The consideration that finally brought the Mexican government to the peace table was the revolts occurring within Mexico. With most of the Mexican army having been defeated by the Americans, no adequate force remained to secure Mexico's social order. That polarized structure included a majority composed of largely impoverished Indians and mestizos (persons of mixed ancestry), who had little role in the nation's political or economic life, and a ruling minority of more lightly pigmented Mexicans, who feared them.

By late 1847, revolts had spread from southern Mexico to the center of the country, and senior officials of the government feared the prospect of a nationwide war along lines of ethnicity. The eruption of that sort of conflict at the start of Mexico's 1810 War of Independence had cost the nation 1/10 of its population and decades of lost growth. The Mexican government now sought aid from the invader.

In the Truce Agreement of March 6, 1848, the U.S. Army agreed to disperse any group of armed men their forces encountered other than those of the Mexican army. Since the Americans held Mexico City, Puebla, Monterrey, Veracruz, Tampico, Acapulco, and Perote, the U.S. Army now protected major cities and strategic points from rebel attack. Additionally, substantial quantities of infantry weapons and ammunition were sold to the Mexican government at below market prices. U.S. forces completed their withdrawal from Mexican territory during August 1848. By 1849, some 20,000 Mexican troops were fighting various rebel groups.

That truce agreement proved as critical to ending the conflict as did the Treaty of Guadalupe Hidalgo. Although Trist's treaty gave the United States the Rio Grande boundary sought by the Texans, he abandoned Polk's objective of obtaining Baja California. Also, the two nations pledged to respect the rights of Mexicans in newly conquered U.S. territories who elected to become American citizens and to cooperate on subduing hostile indigenous border tribes. Although very much angered by Trist's concession, Polk nonetheless decided that a better document could not be negotiated in the rapidly changing political climate.

Lessons Learned

First, the conflict demonstrated the critical military importance of maintaining good relations with the civilian population of an occupied nation. Had Mexicans along Scott's line of march either withheld food or participated in a general uprising, the U.S. forces, which totaled barely more than a single modern division, well might not have reached Mexico City. But his insistence that his troops respect the religion, private property, and autonomy of the Mexican communities through which they passed converted potential opponents into assets. Mexicans sold food to his army, thereby relieving Scott of a critical supply concern. Also, allowing local officials to continue exercising authority in managing day-to-day affairs meant that the American general in chief would not have to constantly weaken his forces by assigning small and easily isolated garrisons to each town.

Furthermore, the conflict demonstrated the importance of excellent leadership. Scott proved himself a bold, thoughtful, and sagacious commander. Those qualities marked the distinction between victory and defeat. For example, if he had allowed his troops to commit the offenses to Mexican civilians and sensibilities that characterized Taylor's campaign in the north of the country, the resulting civilian hostility well might have cost him the final victory and perhaps even his life. But he learned from Taylor's errors and consequently promulgated rules of conduct that he then strictly enforced. Similarly, he swiftly recognized the menace posed to his infantry by mounted guerrillas and modified his army's procedures to minimize casualties resulting from guerrillas picking off stragglers.

In contrast, Santa Anna's failure to act at a critical point cost his nation dearly at Buena Vista. Had he ordered his army to attack *en masse* rather than *en serie*, the American's flying artillery would not have been able to direct the same massed fire against an entire army that it could when facing piecemeal attacks. Here, the victory might have been Mexico's had he seen the opportunity. Similarly, his failure to adequately fortify his rear at Cerro Gordo cost his nation an entire army and opened the country's heartland to attack. Last, his lack of imagination and consequent failure to order adequate reconnaissance before the opening battle for Mexico City blinded him to the fact that the Pedregal indeed could be crossed by the foe. Santa Anna's mediocrity proved most damaging to Mexico's cause.

Scott's campaign also demonstrated the value of a lean force structure. His decision to divide his force into four autonomous all-arms units increased the flexibility with which they could respond to various contingencies. Unencumbered by the necessity of waiting for a steady flow of supply trains bringing food to his army, he could move rapidly.

Last, the campaign demonstrated the critical importance of good civil-military relations and provided examples of the difficulties that can be expected to occur as a matter of course. The greatest of these was the matter of perception. From Washington, Polk and his fellow expansionists perceived the struggle as a primarily political one and insisted on an indefinite occupation. In contrast, Scott's perspective was that of a general deep into enemy territory. To him, indefinite occupation was not a tactic but a menace. While these differences might have been resolved had the president and the general in chief trusted each other, they did not. The president saw Scott as a potential political rival. This poisoned their working relationship.

Historical Interpretations

Throughout the remainder of the 19th century and the first third of the 20th century, U.S. historians wrote of the conflict in a triumphant tone. Horatio Ladd's *History of the War With Mexico* (1883) and George Lockhart Rives's *The United States and Mexico* (1913) both portray the outcome of the conflict in very positive terms. This school of thought reached an apogee with the 1919 publication of Justin H. Smith's *The War With Mexico*. In

this two-volume work, he deemed the U.S. seizure of half of Mexico's territory to be just compensation for various acts of Mexican misconduct.

This flow of U.S. historical interpretation began to turn with the 1935 publication of Albert K. Weinberg's *Manifest Destiny: A Study of Nationalist Expansionism in American History*. Therein, the author attributed the cause of the conflict to catalysts both ignoble as well as honorable.

In the following decades, historians approached the conflict from multiple perspectives. Works emphasizing motivations, such as racial prejudice and greed, included Reginald Horsman's *Race and Manifest Destiny* (1981), Thomas R. Hietala's *Manifest Destiny: Anxious Aggrandizement in Late Jacksonian America* (1995), and Richard Griswold del Castillo's *The Treaty of Guadalupe Hidalgo: A Legacy of Conflict* (1991). Concurrently, other authors sought to exhaustively chronicle the conflict without taking a triumphal or condemnatory perspective. Most prominent among these books are K. Jack Bauer's *The Mexican War 1846–1848* (1974) and the work jointly authored by Seymour Condor and Odie B. Faulk in *North America Divided: The Mexican-American War 1846–1848* (1971).

In Mexico, the books published in the aftermath of the conflict utilized a primarily narrative perspective rather than the combined narrative and thematic perspectives seen in the work of Lockhart, Rives, and Smith. Works of excellent quality making extensive use of primary sources include Ramon Alcaraz's edited volume *Apuntes par la historia de la guerra entre Mexico y los Estados Unidos* (1848), Carlos Maria de Bustamante's *El Nuevo Bernal Diaz del Castillo, o sea, la historia de la invasion de los angloamericanos en Mexico* (1847), and Jose Maria Roa Barcena's *Recuerdos de la invasion norteamericana* (1883). Commenting on the causes of the war, Alcaraz offered the brief opinion that the conflict arose from American greed and Mexican weakness.

To the extent that he and other Mexicans delved further into the causes for Mexico's loss, they cited the disunity exemplified by the political disorders of the early national period and the alleged nature of the Indians. Many Mexicans of that era, such as Roa Barcena, unselfconsciously held the indigenous people in contempt.

The current Mexican interpretation of the causes and outcome of the conflict are best represented in Josefina Vasquez's *La intervencion norteamericana*,

1846–1848 (1997). Therein, she writes of a United States whose territorial ambitions neutralized divisive political quarrel, whose army was small but modern, and whose immigrants could be easily converted into soldiers that proved superior to a Mexico weakened by decades of revolts that could call only on a demoralized population and a politicized army.

Current Mexican scholarship examines war in a regional or local context. Typical of these works are Maria Gayon Cordova's *La ocupacion yanqui de la ciudad de Mexico* (1997) and the anthology edited by Laura Herrera Serna, *Mexico en guerra* (1997). Similarly, recently published U.S. works focus on particular aspects of the conflict. Some recent examples include books such as Paul Foos's *A Short, Offhand, Killing Affair: Soldiers and Social Conflict During the Mexican War* (2003) and Manley Witten's *War With Mexico: America's Reporters Cover the Battlefield* (2010).

MEXICO

Consisting of 31 states and a federal district, the United Mexican States (Estados Unidos Mexicanos) is a republic of 761,601 square miles with an estimated 2009 population of 111,200,289. The nation is bounded on the north by the United States of America and on the south by Guatemala and Belize. Additional territories include a small number of offshore islands. The political, economic, financial, and intellectual capital of the nation is Mexico City, which has an estimated metropolitan population of 22 million.

Mexico's government consists of executive, legislative, and judicial branches. The president is elected for a term of 6 years and may not run for reelection. The legislative branch has two houses, the Senate and the Chamber of Deputies. Each state and the federal district elect two senators, who serve a term of 6 years. In contrast, deputies serve for only 3 years. Also, the size of each state's representation in this chamber is based on its population. Both senators and deputies are barred from seeking two consecutive terms. The judicial branch is led by the Supreme Court, which consist of 21 judges who may preside as a full court or in sections. Candidates for the court are nominated by the president and subject to Senate approval.

Mexico's economic system combines market and state components. As per the Constitution of 1917, the federal government claims ownership of all natural resources, rivers, and other inland marine waters. Also, the government retains ownership of all facilities that generate and transmit electricity and of the petroleum extraction, refining, and distribution network. However, faith in the state diminished over the past four decades, and consequently, many other government enterprises have been sold off, including the national railway system and the national telephone company.

There are three major political parties in Mexico: the Partido Accion Nacional (PAN; National Action Party), the Partido Revolucionario Institucional (PRI; Institutional Revolutionary Party), and the Partido de la Revolucion Democratica (PRD; Party of the Democratic Revolution). The PAN includes both the Mexican equivalent of European Christian Democrats as well as more conservative elements. The PRI contains two wings. The first, known as technocrats, favor a wider role for the private sector and do not embrace the traditional concept of the corporate state, which the PRI supported for many decades. Typically, their leaders come from Mexico City and possess graduate degrees. The other group, known as the dinosaurs, argues that the traditional PRI organization combining labor, business, and all other major groups in one dominant political party can best lead the development of Mexico. Typically, dinosaurs have more experience in politics than do technocrats. The PRD includes leftists, socialists, and Marxists who to varying degrees argue for an expansion of the role of government. Also, they favor a reduction of the foreign presence in Mexico. In contrast to the PAN and the PRI technocrats, the PRD supports a protectionist trade policy.

As a rule, the PAN is strongest in the north and west of Mexico while the PRD's base lies in Mexico City and the southern part of the nation. The PRI remains competitive throughout Mexico.

Topics addressed in the remainder of this entry include geography, early history (ca. 1200 BCE to 1810 CE), the national period (1810–1910), the modern era (1910–2012), the armed forces, and U.S.-Mexican relations.

Geography

Two mountain ranges, the Sierra Madre Oriental (Mother Mountain of the East) and the Sierra Madre

Occidental (Mother Mountain of the West) dominate much of the landscape. Both chains are an extension of the Rockies. They run southward in the form of a Y, with the stems joining some 70 miles south of Mexico City. From there, the mountains gradually decline in height, becoming the Chiapas highlands.

Flanking the outer edges of the two great mountain ranges are coastal plains and uplands. The coastal plains vary in depth from 150 miles to as little as a few hundred yards and have a hot and humid climate. In contrast, the uplands offer a more temperate climate and more fertile soil. Major ports on the Caribbean coast include Veracruz and Tampico, and major west coast ports are Acapulco and the recently constructed container port at Lazaro Cardenas. Another geographic factor of note is the absence of a major river system connecting parts of the nation in the manner of the Rhine or the Mississippi-Missouri.

Early History

The first Mexicans are believed to have migrated from northwestern Asia across the Bering Strait many thousands of years ago. By 900 BCE, they constructed their first urban communities at San Lorenzo in southeast Veracruz state. Other prominent civilizations later emerged in the Valley of Mexico at Teotihuacan, in the Valley of Oaxaca at Monte Alban, and at the dozens of cities built by the Maya in southeast.

Some 31 million people lived in Mexico when the Spanish invasion began on February 18, 1519. Faced with the challenge of prevailing against such numbers with his initial force of 508 soldiers and 100 sailors, the Spanish explorer and conqueror Hernan Cortes decided to divide and conquer. Fortunately for him, the Aztec Empire based in the Valley of Mexico had created many powerful enemies through brutal rule and by refusing to allow even the best and brightest of conquered subjects to rise into the imperial hierarchy. When Cortes began his final assault on the Aztec capital of Tenochtitlán (today Mexico City) in 1521, his army included some 250,000 Indian warriors and barely more than 1,000 Spaniards.

While the war of conquest resulted in heavy casualties, the diseases that the Europeans carried on their bodies (small pox, influenza, and the bubonic plague) proved far deadlier. Between the violence and the germs, an estimated 90% of the native population died. Even so, the remaining Indians outnumbered the colonists.

The Spanish recognized the necessities of coexistence imposed by their minority status and consequently gave legal title and protection to many loyal Indian villages. However, at no point did they or the criollos (a person of pure Spanish descent born in Spanish America) consider the Indians and those of mixed ancestry (mestizo) their equals. The economic and social practices of colonial Mexico reflected that sentiment and created a colony divided along lines of ethnicity as well as socioeconomic class.

Throughout this period, the Indians retained a strong sense of identity, territoriality, and resentment toward the criollos. As the colonial period drew to a close, the Spaniards constituted a mere 2% of the population and the criollos only 10%. The royal officials and the laws they administered derived their authority from the king, who ruled from Madrid. When a monarch died, another took his place. This left unresolved the question of who would exercise authority if by some unforeseen circumstance no monarchy existed. That hypothetical issue became a real one in 1808.

In that year, Napoleon Bonaparte decided to add Spain to the growing number of nations under French dominion and to which the ideas of the French Revolution would be exported. He waited until the followers of the king and crown prince began openly fighting over the issue of whether to resist or appease France and then invited the monarch and his son to a French palace for mediation. There, he arrested them and soon moved to install his own government in Madrid.

Given these circumstances, the predominantly criollo municipal council of Mexico City contended that in the absence of a king, authority should revert to the cities as per medieval Spanish custom. However, royal officials in Mexico believed that the king remained sovereign even though he was captive. As such, these Spanish administrators and officers considered themselves under no obligation to acknowledge any group of colonists as sovereign over Mexico or over the Spaniards who administered the colonial government. Instead, royal officials placed colonists who had advocated this change of authority under arrest. Also, the Spanish intensified their surveillance of literate Mexicans in an effort to find more opponents of imperial sovereignty.

The National Period (1810–1910)

Father Miguel Hidalgo was one such foe. In early September 1810, he learned that the Spanish knew

of his opposition and planned to arrest him. Facing with the choice of fleeing or fighting, he proclaimed independence on September 16, 1810, from the balcony of his church in the village of Dolores. As he marched toward Mexico City, many of the poor and the resentful and the hungry joined his ranks. He soon found himself leading a motley, armed group of some 60,000 southward. En route, many of the Indians and poorer mestizos took the opportunity to loot and burn rural estates (*haciendas* and *plantaciones*) and kill their owners. In response, the criollos and the Spanish colonists closed ranks against Hidalgo. Although his forces met defeat at the battle of Monte de Cruces and Hidalgo himself subsequently was captured and executed, the war continued for more than a decade.

By 1821, the royalists believed their victory to be imminent. The rebel forces had been reduced to two groups totaling no more than 4,000 soldiers. However, unforeseen developments in Europe once more disrupted the political and military equations. At that time, royalist commanders in Mexico learned that rebellious subjects had overthrown the restored king of Spain and that the new government intended to grant suffrage to all men except the Spanish subjects of African descent. In Mexico, the consequence of such a change would have meant a loss of criollo power to a vengeful populace. Consequently, a majority of the criollo officers in the Royal Army switched sides and joined with their former foes to proclaim an independent nation. The war ended with the criollos in control of all of Mexico's institutions.

From 1821 to 1855, the question of who would participate in the political and economic life of the nation dominated the national dialogue to the exclusion of almost all else. Divisions proved so bitter that the presidency of the nation changed hands, often violently, 47 times during those 34 years. In this type of environment, no effective government existed for very long. Activities essential for national development such as the maintenance of public order, the defense of the national territory, the construction of public works, and the collection of taxes did not take place.

To create a barrier to American migration, the Mexican government allowed immigrants to settle in Stephen F. Austin's Texas colony in the hope that they would assimilate and become loyal Mexicans. This did not occur. In 1836, the Texans responded to the imposition of a new and more restrictive Mexican

constitution by declaring their state an independent nation. In 1845, the United States admitted Texas to the union. Mexico responded by branding this decision an act of war.

In 1846, President James Knox Polk ordered U.S. troops into the disputed territory between the Nueces and Rio Grande rivers. Following a clash between soldiers of the two armies, war began. In the subsequent peace treaty, the Americans gained two provinces of Mexico (Nuevo Mexico and Alta California), the acquisition of which was deemed by Polk as the primary goal of his administration. The loss of approximately half of the national territory to the United States left Mexicans embittered. However, internal strife continued to consume their nation.

In 1855, Liberal General Juan Alvarez successfully led an army in defeating the Conservative President Antonio López de Santa Anna's forces. The victorious Liberals promptly abolished legal privileges of the Church and the army, ordered the seizure and subsequent sale of all Church property other than the churches themselves, and proclaimed universal male suffrage. In turn, this led to a second war between Liberals and Conservatives, known as the War of the Refo (1858–1861). This too ended in a Liberal victory. However, disgruntled Conservatives then allied themselves with the French, whose emperor, Napoleon III, invaded Mexico in 1862. This third war between Liberals and Conservatives ended with another Liberal victory in 1867.

At the head of the victorious Liberal coalition stood Benito Juárez, Mexico's first and only Indian president. Born into poverty in the state of Oaxaca, he overcame great odds to obtain a law degree and soon entered politics. His steadfast dedication to the rule of law, to civil liberties, and to equality assured him a major place in Mexico's history as did his critical role in placing these principles at the core of the Constitution of 1857. But his role during the French invasion ensured that he would be the most revered of Mexican presidents to this day. As the invaders and their domestic allies prepared to enter Mexico City, Juárez left the capital with little more than an escort and fled to the remote northwest city of El Paso (today Ciudad Juárez). There he remained for 5 years as resistance to the occupier slowly grew and the invaders eventually left. His persistence probably saved the national cause and ever since then, he has been a symbol of the struggle against adversity.

The order that so many sought for Mexico came with the administration of President Porfirio Díaz. He seized power in 1876 and ruled Mexico until 1910, a period known as the Porfiriato. Although production of industrial and agricultural commodities increased during these decades, Díaz's model for national development proved deficient. In essence, he focused on the gross national product while neglecting to develop the most important resource of all: the people. By 1910, so many Mexicans had lost their land through evictions designed to create vast agricultural estates that only 4% of the population owned the ground on which they lived. More than 90% of the population remained illiterate. Concurrently, Díaz's decision to repress all meaningful political opposition by lethal as well as non-violent means alienated the slowly growing middle class. Last, and in spite of Díaz's mixed ancestry, the Porfirians, like the Spanish and the criollos who led the postindependence Mexico, held the majority of the nation's population in contempt. The result was the Mexican Revolution of 1910.

The Modern Era (1910–2012)

The Mexican Revolution began with the war to overthrow Díaz (1910) and ended with the adoption of the Constitution of 1917. Three factions contended for power. The largest, led by Francisco (Pancho) Villa, sought to create a nation based socially and economically on largely self-sufficient rural communities owned and controlled by their citizens. In this scenario, the nation's cities and industries would produce primarily for a domestic market and would be subordinate to the rurally based majority of the population. His support came mainly from northern Mexico.

A second faction, led by Emiliano Zapata, sought to dissolve the plantations and haciendas by giving these lands to peasants. In this scenario, lands and natural resources would be communally owned and controlled. Zapata did not address larger issues such as the role of industry and urbanization. Although often branded a modern Marxist, he in reality was a reactionary who sought to return the Indian population to the autonomy they had enjoyed centuries before.

The victors, led by Venustiano Carranza, sought to create an industrially based urban society and stressed modernity as one of their main goals. Aided by substantial U.S. material support supplied

through the American-occupied port of Veracruz, the Carrancistas won. However, the new constitution embodied concepts advocated by the defeated as well as by the victors. For example, the new constitution declared null and void all legal proceedings by which the Porfirians had seized hundreds of millions of acres of land.

The Carrancistas hoped that all elements of Mexican society would organize and then seek representation within a single ruling party. Industrialists, owners of small businesses, labor unions, and professional organizations would join to eliminate the factionalism that had plagued Mexico since the Spanish began sorting Mexicans in castes. After changing names on several occasions during the 1920s and 1930s, the party adopted the name by which it is known today: the Partido Revolucionario Institucional, or PRI (Institutional Revolutionary Party). The PRI held power from 1917 to 2000. They accomplished this goal not only by bringing a wide range of groups into the party but also by employing a combination of bribery, exclusion, intimidation, and lethal violence to curtail opposition.

From 1920 to 1968, the party maneuvered as necessary to master the political winds of the day. During the Great Depression, the administration of President Lázaro Cárdenas turned sharply leftward, returning more than 50 million acres of land seized by the Porfirians and funneling loans to communal Indian villages. From 1940 onward, the party instead chose to emphasize industrial development and encouraged growth of the private sector with infrastructure projects and interpretations of law favorable to the business community. During the 1950s and much of the 1960s, the economy grew at an annual rate of 6%. PRIistas pointed with pride to such growth as well as to the fact that the life span of the average Mexican increased from 40 years in the early part of the century to 60 years as proof of their success.

However, by 1968, the party's unity began crumbling. The socialist and progressive wings argued that the leadership had abandoned the duty of returning lands to the poor, denied credit to farms and communes in the interest of serving industry, allowed foreigners to again dominate certain Mexican industries, fostered a polarized distribution of income reminiscent of the Porfiriato, and sought to repress opponents. The PRI's leaders argued that their accomplishments stood without parallel in

Mexican history. An additional, if often unspoken, argument was that if the repression of opponents on either side of the political spectrum was the price of such progress, that price remained well worth paying.

When several hundred leaders of the protest movement rallied at Mexico City's Tlatelolco Plaza on October 2, 1968, army helicopters and marksmen opened fire. At least 400 people perished. In the following days, more executions took place. No formal investigation of the events of that week ever took place. The PRI now split.

The leftists formed a number of successive parties, the most recent of which is the PRD. Concurrently, many of the more conservative PRIistas, disillusioned by the government's violence, joined the PAN.

Díaz's successor, Luis Echeverría Álvarez, tried in vain to restore party unity by expanding social welfare programs, by visiting communities throughout the country, and by striking a strident leftist and nationalist tone in his foreign policy. His criticism of the U.S. role in Latin America and his support of the anti-Zionism resolution at the United Nations were part of this effort. Also, he welcomed refugees, such as Isabel Allende, fleeing dictatorships in Latin America just as Lázaro Cárdenas had welcomed tens of thousands of Spaniards fleeing the victorious General Franco in 1936. But the wounds opened at Tlatelolco could not be closed.

Those events of 1968 marked the beginning of a series of crises. The first of these was an economic crisis. During his 1976–1982 presidency, José López Portillo sought to stimulate the economy by undertaking infrastructure projects using money obtained from loans based on future oil revenue. When the price of petroleum collapsed, the nation was left with massive federal debts and a weakened private sector. As bankruptcies increased, López Portillo nationalized the country's banks. This action angered the business community. Simultaneously, spiraling inflation and rising unemployment destroyed loyalty to the PRI across a wide segment of Mexican society.

From the late 1970s to the early 1990s, inflation accelerated to the point at which the number of pesos required to buy a single U.S. dollar increased from 8 to 3,300. The life savings of many Mexicans as well as innumerable businesses, both large and small, were lost.

By 1988, dissatisfaction with the PRI had become so widespread that a leftist opposition grouping of

three small parties, led by Cuauhtémoc Cárdenas, seriously challenged the PRI in the presidential elections. The victory of his opponent, Carlos Salinas de Gortari, probably rested on vote fraud. At the state and local levels, the PAN and PRD continued to win more and more elections.

Then on January 1, 1994, the largest Indian rebellion since the 1847 Caste War erupted. Led by four Maya commanders, they seized the capital of the state of Chiapas and other areas of that southern state. Three intertwined factors led to the revolt: (1) poverty, (2) corruption, and (3) official indifference. Chiapas ranked as the poorest state in Mexico, and the majority of its indigenous citizens eked out a meager living from the little land they owned. Over the preceding decades, the federal government made little effort to change this. Chiapas's remoteness from the demographic, political, and economic centers of power ensured that the state's development needs would receive a low priority. Also, the unspoken, but powerful, opinion that Indians were determined to remain poor was a factor. Last, the political syndicates that ran the state for their own benefit regularly produced large majorities for the PRI and in return did not fear interference from the federal government. Levels of corruption proved extraordinary. In one case, a town's airport was built 20 miles from the city so that construction could take place on a political boss' land.

The rebels called their army the Ejército Zapatista Liberación Nacional (National Zapatista Liberation Army). They chose as their spokesman Subcomandante Marcos, a non-Indian history professor at a suburban Mexico City campus of the National Autonomous University of Mexico. Although he spoke and wrote of concepts such as neoliberalism and imperialism, the core of this rebel movement proved to be regional and Indian. The federal government confined the rebels to a small area and subsequently diffused the situation with prolonged negotiation involving some concessions.

From 1968 onward, the violence, the inflation, the consequent loss of employment and savings, and the economy's chronic inability to generate jobs at a rate equal to the growth of the population catalyzed a massive migration of Mexicans to the United States. The most reliable estimates are that some 12 million have sought permanent or temporary employment on the north side of the Rio Grande

since the first of the economic crises began in the late 1970s. The wages sent back to Mexico by these workers now constitute Mexico's second largest source of revenue.

A far more violent migration also developed during these decades as criminal syndicates within Mexico sought to satisfy the demands of the millions of substance abusers in the United States. Cocaine, heroin, marijuana, methamphetamines, and any other illicit substance that could be sold to Americans was processed, transported, and vended by these gangs. The billions of dollars in profits financed the expansion of these syndicates into groups capable of bribing, intimidating, and/or killing police and judges who obstructed them.

So massive were the losses of wealth and confidence and public order that the PRI's defeat became inevitable. In 2000, PAN candidate Vicente Fox won the presidential election even though the PRI and PRD retained joint control of both the Senate and the Chamber of Deputies. There, they blocked Fox's major proposals. His successor, PANista Felipe Calderon, significantly increased the involvement of the armed forces in combating the drug syndicates (*narcotraficantes*). The new president believed that only the federal government possessed the power to prevent the *narcotraficantes* from emerging as a parallel government.

These efforts have not resulted in the eradication of the trafficking syndicates. Several factors account for this failure. First, the capture of syndicate leaders often results not in the disintegration of the syndicate but in the replacement of that leader. Second, the syndicates appear to be coalescing rather than fracturing. Two cartels, the Sinaloa and the Zeta, now dominate the drug trade in the majority of the nation. Third, the syndicates' tactics make the task of the armed forces more difficult. Instead of fighting stationary battles, they often target a town's police station, killing officers and then local elected officials. Although the federal government responds with troops, the *narcotraffickers* usually are gone by the time troops arrive, and the local administration and population have been taught that they can be assaulted at will. In this manner, federal authority has been destroyed in many areas of the nation, particularly in the areas bordering the United States. Last, the quality of training, equipment, and integrity of many of Mexico's police forces leaves much to be desired.

Calderon's administration failed to crush the drug syndicates just as surely as did Fox's. In the 12-year period of PAN presidencies extending from 2000 to 2012, some 60,000 Mexicans lost their lives to drug-related violence. Crimes such as kidnapping and robbery significantly increased. The PANista's failure to remedy this rising tide of violence constituted one of two factors in his party's loss of power in the 2012 presidential election. Economic problems were the other cause. Although Calderon could point to increases in the gross domestic product in excess of those in the United States, these improvements brought little change to the 40% of Mexicans living below the poverty line.

Consequently, the PRI candidate, Enrique Peña Nieto won the presidency by a wide margin in 2012. A question of major importance remains whether he indeed will bring a new, honest, and effective administration to Mexico or whether the PRIistas will fall back into their old corporatist pattern of corruption. Interestingly, the new president does not publicly identify himself as a technocrat or a dinosaur.

Armed Forces

Mexico's armed forces report to two separate cabinet-level officials. The army reports to the secretary of national defense while the navy, the naval air force, and the marines report to the maritime secretary. The Mexican Air Force is considered a branch of the army.

The armed forces budget currently totals a modest 0.05% of the gross domestic product and that level of spending is reflected in the type of equipment used. Mexico possesses no main battle tanks, no jet fighter more recent than the 10 F-5 and 2 F5-E Tigers purchased from the United States in 1982, and no air defense missiles. Similarly, the army's tactical air support consists of middle and late Cold War-era helicopters and some propeller-driven aircraft such as the Swiss-made Pilatus P-7.

The primary objective of Mexico's armed forces is the maintenance of domestic order. Given this goal, the absence of external military threats and no foreign commitments other than the occasional humanitarian mission, Mexico probably does not need Mach 2+ jets or state-of-the-art tanks. However, this does not alter the unpleasant reality that much of the counterinsurgency and counter-narcotrafficking equipment is obsolescent. For example, the Vietnam-era Bell Huey helicopters and

the more modern propeller-driven planes that can be used for strafing are quite inferior to the range of platforms now available.

Since the civil conflict between powerful narcotics syndicates and the government intensified, exact and recent figures about the size and disposition of the armed forces are not as readily available as might be wished. Based on the most recent information, the air force consists of less than 12,000 personnel, including a 1,500-man airborne brigade. The roster of combat aircraft includes 10 F-5 jets, T-33 trainer jets, 70 Pilatus P-7 aircraft, 70 attack helicopters, and a transport fleet of 35 aircraft including seven Lockheed C-130 planes.

The Mexican navy reliably is reported to number some 37,000 personnel, of whom 8,600 are marines. Although the general headquarters is in Mexico City, there are separate headquarters for the Pacific forces (Acapulco) and the Atlantic forces (Veracruz). The navy confronts the same equipment problems as does the air force—a mixture of platforms, many of which are quite old and rather obsolescent. Newer equipment includes six *Halcon* (Falcon)-class patrol boats purchased in 1983 with platforms for helicopters. The most recently available figures list the principal forces as 3 destroyers, 8 frigates, and 109 coastal combatants. In addition to traditional responsibilities, such as defense of territorial waters, the navy also is responsible for dredging the nation's port facilities and for oceanographic research.

The Mexican army includes some 192,000 active-duty personnel and reserves of 559,000. The main maneuver units consist of three corps of three brigades each based in the region of Mexico City. Also based in the capital area are elite units such as the Special Forces Brigades and the Presidential Guard. Most of the remaining troops are posted to each of the nation's 12 military regions, which in turn are divided into 45 military zones. Both independent regiments and battalions are posted to each of these zones.

The army's equipment consists of a full range of light infantry equipment such as the domestically manufactured FX-05 Xiuhcoatl battle rifle, the Heckler & Koch HK 33 assault rifle, and the Browning M2 machine gun. The artillery arm largely consists of towed weapons, including 105-millimeter howitzers and light, medium, and heavy mortars. The army's armored fighting vehicle is the French-built ERC 90F1 Lynx, which mounts a 90-millimeter cannon.

Although Mexico's constitution requires all able-bodied men to undergo military training, this universal service consists of a few perfunctory drills and a very brief time on the shooting range.

Recent U.S.-Mexican Relations

Relations between the two nations remain complex with mixed objectives and feelings on both sides of the border. The considerable differences between the economic, military, and demographic power of the two countries give rise to a natural suspicion and resentment on the part of the Mexicans. Given the U.S. conquest of half of the nation's territory during the 1846–1848 war, the subsequent American economic domination of Mexico in the late 19th and early 20th centuries, and U.S. intervention during the Mexican Revolution, these concerns are not without foundation. But conversely, Mexicans of all socioeconomic strata understand that the United States can be of use to them. The Americans provide an adjacent and affluent market for Mexican products. Imported U.S. capital and technology can be of use. Last but not least, the money sent back to Mexico by expatriates working in the United States now constitutes the nation's second largest source of foreign earnings and provides financial sustenance to millions of Mexicans. Mexico seeks a close relationship with the United States in which Mexican sovereignty remains respected. For example, the considerable American military equipment offered for antidrug efforts under the Merida Plan remains welcome, while the presence of American advisors to go with that equipment would be considered an unacceptable diminution of Mexican sovereignty.

In pursuit of traditional objectives, the United States seeks open global markets and successfully obtained such access to Mexico with the passage of the 1994 North American Free Trade Agreement. However, the United States remains concerned with the migration of so many Mexicans into the United States. While this additional labor proved welcome during periods of economic growth, the recent economic recession resulted in many Americans viewing the migrants as competitors rather than fellow workers.

Also, the flow of drugs into the United States remains an issue of great concern and ranks as perhaps the most critical unresolved issue. The Americans argue that without this flow of drugs, the United States would not have a narcotics problem.

The Mexicans argue that if Americans would stop using these substances, the problem would vanish. Ironically, as the two nations become more closely linked, some tensions seem to become more acute.

This contrasts with earlier Cold War relations. Then, both nations accepted their differences. The United States recognized that as a country that endured six invasions, Mexico placed noninterference in the affairs of other nations at the top of her list of global priorities. So while Mexico's refusal to join the North Atlantic Treaty Organization rankled some U.S. administrations, the Americans accepted the decision without retaliating. Similarly, while the Americans resented the 1938 nationalization of Mexico's petroleum, they accepted that reality and have continued to purchase Mexican oil. Indeed, from the resumption of oil imports to the United States in 1938 until the present day, Mexico never withheld a drop for political reasons.

The Future

Although the events of the past four decades give pessimists much ammunition, there also is some cause for optimism. During this same period, Mexico transformed itself from a one-party state to a multiparty democracy. The strong extended family structure that has served as the bedrock of the nation and that has survived war and famine remains largely intact. Most important, there remains a quiet and deep pride in being Mexican. To quote a very Mexican phrase, *Dios tu bendecirá* (God will bless you).

MIDDLE EAST CONFLICT

The Middle East conflict has centered on a small piece of land in the eastern Mediterranean littoral, called Palestine (*filisteen*) in Arabic and Israel (*eretz israel*) in Hebrew. For clarity, this entry will use "Palestine"—the name British authorities used until 1948—to refer to the land itself and "Israel" to refer to the State of Israel.

International, regional, and local forces have shaped the Middle East conflict since World War I. Since then, local dynamics have played an increasingly important role, despite the efforts of international actors such as the United States to mediate a peaceful resolution, an evolution that is evident in five phases: the founding of the modern Middle East (World War I to 1947), the Arab-Israeli Wars (1948–1973), occupation, resistance, and the land-for-peace framework (1973–1987), the first *intifada* and the Oslo peace process (1987–2000), and the second *intifada*, the Quartet, and Iran (2000 to the present). This entry discusses these five phases of the Middle East conflict.

Founding of the Modern Middle East (World War I to 1947)

The modern Middle East grew out of World War I. In an effort to open a new front against the Central Powers, the British High Commissioner in Egypt, Sir

Henry McMahon, exchanged a series of letters with Sherif Hussein of Mecca in 1915 and 1916. Hussein agreed to rise up against Ottoman control in return for British money and military support and Arab independence after the war. Also in 1916, Britain and France negotiated the Sykes-Picot Agreement to divide the post-Ottoman Middle East into British and French zones of influence and control. In 1917, as the joint British-Arab military campaign conquered the Levant, the British foreign secretary Arthur James Balfour issued a declaration stating, in part, that "His Majesty's Government view with favour the establishment in Palestine of a national home for the Jewish people."

Many in the region saw these events as contradictory. A mandate system set up by the League of Nations led to Arab independence in some areas, but in Palestine, Arabs, Zionist Jews, and the British clashed over Jewish immigration and control of Palestine. Zionist Jews were intent on establishing a Jewish state in Palestine, while Arabs viewed the Zionists as interlopers without a legitimate claim. Arab riots in 1921 and 1929 and an armed revolt in 1936–1939 led British authorities to limit Jewish immigration and clamp down on Arab armed activity, angering Jews and Arabs alike.

Intercommunal violence in Palestine escalated after World War II. By 1947, British authorities determined that they could not feasibly prepare Palestine for independence, so they turned the Palestine question over to the newly formed United Nations, declaring that British forces would withdraw from Palestine in 1948. In November 1947, the UN General Assembly voted to create two states, one for Arabs and one for Jews. Violence in Palestine flared soon after, with Jewish militia in Palestine battling against local Arab armed groups. On May 14, 1948, Zionist leaders declared the establishment of the State of Israel, after which Egypt, Iraq, Jordan, Lebanon, and Syria attacked.

The Arab-Israeli Wars (1948–1973)

The 1948 War, also called the Israeli War of Independence, saw the Middle East conflict take on a more regional character. The question of how to confront the Jewish presence in Palestine had become the preeminent concern of Arab politics, and for Arab leaders not to have attacked Israel in 1948 would have branded them as cowards. Still, there was little operational coordination among the Arab armies, which contributed to Israel's victory in

1949, as did the better leadership and motivation of the poorly equipped Israeli forces.

The 1956 War, also called the Suez Crisis, resulted from the Egyptian President Gamal Abdel Nasser's decision to nationalize the Suez Canal. The British and French governments convinced Israel to attack Egypt, giving them a pretext to secure the canal themselves. As the three forces carried out this plan, an irate President Dwight D. Eisenhower pressured all three to withdraw, resulting in significantly diminished British and French influence in the region.

Israel's stunning victory in the 1967 War, also called the Six Day War, reshaped the Middle East. After Nasser remilitarized the Sinai and closed the Straits of Tiran, vital to Israeli shipping, Israel launched a daring air raid on Egypt, destroying the Egyptian air force on the ground and winning Israel the air superiority it needed to defeat Arab ground forces. Despite disadvantages in manpower and technology, Israel more than doubled the area under its control. In the

years after the war, the United States began a pattern of staunch diplomatic and material support, using its influence to deflect international condemnation of Israeli actions and extending unprecedented levels of humanitarian and military aid to Israel.

The 1973 War, also called the Yom Kippur or October War, took Israel by surprise. After the cross-canal raids, artillery duels, and air battles of the 1969–1970 War of Attrition, Egypt began intensive preparations to take back the Sinai, conscripting soldiers for indefinite terms and secretly practicing the canal crossing. On Yom Kippur in October 1973, Egyptian forces crossed the canal and used surface-to-air and antitank missiles synchronized with infantry and armor to drive a salient into Israeli-held territory. The Israelis eventually regrouped and achieved military victory, due in part to American materiel support. Despite this, it was an important political victory for Egypt, one that gave Anwar al-Sadat, Nasser's successor, the political capital necessary to negotiate with Israel.

Occupation, Resistance, and the Land-for-Peace Framework (1973–1987)

With the end of the 1973 War, the Middle East conflict passed from an era of regional war to one of localized conflict involving Palestinian insurgents and peace negotiations. The Arab League (also called the League of Arab States) had founded the Palestine Liberation Organization (PLO) in 1964 to organize Palestinian guerrilla activities against Israel. Yassir Arafat, who had founded the Fatah guerrilla movement, became PLO chairman in 1969, reducing the level of Arab League control over the PLO and increasing the number of cross-border attacks on Israel. After Israel's occupation of the Palestinian territories in the 1967 War, a homegrown Palestinian insurgency ensued. In 1970, Jordan forced the PLO out of its territory, and by 1972, Israel had largely contained the insurgency in the territories. In 1978 and 1982, Israel invaded Lebanon, the PLO's largest base after its expulsion from Jordan. PLO guerrillas then left Lebanon and began to focus on terrorism outside Israel.

American efforts to mediate an end to the Middle East conflict began in earnest after the 1973 War. Secretary of State Henry Kissinger helped negotiate a cease-fire, and after Sadat's 1977 speech to the Israeli Knesset, President Jimmy Carter brokered the 1978 Camp David Accords. The Arab League expelled Egypt for concluding a separate peace with Israel, and Islamists assassinated Sadat in 1981, but Camp David had established the land-for-peace framework for Arab-Israeli negotiations: Israeli-controlled land in return for Arab peace.

The 1980s saw the continuation of American mediation, this time in an effort to resolve the conflict over the Palestinian territories—the West Bank and the Gaza Strip. These efforts were based on Jordanian stewardship over the territories rather than Palestinian statehood and were received coolly. Furthermore, the PLO was considered the “sole legitimate representative of the Palestinian people” (League of Arab States, 1974), but neither the United States nor Israel would negotiate with the PLO due to its terrorist activities.

The First *Intifada* and the Oslo Process (1987–2000)

The situation changed dramatically in late 1987. On December 8, a traffic accident involving an Israeli truck driver killed four Palestinians in the Gaza Strip.

The next day, demonstrations broke out against the Israeli occupation. Eventually, these demonstrations spread to cities and towns across the West Bank and the Gaza Strip, and included tire burning and stone throwing. The Israeli response, condemned by many in the international community, involved deporting leaders and breaking the bones of demonstrators, which contributed to the spread of what became known as the *intifada*, Arabic for “shaking off.”

The *intifada* asserted the influence of Palestinian leaders who, unlike Arafat and much of the PLO leadership, lived in the territories and were more open to a negotiated settlement. When Arafat and the PLO returned to the territories in 1994, Palestinians made a distinction between those who had assumed power from abroad and those who had demonstrated against Israel during the *intifada*.

Despite this resurgence of local Palestinian influence, international actors continued to affect the Middle East conflict. Although the PLO was not directly implicated, the bombing of Pan Am flight 103 over Lockerbie, Scotland, in December 1988, precipitated an international backlash against transnational terrorism, which in turn pressured the PLO to change its ways. Arafat renounced terrorism and recognized Israel, meeting the two American preconditions for negotiating with the PLO.

The 1991 Madrid Conference, during which Israeli and Palestinian negotiators met face to face for the first time, was an important step forward. In 1994, Jordan and Israel signed a bilateral peace treaty. In the early 1990s, there were also secret, if unsuccessful, negotiations between Israel and Syria. Perhaps most important, the Madrid Conference began the Israeli-Palestinian dialogue that resulted in the Oslo peace process, a series of agreements between Israel and the PLO aimed at establishing an independent Palestinian state in return for an end to the Israeli occupation of the Palestinian territories.

The first agreement in the Oslo process, the September 1993 Declaration of Principles on Interim Self-Government Arrangements, usually referred to as Oslo I, was negotiated with Norwegian mediation. Based on the land-for-peace framework, it provided for Israeli withdrawal from most of the Gaza Strip and Jericho; the establishment of a Palestinian National Authority—also called the Palestinian Authority (PA)—to administer these areas; and a 5-year interim period during which the two sides would negotiate a final peace agreement.

By the signing of Oslo I, the *intifada* had lost momentum. Israeli occupation policies, including control over Palestinian movement, deportations, and an extensive intelligence network, contributed to the pacification of the territories, as did the decentralized nature of the *intifada* and the signing of Oslo I. However, Hamas, an Islamic social services organization founded in the 1970s, rejected negotiations with Israel in favor of violent resistance. From 1993 on, suicide attacks were the centerpiece of this resistance. This terrorist tactic, and the Israeli responses it engendered, played no small part in building Hamas's popular appeal.

The United States mediated agreements after Oslo I, but no final peace resulted. The Oslo process faced a challenging mix of growing support for Hamas, increasing PA ties to terrorist organizations in an effort to blunt Hamas's popular appeal, Israeli unwillingness to curb settlement growth, and growing Israeli and Palestinian disillusionment due to the lack of progress. The agreements signed in the 1990s, such as Oslo II in September 1995, expanded the area under PA administration while implementing measures to preserve Israeli security. However, the 5-year time period established in Oslo I expired, and in late 1999, both sides agreed to a September 2000 deadline for concluding final status negotiations.

In the summer of 2000, the Clinton administration made a dramatic push to conclude a final status agreement between the Palestinians and Israelis at Camp David, but this too failed. The Clinton administration and the Israeli government both criticized Arafat for rejecting the best offer that had been on the table to that point, while Arafat returned home a hero for not capitulating to Israel and the United States.

The Second *Intifada*, the Quartet, and Iran (2000 to the Present)

The actions of both Israelis and Palestinians contributed to the outbreak of the second *intifada*. On September 28, 2000, amid concerns that Israel might cede control over the Temple Mount to a future Palestinian state, the Israeli government allowed the opposition leader Ariel Sharon to visit the site, a location that holds special religious significance for Jews and Muslims alike. Many Palestinians viewed Sharon's visit as a provocation, and after Friday prayers the following day, rioting ensued throughout

the Old City of Jerusalem. When Israeli security forces used both live ammunition and rubber-coated steel bullets to quell the rioting, several Palestinians were killed, and rioting and demonstrations quickly spread to other parts of the territories.

The speed and coherence with which Palestinian violence escalated during the second *intifada* suggests a greater level of organization than there was during the first. Shooting attacks spread rapidly. Most of these attacks went without a claim of responsibility, but it is likely that PA security forces were involved, in particular those affiliated with Arafat's Fatah movement. In November 2000, Hamas started firing mortar shells at Israeli settlements in and around the Gaza Strip, and in May 2001, Hamas launched a series of suicide bombing attacks, a tactic that no Palestinian group had used in more than 3 years. Palestinian Islamic Jihad began using suicide bombers in July 2001, and the following November, Hamas began firing its Qassam rockets at Israeli population centers. In January 2002, the Fatah-affiliated al-Aqsa Martyrs' Brigades also began using suicide bombers. Intergroup competition for popular support led to suicide bombing campaigns that were much more intense than they had been in the 1990s.

Intifada violence reached a peak in 2002. Israeli tactics in the Palestinian territories—some of which members of the international community condemned—contributed to the dissipation of violence. Shortly after the outbreak of the *intifada*, Israeli security forces imposed strict restrictions on the movement of Palestinians. Later in 2001, they began demolishing the homes of suicide bombers' families, and in 2002, Israel began construction of a series of concrete walls, observation towers, electrified fences, razor wire, and trenches to separate areas inhabited by Israelis from those inhabited by Palestinians. In 2004, Israel began using air strikes to kill leaders of Palestinian groups, a tactic that resulted in significant casualties among bystanders. In 2005, the Israeli prime minister Ariel Sharon withdrew Israel's permanent presence from the Gaza Strip, which drew criticism from Israel's settler movement and which Hamas used to validate its policy of violent resistance.

By early 2006, the barrier had allowed Israeli security forces to conduct more thorough operations in the West Bank, and targeted killings had significantly diminished Palestinian groups' ability

to control their operations. Hamas essentially gave up on suicide bombings in 2006 to focus on launching rockets from the Gaza Strip. Palestinian Islamic Jihad continued using suicide bombers for another year and then made the transition to rockets as well. Rocket attacks did not elicit the immediate response from Israel that suicide bombings had until Israel's large-scale incursion into the Gaza Strip in Operation Cast Lead (December 2008 to January 2009), after which rocket attacks also dropped off considerably.

Internal Palestinian strife surged with the diminution of the second *intifada*. During 2006, Fatah did poorly relative to Hamas in municipal elections, and in January 2007 national elections, Hamas gained control of the Palestinian legislature. A political deadlock ensued, with the international community refusing to deal with a Hamas-led government and Fatah reluctant to relinquish its hold on power. Six months later, a Hamas takeover of the Gaza Strip resulted in Hamas control in the Gaza Strip and Fatah control in the West Bank.

Throughout the early 2000s, international efforts to mediate an end to the Middle East conflict continued, with as little success as before. In 2002, the Quartet of the United Nations, United States, European Union, and Russia proposed a road map that specified steps that Palestinians and Israelis could take to arrive at a final peace. More recently, the Arab League has proposed normalizing relations with Israel in exchange for withdrawal to the 1967 borders, and Turkey has sought to mediate between Israel and Syria. To date, these efforts have not borne fruit, although in August 2010, the U.S. secretary of state Hillary Clinton announced the resumption of direct peace talks between Israel and the Palestine. Still, the pivotal variables in these talks remain Palestinian and Israeli actions, not the actions of international actors.

There is one set of international actors, however, that could complicate a future Middle East peace: the Iran-Syria-Hizbullah-Hamas nexus. In particular, Iran provides funding, training, and materiel to both Hamas and the Lebanese group Hizbullah. Israel's 2006 war against Lebanon was mainly confined to fighting between Israel and Hizbullah, but any future war involving Israel and a member of the nexus runs the risk of involving all of them. Recent Egyptian efforts to control the border with the Gaza Strip have reduced but not cut off Iran's support stream to Hamas. A conflict that was

internationalized with World War I and had become localized by the end of the 20th century may very well become internationalized once again, but in a potentially more dangerous way.

MILITARY ADVISORS, U.S.

Throughout the 20th century, American military advisors, military personnel sent to a foreign country to advise and aid the local military forces, have followed the flag as the United States expanded both its territory and its influence well beyond American shores. At times, these forces were tasked with training indigenous forces to combat domestic insurgencies, while at other times, Washington dispatched advisors in order to strengthen relations and foster military cooperation. Although often successful in these roles, advisors have, more often than not, been unable to transplant core American military values in the ranks of their advisees. Nor have they generally succeeded in prompting their hosts to adopt the long-standing American “performance-based selection, training and promotion system.” This entry discusses the history and the role of U.S. military advisors.

The Philippines and Latin America, 1898–1930s

America’s first major experiment in foreign military advising came in the aftermath of the Spanish-American War, as the United States supplanted Spain and expanded deep into the Pacific and the Caribbean. After the Spanish-American War, a war fought in part to liberate colonial Cuba from Spanish rule, Spain ceded control of the Philippines to the United States. Faced with a growing rebellion in the Philippines, American forces created the Philippine Constabulary to combat a native insurgency led by Emilio Aguinaldo. Created in 1901, and composed of bilingual (Spanish and Tagalog) 18- to 25-year-olds trained and led by some 70 American volunteers, the constabulary grew to some 5,000 within 5 years. While a formidable fighting force, the constabulary also had a reputation for brutality that it shed only with further American training and guidance.

The U.S. Army also simultaneously created a second military force in the islands, the Philippine Scouts. The forerunner of the scouts, members of the Macabebe minority on the island of Luzon,

assisted the U.S. Army beginning in 1899, and within 2 years, they numbered some 1,400 troops. The scouts’ success, along with pressing manpower needs, led Congress to authorize the creation of a 5,000-man Philippine Scout force, which served with U.S. military units throughout the period of U.S. colonial rule and distinguished themselves during the Second World War.

While the army took the lead in the distant Philippines, closer to home on the island of Hispaniola, the U.S. Marines created both the Haitian Gendarme and the Dominican Republic’s Constabulary. (Hispaniola is divided politically into two countries, the Republic of Haiti and the Dominican Republic. To protect U.S. interests, the marines were sent to Haiti in 1915 and to the Dominican Republic in 1916.) The marines built forces to restore order and to fight growing guerrilla insurgencies, and in the Dominican Republic, the new U.S.-led force proved especially successful. The Dominican Constabulary and the U.S. forces battled a stubborn rural insurgency that crumbled in 1921, allowing U.S. forces to leave the country 3 years later. While U.S. advisors created a capable fighting force, they could not inculcate in either of the new armed forces the traditional American respect for civilian authority. This was particularly true in the Dominican Republic where Rafael Trujillo, leader of the constabulary, seized control of the country and ruled for more than 30 years until his assassination in 1961.

During the 1920s, U.S. advisors faced similar obstacles and achieved similar success in nearby Nicaragua, where U.S. Marines built a new national army to beat back a sustained insurgency directed against the U.S.-backed government. While the newly created Nicaraguan National Guard (Guardia Nacional) and the U.S. Marines fought the rebels to a draw, which persuaded their leader General Augusto Cesar Sandino to come to terms, the Americans could not keep their newly created military out of politics. After National Guard officers assassinated Sandino in 1934, their leader, General Anastasio Somoza, seized power. His family ruled the country, backed by the National Guard, until their ouster in 1979.

The Second World War and Early Cold War, 1941–1954

During and immediately following the Second World War, the work of U.S. military advisors expanded

worldwide as successive administrations dispatched U.S. forces around the globe to combat first the Axis and later the communist threat. During World War II, U.S. military advisors played an active role in training air, land, and maritime forces throughout the world, particularly those of the various Latin American republics. With the war's swift conclusion in the spring and summer of 1945, U.S. military advisors quickly took on new challenges, most notably in the Far East.

Japan

The American role in the construction of Japan's postwar military is a great, if little known, success story. As in Germany, the Allies quickly disbanded the Japanese military only to find that rising Cold War tensions required remilitarization. In July 1950, after initially opposing remilitarization, General Douglas MacArthur, as Supreme Commander for the Allied Powers, ordered Prime Minister Yoshida Shigeru, another opponent of remilitarization, to form a 75,000-man National Police Reserve. Despite Japan's rapid remilitarization, and the presence of former imperial officers in leadership positions, the American U.S. forces succeeded in making Japan's police reserves and its successor, the Japanese Self-Defense Forces, into a military committed to supporting Japan's fledgling postwar democracy.

Philippines

In addition to successfully rebuilding the Japanese military, U.S. advisors successfully strengthened the counterinsurgency capabilities of the Philippine army that, with the end of World War II, found itself locked in combat with a communist-led insurgency. Although the Philippine military's effort faltered initially, with Ramon Magsaysay's appointment to Secretary of National Defense in 1950, the situation quickly improved. In addition to weeding out corrupt and incompetent officers, Magsaysay increased the size of the army and emphasized classic counterinsurgency tactics, including increased use of night patrols and small unit hit-and-run actions. The Joint U.S. Military Assistance Group that had been active in the Philippines since 1947 nearly doubled in size during 1950–1951, as did U.S. material aid to Manila. In addition to aiding Magsaysay's expansion and reorientation of the military, the Joint U.S. Military Assistance Group also supported the highly

successful Economic Development Corps, which settled former rebels on islands other than Luzon, the principal area of guerrilla activity. These combined actions quickly turned the tide, and by 1954, Philippine forces defeated the insurgency.

South Korea

While successful in Japan and the Philippines, American efforts to build a South Korean police force, followed by a regular army, foundered. With the end of Japanese rule, U.S. authorities set about building a Korean Constabulary that, once activated in January 1946, grew to 15,000 men within 18 months. Given that Korea had been under Japanese control from 1905 to 1945, the vast majority of senior positions within the new paramilitary force went to graduates of either the Manchukuo or the Japanese military academies. Two years later, in March 1948, the United States responded to the formation of a Soviet-led military force in North Korea by transforming the constabulary, then numbering 26,000 men, into a full-fledged 50,000-man South Korean army.

From the start, political factionalism, infighting between the Japanese and Manchurian cliques, and inadequate supplies undercut the South Korean army, which also suffered from communist infiltration and the outright rebellion of some units in October 1948. The Republic of Korea's army could not beat back the North Korean advance in June 1950, and Seoul, the South Korean capital, fell within 3 days. Moreover, unlike the case of the Japanese Self-Defense Forces, U.S. authorities could not inculcate the newly constructed Republic of Korea's army with firm democratic principles, and in 1961, Major General Park Chung-hee, a 1942 graduate of the Japanese-led Manchukuo Imperial Army Academy and the Japanese Imperial Army Academy, led a successful military coup that kept the general in power until 1979.

Vietnam, 1950–1973

In many respects, Vietnam remains the quintessential story of the U.S. military advisor. The American advisory role in Vietnam began with the establishment of U.S. Military Assistance Advisory Group, Vietnam, which Washington tasked with overseeing the disbursement of aid to French forces. With the French defeat in 1954 and subsequent withdrawal from Vietnam and division of the former colony into

northern and southern zones, the United States took the lead in 1955 in training the South Vietnamese military. Despite their best efforts, U.S. advisors saw little improvement in the army of the Republic of Vietnam or ARVN, due largely to the obstructionist tactics of President Ngo Dinh Diem.

In response to growing insurgent strength, the United States vastly increased its aid to South Vietnam starting in 1961. With the formation of the U.S. Military Assistance Command, Vietnam, in February 1962, the American advisory role grew and focused on creating a capable counterinsurgency force within the ARVN and the various paramilitary forces, such as the Civil Guard and the Self-Defense Corps. The Americans also oversaw new initiatives such as the Strategic Hamlet program. Within 2 years, the number of American advisors had grown to 16,000, but Diem's continued machinations, combined with political infighting and corruption, stymied the counterinsurgency efforts. Early in 1963, at the Battle of Ap Bac, ARVN forces and American advisors suffered a stinging defeat at the hands of a much smaller Viet Minh force, highlighting the difficulty of the American mission. With the steady growth of U.S. forces, the U.S. Military Advisory Group, Vietnam, merged into the Military Assistance Command, Vietnam.

Despite the war's "Americanization" after 1965, advisors continued to play a vital role, numbering in excess of 8,000 by 1966 before peaking at more than 9,000 in 1969, the year in which Vietnamization or the policy of gradually turning over the war to the South Vietnamese military began. To ready Saigon to combat a combined Viet Cong and North Vietnamese threat, Military Assistance Command, Vietnam focused on expanding the South Vietnamese military from its 1969 total of 875,000 to just over 1 million by 1973, while simultaneously upgrading its leadership and equipment and curbing desertion. Although it successfully increased the size of the Saigon forces, Military Assistance Command, Vietnam could neither curb desertion nor improve leadership by 1973, when the United States ended its combat role in Vietnam. Left alone, the ARVN crumbled in early 1975, and Saigon fell to the victorious communists in April of that year.

Iraq, Afghanistan, and Beyond

Military advisors continued to operate around the globe following the conclusion of the Vietnam War,

most notably in the Middle East and Latin America. With the onset of the Global War on Terrorism and the extended U.S. military commitment in Iraq and Afghanistan, the work of U.S. military advisors increased. In both countries, military advisors train military and paramilitary units, and in both countries, advisors face difficulties that their peers from a generation earlier would no doubt recognize.

In both countries, advisors struggle with religious and tribal divisions, the unwillingness of their host governments to implement vital reforms, and desertion rates that in Afghanistan have reached 25%. To operate successfully in such a difficult environment, the various branches of the armed services have recognized that new training is required.

For decades, the upper echelons of the U.S. armed forces marginalized military advisors as their commanders were confident that American troops and firepower would decide a conflict far more effectively than U.S.-trained indigenous forces. Accordingly, advisors often lacked vital training in the history, culture, and language of their host country. For decades, rank, specialist, and branch qualifications were all that were required for advisor duty.

Assessments of the advisor mission in both Afghanistan and Iraq emphasized the need for greater language training, as well as more time spent on cultural studies. Recently, both the Marine Corps and air force have redoubled their efforts to prepare advisors for overseas assignments. The Marine Corps's new Training and Advisory Group, for example, based at Fort Story, Virginia, aims to strengthen the marines' ability to provide large numbers of advisors. The air force's Combat Aviation Advisor Course, conducted at Hurlburt Field, Florida, provides, among other things, 2 to 4 months of intensive language training. A second air force program, operating out of Fort Dix, New Jersey, provides 23 days of training in preparation for deployment to Afghanistan and Iraq. This innovative program includes daily language work and more than 2 weeks of intensive study of the Middle East's history and culture. Through innovative programs such as these, U.S. military advisors can gain the requisite knowledge to carry out successfully their tasks abroad and continue the tradition of over a century of service to America's allies.

MILITARY COMMAND STAFFS

To manage the complicated nature of military organizations, the armed forces of the United States utilize a staff system to simplify the control of day-to-day operations. The modern command staff attempts to facilitate command and control by enabling a clear line of information, easing a commander's decision-making process. To accomplish this, related tasks or duties are grouped together under a single administrator who then reports directly to the commanding officer. This compartmentalization ideally provides better advice and allows for a more efficient coordination of personnel, equipment, and other resources. These staff sections are found within all branches of the armed forces and at all unit levels, including operational, departmental, and joint commands. While the overall duties at each level may vary, the basic responsibilities are generally similar. This entry describes the historical evolution of the staff system within the U.S. armed forces and briefly discusses the organization of staff responsibilities at various levels within military commands.

The Origins of the U.S. Military Staff

The origins of the modern U.S. military staff can be traced to the American experience in the

First World War. In 1917, the commander of the American Expeditionary Force (AEF), General John J. Pershing, decided to adopt a command staff similar in composition to that used by the French army. Pershing's decision was a direct result of the lack of formal structure within the U.S. Army as well as the need for close cooperation with the French military. The AEF staff, officially created in February 1918, contained four separate sections, each analogous to those contained within the French system, or *État-Major*. Pershing also developed a fifth section for his staff with an emphasis on training due to Allied pressure for the rapid deployment of American troops. Additionally, to maintain an uncomplicated working relationship with the other Allied Powers, the AEF adopted British nomenclature when referring to staff officers. For example, the officer in charge of administration was referred to as G-1, in reference to the British custom of referring to GSOs, or General Staff Officers, as "Gs." The final AEF command structure contained the following sections: administrative (G-1), intelligence (G-2), operations (G-3), supply (G-4), and training (G-5).

The army officially adopted the structure used by the AEF in 1921. The 1932 *Staff Officers' Field Manual* further clarified the staff roles by prescribing the specific functions and designations of the general staff officers while also outlining organization and functions at the brigade, regiment, and battalion levels. Since the responsibilities of the lower level staff officers mirrored those within the general staff, their numerical designation remained the same. However, to distinguish them from the higher echelon commands, the field manual assigned the alpha character "S," which simply stood for "staff." For example, while the general staff intelligence section carried the G-2 moniker, at the lower levels of command the intelligence section was classified as S-2. The Department of the Army utilized this basic structure into the Second World War.

The passage of the 1947 National Security Act and its subsequent amendments represented yet another evolution of the staff structure within the U.S. military. In addition to the establishment of the Department of Defense, the legislation laid the groundwork for the creation of unified and specified commands that included elements from each of the three (later four) services, such as the U.S. European Command or U.S. Northern Command. The commander in chief of each of these operational

commands oversees a joint military staff composed of officers from various branches assigned according to their area of specialty. In addition, the U.S. Joint Chiefs of Staff, formalized in 1947, also employ a joint staff, which assists with the advisory and planning functions of the Joint Chiefs of Staff.

The Modern Command Staff Organization

At each level of command, the staff is essentially the same with regard to basic functioning and structure. The chief of staff or executive officer assists the commander with coordinating the administration and activities of the staff. Each section, whether it be at the joint level (J staffs), major command level (G staffs), smaller units (S staffs), or even within the U.S. Navy (N staffs), is then subdivided into specific areas of responsibility and categorized numerically (1, 2, 3, 4, etc.). The contemporary staff structure contains most of the World War I-era divisions. Personnel, intelligence, operations, and logistics groupings are usually found at all levels of command. In some instances, additional sections may be added or even combined into a single area of responsibility. For example, due to the highly technological nature of the modern military, most staffs contain a communications section (G-6, S-6) or, as in the case of U.S. European Command, J-5/8 combines planning functions with resource management and coordinating activities. At the higher levels, such as major or unified commands, a civil affairs section is often included to enhance relations with civilian organizations. The commander's willingness to delegate and the availability of resources ultimately determines the structure of the command staff at any level. However, the specific delineation of responsibilities within each section theoretically allows for better communication between sections as well as ease of coordination involving additional commands.

MILITARY COURTESY

Military courtesy is an elaborate and ubiquitous code of etiquette that governs relationships between service members. It focuses on the proper conduct between superiors and subordinates and, thereby, reinforces discipline and the chain of command. Each service has its own specific elaboration of military courtesy based on the way its members relate to one another. Military courtesy encompasses every aspect of a military member's life to include the proper times for saluting, wearing headgear, and rules for smoking or riding in cars, planes, and boats, among other things. Military courtesies are based on traditions or customs developed over time that determine what a military may and may not do. Military study guides usually group military customs and courtesies together as the two go hand in hand. This entry describes some of the customs and courtesies common in military life.

Personal Military Courtesy

Over the long history of the services, many traditions have developed, but saluting is the most easily recognized of them all. There are two dominant thoughts on the origins of the salute. One traces the custom back to armored knights in the European Middle Ages raising their visors to identify themselves as friends. The chivalric custom demanded the junior knight raise his visor first and the senior knight returned the gesture. A second line of thought traces the custom back to the Italian Renaissance when the Borgia family dominated Rome. Assassinations were so frequent that men began greeting one another with open palms to show they had no weapon.

Today, the salute is a basic gesture of respect to rank given by an enlisted soldier or junior officer to a superior officer, and each service has detailed rules that prescribe when and where to salute. The salute is rendered with the right hand rigid and fingers extended to touch the head cover visor or

the forehead at the top corner of the right eye. The palm is turned slightly toward the face while the upper arm is extended and held parallel to the ground. The arm is dropped to its original position after the salute is returned. A greeting usually accompanies the salute and is specific to each unit. Salutes are also rendered under arms in a position called "present arms," which is taught during drill instruction.

Other personal courtesies include subordinates addressing superiors as "Sir," "Ma'am," or by rank and last name. Superiors return the courtesy by referring to subordinates by their rank and last name. Removing headgear indoors, calling "attention" for the commanding officer or "at ease" for the unit sergeant major entering a building, and walking behind a senior rank while walking are all additional forms of military courtesy. This minutia works together within a broader framework of discipline to reinforce obedience of orders, a critical function in combat. Military members become immersed in military courtesy as soon as they arrive at initial entry training. Courtesy is reinforced through a combination of classroom lecture, corrective training for mistakes, and drill and ceremony instruction.

Drill, Ceremony, and Military Etiquette

Military courtesy, and thus mutual respect between service members, is reinforced by drill and ceremony instruction. The historical purpose of drill was to train commanders to maneuver men on the battlefield, but in the 20th century, drill instruction focused on the disciplinary function. Today, individual military members drill on specific physical tasks to build the muscle memory required to operate the weapons and technology that are part of the battlefield. Unit drill retains its relation to military courtesy through its instruction on parades and ceremony where proper courtesies to symbols are taught and the chain of command is reinforced.

The national flag is the most important symbol to which military members render courtesy. Martial music also plays a role in the courtesy rendered to the flag. The two most important songs are Reveille, played in the morning as the flag is raised at post headquarters, and Retreat, played in the evening as the flag is lowered. Military members are alerted by the music to assume the position of attention and render a salute at the appropriate time.

Military etiquette is the common courtesy given by military members to each other as members of a professional organization. It includes basic manners such as being on time, saying thank you, and not keeping people waiting. Military members are expected to provide honest assessments of situations, and to exercise candor, but always within the limits of proper etiquette and formal courtesy.

Military courtesy and etiquette also extends to the various social engagements military members are a part of. The three most common events are the military ball, the dining in, and the dining out. Military balls are formal events for unit members and their spouses that include many courtesies between military members as well as symbolic courtesies such as the moment of silence for the table setting for fallen comrades. Dining in events are less formal than military balls and only involve members of the unit. They follow a strict format and emphasize unit and military traditions to build esprit de corps. Dining out events are also less formal than military balls but include the spouses of unit members. These events are intended to introduce family members to some of the traditions and courtesies of the military.

Military courtesy is inextricably linked to discipline and etiquette and reinforces obedience to orders. This lies at the root of all customs and courtesies. Troops on the battlefield must obey the orders of their commanders to achieve success, and immersing them in the proper courtesies between themselves and their superiors is the first step in conditioning this response. Parades, ceremonies, formal events, and the minutia of military etiquette all serve to reinforce this basic precept and are so ubiquitous that they become routine.

MILITARY JOURNALS AND NEWSPAPERS

Newspapers and journals, whether in print or in electronic versions, provide an avenue of communication that builds cultural and social bonds. People enjoy reading about other people, and men and women of the military are no different in their quest for news and information about the world and their profession. There are a number of newspapers, journals, and magazines covering activities of the professional armed service branches, both historical and current, from military and nonmilitary sources. The style of the publications runs from scholarly to news reportage. This entry offers a selection of magazines available in the field. Each selection lists circulation, publisher's address, website, and whether it is produced by a military or nonmilitary source. A nonmilitary source may be an association or commercial publisher.

Air & Space Power Journal. This quarterly began in 1947 and has undergone several title changes but remains the official publication of the Air University, the U.S. Air Force's professional military educational institution. The articles are scholarly in nature written by academics and military personnel of the Air University. Circulation: 20,000. Publisher's address: Air University, Maxwell Air Force Base, 401 Chennault Circle, Montgomery, AL 36112. Military. Website: <http://www.airpower.au.af.mil/>.

Armed Forces & Society. An interdisciplinary journal on military institutions, civil-military relations, arms control and peacekeeping, and conflict management. Articles range from family issues to peace issues. Circulation: 1,700. Publisher's address: Sage Publications, 2455 Teller Road, Thousand Oaks, CA

91320. Nonmilitary. Website: <http://www.sagepub.com/journalsProdDesc.nav?prodId=Journal201730>.

Armed Forces Journal. Originating in 1863, this monthly periodical has weathered name changes to remain a viable organ of news. Short articles cover issues of tactics, strategy, and procurement. Circulation: 27,000. Publisher's address: Defense News Media Group, 6883 Commercial Drive, Springfield, VA 2159. Nonmilitary. Website: <http://www.armedforcesjournal.com/>.

Army. Since 1950, this slick monthly magazine is aimed at soldiers currently serving. Civilians and senior army officers write the articles dealing primarily with current military events. Circulation: 85,000. Publisher's address: Association of the U.S. Army, 2425 Wilson Boulevard, Arlington, VA 22201. Nonmilitary. Website: <http://www.ausa.org/publications/armymagazine/>.

Defense Monitor. Appearing 10 times a year since 1972 and produced by the Center for Defense Information, this journal can be highly critical of military operations. It is intended for both military and general audiences. Circulation: 35,000. Publisher's address: Center for Defense Information, 1779 Massachusetts Avenue, North West, Washington, DC 20036. Nonmilitary. Website: <http://www.cdi.org>.

Fortitudine: Bulletin of the Marine Corps Historical Program. Covering military history for the Marine Corps as well as other branches of service, this quarterly bulletin has been published since 1970. Circulation: 18,000. Publisher's address: Marine Corps History Division, 3078 Upshur Avenue, Quantico, VA 22134. Military. Website: http://www.tecom.usmc.mil/HD/Home_Page.htm.

Infantry: A Professional Bulletin for the U.S. Army Infantryman. A long-time (since 1921) bimonthly periodical devoted to battle operations and the army that fights them. Articles are written by senior officers for teaching and training purposes. Circulation: 13,000. Publisher's address: U.S. Army Infantry School, P.O. Box 52005, Fort Benning, GA 31995. Military.

Joint Force Quarterly. Publishing since 1993, this relative newcomer among service publications

integrates viewpoints and multifaceted maneuvers of all branches of the military. Highly regarded, it is the chief publication of strategic military policy. Circulation: 36,622. Publisher's address: National Defense University, Fort Lesley J. McNair, Washington, DC 20319. Military. Website: <http://www.ndu.edu/press/jointForceQuarterly.html>.

Journal of Military History. A scholarly journal published quarterly since 1937, each issue also features many book reviews. Circulation: 3,200. Publisher's address: Society for Military History, George C. Marshall Library, Virginia Military Institute, Lexington, VA 24450. Military. Website: <http://www.smh-hq.org/>.

Leatherneck: Magazine of the Marines. Throughout its long history (since 1917), the mission of this monthly magazine remains the same: to be the magazine of Marines—yesterday, today, and tomorrow. Circulation: 94,000. Publisher's address: Marine Corps Association, 715 Broadway Street, P.O. Box 1775, Quantico, VA 22134. Nonmilitary. Website: <http://www.mca-marines.org>.

Marine Corps Gazette: Professional Journal of United States Marines. Since 1916, its mission has been to provide a forum for the exchange of ideas that will advance knowledge, interest, and esprit in the Marine Corps. Circulation: 30,880. Publisher's address: Marine Corps Association, 715 Broadway Street, P.O. Box 1775, Quantico, VA 22134. Nonmilitary. Website: <http://www.mca-marines.org/gazette/>.

MHQ: The Quarterly Journal of Military History. Aimed at a general audience, this well-illustrated magazine focuses its articles on great battle and campaigns over the last 5,000 years, from ancient warfare through modern Iraq. Circulation: 39,700. Publisher's address: Weider History Group, 741 Miller Drive, South East, Suite D-3, Leesburg, VA 20175. Nonmilitary. Website: <http://www.history.net.com/magazines/mhq>.

Military History. One of the oldest and most popular magazines devoted to the history of warfare. Articles examine commanders, campaigns, battles, and weapons that made history. Circulation: 176,000. Publisher's address: Weider History Group, 741 Miller Drive, SE, Suite D-2, Leesburg, VA

20175. Nonmilitary. Website: http://www.history.net.com/magazines/military_history.

Military Review: The Professional Journal of the United States Army. Written for the professional soldier, this bimonthly periodical has provided for the open exchange of ideas about military matters of importance to the U.S. Army with a focus on the concepts, doctrine, and warfighting at the tactical and operational levels of war since 1922. Circulation: 27,000. Publisher's address: U.S. Army Combined Arms Center, 290 Grant Avenue, Building 77, Fort Leavenworth, KS 66027. Military. Website: <http://usacac.army.mil/CAC2/MilitaryReview/index.asp>.

National Guard. Since 1947, this monthly publication has featured articles on Guard-related issues, programs, and activities at home and abroad. Circulation: 45,000. Publisher's address: National Guard Association of the United States, 1 Massachusetts Avenue, North West, Washington, DC 20001. Nonmilitary. Website: <http://www.ngaus.org>.

Naval War College Review. Established in 1948 as a forum for discussion of public policy matters of interest to the maritime services, this quarterly periodical presents articles on the academic and professional activities of the Naval War College. Circulation: 9,500. Publisher's address: U.S. Naval War College, 686 Cushing Road, Newport, RI 02841. Military. Website: <http://www.nwc.navy.mil>.

Parameters: The United States Army's Senior Professional Journal. As its title implies, this quarterly journal serves as a vehicle for continuing education for Army War College graduates, other senior military officers, and academia concerned with national security affairs. It features a forum for mature thought on the art and science of land warfare, national and international security affairs, military strategy, military leadership and management, military history, ethics, and other topics of significant and current interest to the U.S. Army and the Department of Defense. Circulation: 13,500. Publisher's address: U.S. Army War College, 122 Forbes Avenue, Carlisle, PA 17013. Military. Website: <http://www.carlisle.army.mil/usawc/Parameters/>.

A MESSAGE FROM OUR CHIEF

ARMY MEN BUILD AN OVER-SEAS PITTSBURGH

IN this initial number of THE STARS AND STRIPES, published by the men of the Quartermaster

These readers are mainly the men who have been honored by being the first contingent of Americans to fight on European soil for the honor of their country. It is an honor and privilege

which makes them fortunate above the millions of their fellow citizens at home. Commensurate with their privilege in being here, is the duty which is laid before them, and this duty will be performed by them as by Americans of the past, eager, determined, and unyielding to the last.

The paper, written by the men in the service, should speak the thoughts of the new American

can Army and the American people from whom the Army has been drawn. It is your paper
Good luck to it. (Signed) **JOHN J. PERSHING,**

of the U.S. Army, since 1946. Matter-of-fact articles for enlisted soldiers are included in this monthly magazine. Circulation: 1,000,000. Publisher's address: U.S. Department of the Army, 9325 Gunston Road, Suite S108, Fort. Belvoir, VA 22060. Military. Website: <http://www.army.mil/soldiers/>.

Stars and Stripes: The U.S. Military's Independent News Source. Earlier newspapers of the same name appeared during the Civil War. The current *Stars and Stripes* began during World War I, then ceased postwar. It began once more in World War II and has been published continuously ever since. This Department of Defense–authorized newspaper publishes four daily editions in the Mideast, Europe, Japan, and Korea. It prides itself on providing firsthand reporting on events in those theaters. In addition to news and sports, *Stars and Stripes* contains all the elements of an American “hometown paper,” from advice columns to comics, horoscopes, and crossword puzzles. It estimates readership at 420,000 daily. Circulation: 90,000. Publisher's address: Stars and Stripes, 529 14th Street North West, Suite 350, Washington, DC 20045. Nonmilitary. Website: <http://www.stripes.com/>.

U.S. Naval Institute Proceedings. A venerable publication (since 1874) highlighting articles on a central theme with additional news stories and book reviews. Circulation: 90,000. Publisher's address: U.S. Naval Institute, 291 Wood Road, Annapolis, MD 21401. Military. Website: <http://www.usni.org>.

War in History. International in scope and historical in nature, this quarterly periodical is a scholarly publication that intends that military history should be integrated into a broader definition of history, embracing economic and social themes. Circulation: 600. Publisher's address: Sage Publications, 1 Oliver's Yard, 55 City Road, London EC1 1SP, UK. Nonmilitary. Website: <http://www.uk.sagepub.com/home.nav>.

MILITARY OCCUPATIONAL SPECIALTY

The U.S. military uses a system of codes to identify occupations within the military. Each branch of the military uses a different system, of which that of the U.S. Army and the Marine Corps are most similar: the Military Occupational Specialty code, or MOS. Despite their similarities, the two services do retain certain unique aspects in their categorization of those who serve. In fact, each of the separate armed forces handles and categorizes personnel in a particular way, creating many differences between them. There are, however, broad aspects of personnel management that each system shares. This entry describes the classification systems of jobs in the U.S. armed forces.

Cross-Service Similarities

Each service uses a code, a mixture of letters and numbers, to denote the role of the service member within the organization. The services use codes of different lengths and compositions, but the specification of that service member's form of employment (e.g., fixed-wing aircraft maintenance) also delineates whether the organization assessed that particular posting to require an enlisted person or a commissioned officer to discharge the associated duties.

Those duties range from administrative to combat specialties, running a gamut that includes but is not limited to electronics repair, health care, construction and engineering, vehicle and machinery mechanics, public affairs, protective service, support staff, and transportation and load handling. Each of these fields contains jobs that are specified for enlisted personnel as well as tasks for commissioned officers.

The ways in which each service makes these specifications vary in the U.S. armed forces.

U.S. Army

The army uses a nine-digit code to describe a soldier's role in the organization within 37 major regions. The first three digits of the code—two numbers and a letter—constitute that soldier's Career Field Designator and range from 00A to 94Z. This Career Field Designator is the most common understanding of the MOS. The two initial numbers indicate the Career Management Field, and the third digit, the letter, specifies the role within that career field. For example, an 11B soldier lies within the Infantry career field and is a rifleman, the role specified within that field by the "B."

Commissioned officers within the U.S. Army are categorized by the same nine-digit code, save that the third digit (the first letter) is constrained. In every MOS, most officers will be specified with an "A," save in special cases such as the Military Intelligence career field, whose officers specializing in Human Intelligence are categorized as 35F.

For enlisted and commissioned soldiers, the next two numbers in the MOS fulfill different functions. For the officer, the fourth and fifth digits are numbers that, taken together, form a skill identifier denoting a particular ability or level of training required for the role. For enlisted soldiers, the fourth character is a number that indicates the skill or grade level within that MOS, while the fifth character denotes any special qualifications.

For each, the sixth and seventh characters denote some other secondary skill tied to the role within the MOS, while the eighth and ninth characters indicate a level of ability within a foreign language. Taking each of these into consideration, that same infantry rifleman could be categorized as an 11B300000, for an infantry sergeant without special skills.

U.S. Navy

The navy, on the other hand, uses a system of organization called the Naval Enlisted Classification within which it groups sailors as *ratings*. Each rating can be identified by the four-digit Naval Enlisted Classification code; for example, a surface rescue swimmer would be identified through BM-0170.

The navy organizes commissioned officers differently, with a four-digit "designator" to which an officer can add one or more three-digit Additional Qualification Designators. These Additional Qualification Designators may or may not be specific to certain designations; a regular submarine officer, 1120, could also hold an Additional Qualification Designators of CE5, identifying his position as a shore command.

U.S. Marine Corps

As a part of the naval organization, it is strange that the Marine Corps system closely parallels that of the army. Both use the MOS; the marines, however, make no distinction in their occupational fields between enlisted and officer ranks. The Marine Corps uses a different, though similar, set of numbers to fulfill the same nine-digit designator used by the army, such that the rifleman considered above would have a classification of 0311, while the remaining digits, as with the army, indicate special skills, language ability, and additional specialization.

U.S. Air Force

The air force utilizes a system of classification called the Air Force Specialty Code in which enlisted service members are classified with a five-digit alphanumeric code into their Air Force Specialty. A designation of 1A771 indicates an aerial gunner. The first digit places the job within the operations career group; the second specifies aircrew within operations; the third notes the position of aerial gunner; the fourth notes the skill level of the service member as a craftsman, a senior airman; the fifth is a skills designator specific to that AFS.

Air force officers are classified via a four-digit system, such that a fighter pilot would be designated 11F3. Again, the first digit denotes operations as the career group; the second specifies pilot, within operations; the third specifies the type of pilot, in this case fighter; and the final digit notes that the pilot is qualified.

Use of MOS in the U.S. Armed Forces

Within the U.S. services, certain aspects of their personnel management cross between services. For example, the career fields dealing with administrative

and support service functions are more widely distributed than the combat specialties. Every unit, everywhere, needs the personnel that allow it to function within the organizational bureaucracy—but M1A1 Abrams tank drivers are only needed where tanks are located.

Each service tests new recruits with a battery of aptitude tests before determining how to place that recruit within the organization; generally, the higher the score, the more opportunities are available to that recruit. The services, however, tend to husband their organizational needs and so will place recruits in areas of need, unless barred by contract.

The U.S. military classifies and organizes personnel by these codes so as to efficiently provide manpower to serve in defense of the nation.

MILITARY OFFICERS ASSOCIATION OF AMERICA

The Military Officers Association of America (MOAA) is an association of military officers from the seven uniformed services of the United States. The seven services are (1) the Army, (2) the Navy, (3) the Marine Corps, (4) the Air Force, (5) the Coast Guard, (6) the Public Health Service, and (7) the National Oceanic and Atmospheric Administration. Membership is open to all those who hold or have ever held a warrant or commission in any component of the seven uniformed services and their surviving spouses. The association is an independent, nonprofit, and politically nonpartisan organization.

This entry describes the mission, structure, and activities of MOAA.

Headquartered in Alexandria, Virginia, the mission of the association is to advocate for a strong national defense; preserve the earned entitlements of members of the uniformed services, their families, and surviving spouses; and represent the interests of uniformed officers at every stage of their careers. Its focus is on monitoring and influencing military personnel matters and legislation affecting the MOAA community. The association is governed by a board of directors consisting of 36 officers from the seven uniformed services with four of the serving officers—the chairman of the board and three vice chairmen—being elected by the board. Also elected by the board from outside of its membership are the president, the chief financial officer, and the secretary, all of whom serve on MOAA's professional salaried staff and advise the board. The members of the board of directors all serve one 6-year term. Reporting to the board is the Auxiliary Member Advisory Committee, which reports on issues affecting surviving spouses of military members.

While MOAA is permitted by law to lobby, which it does actively, its status as a tax-exempt veterans' organization precludes it from participating in political activities defined as intervening directly or indirectly in any political campaign on behalf of or in opposition to any candidate running for public office. The association may advocate issues, but it may not advocate the election or defeat of participating candidates or political parties. While the association does advocate for a strong national defense, it does not become involved in matters pertaining to military strategy or individual weapons systems of the various services. MOAA's overarching goals are captured in the association's resolutions, which reflect the views of the entire membership. The membership provides input and votes on the organization's resolutions every 2 years.

The MOAA was founded in Los Angeles, California, on February 23, 1929, as The Retired Officers Association. The first leaders of the association hoped that by organizing and joining together, they could provide assistance and advice to other military officers. The concern for others fostered natural fraternal relations among officers from all the branches of the uniformed services. By 1944, its membership was more than 2,500. But by the beginning of World War II, the association's

leadership realized that it needed to reorganize to become a more effective force on behalf of its members. It moved the association's headquarters to Washington, D.C., in 1944. After a membership vote in September 2002, the association's name was changed from The Retired Officers Association to the Military Officers Association of America effective from January 1, 2003. MOAA now has more than 400 local chapters within the United States and many chapters overseas.

MOAA today is America's largest military officers' association lobbying on behalf of its membership and all officers within America's uniformed services. For its membership, it provides career transition assistance, member products for use and display, military benefit counseling, educational assistance to children of military families, and military professionalism activities. The association also offers a variety of publications for its members on financial planning, military retirement planning, military health care, survivors' benefits, and National Guard and Reserve benefits, all of which are available at no cost to the members. It publishes on a quarterly basis the journal *Today's Officer*, which is mailed to the members free of charge. Currently, it has eight full-time lobbyists dedicated to protecting the interests of all officers of the uniformed services, active duty or retired, and their families and survivors.

MILITARY ORGANIZATION, AIR FORCE

Established in 1947, the Department of the Air Force is administered by a civilian secretary who, like the navy and army counterparts, is appointed by the president with the consent of the Senate; the secretary of the air force (SECAF) is the senior authority in Headquarters Air Force (HAF), located at the Pentagon. The SECAF is not part of the operational

chain of command. Rather, in accordance with U.S. Code Title 10, the SECAF is responsible for all U.S. Air Force (USAF) affairs and functions. These include recruiting, organizing, supplying, equipping, training, servicing, mobilizing and demobilizing, administering, and maintaining. In addition, the SECAF oversees the construction, repair, and maintenance of the service's military equipment and real property. Civilian assistants and the air force chief of staff assist the secretary. This entry discusses the organizational structure of the USAF.

With the consent of the Senate, the president also appoints the chief of staff, USAF, choosing from among USAF generals. In addition to assisting the secretary and directing the Air Staff, the chief of staff, USAF, is a member of the Joint Chiefs of Staff. The air force chief of staff is also part of HAF. Thus, two staffs constitute HAF—the Secretariat and the Air Staff.

The USAF is structured so that the various units and organizations can transition immediately from peacetime activities to deploying for war. The chain of command flows up through standardized levels of organization that include establishments, units, and nonunits. An establishment comprises a headquarters unit and all of its subordinate units. The highest establishment is HAF. Staff functions are the responsibility of Major Commands (MAJCOM), wings, and squadrons. Numbered or named air forces (NAF), groups, and flights serve only operational functions. A MAJCOM is immediately subordinate to HAF, with NAFs subordinate to MAJCOMs and so on with wings, groups, squadrons, and flights.

MAJCOMs report directly to HAF. In 2011, the air force had 11 MAJCOMS, including the two reserve components. They were the following: (1) Air Combat Command, (2) Air Education and Training Command, (3) Air Force Global Strike Command, (4) Air Force Materiel Command, (5) Air Force Reserve Command, (6) Air Force Space Command, (7) Air Mobility Command, (8) Air National Guard, (9) Pacific Air Forces, (10) U.S. Air Forces in Europe, and (11) Air Force Special Operations Command.

Direct Reporting Units (DRUs) report directly to the chief of staff, USAF. Although a DRU is similar to a MAJCOM in its responsibilities, its mission does not fit into any of the MAJCOMs. For instance, the United States Air Force Academy is a DRU. The

other DRUs are Air Force District of Washington and the Air Force Operational Test and Evaluation Center.

A Field Operating Agency is another subdivision of the air force that reports directly to HAF. The air force has 25 Field Operating Agencies: (1) Air Force Agency for Modeling and Simulation; (2) Air Force Audit Agency; (3) Air Force Center for Engineering and the Environment; (4) Air Force Civil Engineer Support Agency; (5) Air Force Cost Analysis Agency; (6) Air Force Flight Standards Agency; (7) Air Force Historical Research Agency; (8) Air Force Inspection Agency; (9) Air Force Intelligence, Surveillance, and Reconnaissance Agency; (10) Air Force Legal Operations Agency; (11) Air Force Logistics Management Agency; (12) Air Force Manpower Agency; (13) Air Force Medical Operations Agency; (14) Air Force Medical Support Agency; (15) Air Force Office of Special Investigations; (16) Air Force Personnel Center; (17) Air Force Personnel Operations Agency; (18) Air Force Petroleum Agency; (19) Air Force Public Affairs Agency; (20) Air Force Real Property Agency; (21) Air Force Review Boards Agency; (22) Air Force Safety Center; (23) Air Force Security Forces Center; (24) Air Force Services Agency; and (25) Air Force Weather Agency.

The most familiar units are NAFs, wings, groups, squadrons, and flights. NAFs are the tactical units that report to MAJCOMs, with responsibility for operational leadership and supervision. There are 24 NAFs. The echelon immediately below a NAF is a wing. There are three types of wings. Operational wings have an operations group and an associated mission. An air base wing has a support function, such as operating and maintaining a base. The third type of wing is the specialized mission wing. As its name implies, such a wing has a specialized mission such as training and typically does not have assigned aircraft.

The air force defines a group as a tactical echelon between wings and squadrons, comprising multiple lower echelon units to fulfill a broader role such as mission support. A squadron is the building block of air force organization and has a specific operational function, such as a flying squadron, or a support function, for instance a civil engineer squadron. If squadrons require further subdivision so that personnel may perform a specific mission, the unit is called a flight, the lowest level unit recognized by

the air force. Because flights are numbered or named, they are assigned to a group rather than to a squadron.

Units are named or numbered, and are typically constituted by HAF, USAF, or by a MAJCOM. There are eight types of units: (1) active, (2) inactive, (3) disbanded, (4) parent, (5) provisional, (6) attached, (7) detached, and (8) primary subordinate. An active unit is an organization constituted and activated by HAF. Inactive units are organizations that are constituted by HAF but not yet activated, or having been active are inactivated. A disbanded unit is a retired unit. Parent units administer organizations assigned to them. Temporary units created to perform specific tasks receive the designation of provisional unit. An attached unit is removed from its parent unit's control and is placed under the control of another organization for specific functions such as logistic support while remaining officially assigned to the parent unit. All air force personnel must be assigned to a unit.

Any organization that is not constituted by HAF, USAF, is a nonunit. There are five types of nonunits: (1) named activity, (2) detachment, (3) operating location, (4) squadron section, and (5) air force element. Named activities are parts of units that are given designations clearly identifying their mission, for instance, the Civil Engineer School that is part of the Air Force Institute of Technology. Detachments are not located with their parent units, and a detachment commander has nonjudicial punishment authority over detachment personnel. An operating location is also geographically distant from its parent unit, but its commander does not have nonjudicial punishment authority. A squadron section has administrative control over all unit members. Higher level organizations such as groups and wings also have sections. Air Force Element identifies USAF personnel who are on duty with organizations outside of the air force.

MILITARY ORGANIZATION, ARMY

The dictionary defines a *hierarchy* as a graded or a ranked series in which objects are above, below, or equivalent to one another. This definition readily applies to most human systems from business to religion to government. The military organization of the U.S. Army represents one of the more rigid examples of a hierarchical organization. From higher-level national command structures through basic unit building blocks, the army culturally, traditionally, and legally has maintained a chain-of-command organizational structure throughout its many historical changes. Gaining a clear understanding of the army as a military organization requires an understanding of its mission, command structure, the current modular transformation, how the organization as a whole is managed, and its component units. This entry discusses the organizational structure, mission, and management of the U.S. Army.

The mission of the U.S. Army, derived from the Constitution and mandated by Congress under Title 10 of the U.S. Code, is to organize, train, and equip forces for sustained land combat operations in defense of the United States and the accomplishment of national objectives and policies. The army organizes its forces based on the capabilities required to carry out the national military strategy of the United States—protect the country against external acts and aggression, prevent conflict and surprise attacks, and prevail against adversaries.

Major Commands

As a military organization, the army does not exist in a vacuum but rather participates as one service in the National Command Structure running from the president as the commander in chief through the secretary of defense to the secretary of the army and the chief of staff of the army. A parallel line in the chain of command extends directly from the president to the various unified combatant commanders. These four-star-equivalent officers command the U.S. forces oriented to different geographic regions throughout the world. In a similar bifurcated structure, the army

consists of an operating force and a generating force. The operating force is composed of all numbered armies, corps, divisions, brigades, and other subordinate and support units that deploy to conduct military operations. The generating force is those army organizations that are force providers; they develop, train, and sustain the operating force. Under the Headquarters, Department of the Army, are three subordinate organizational levels that constitute the operating and generating force: (1) Army Commands, (2) Army Service Component Commands, and (3) Direct Reporting Units. There are three army commands—Training and Doctrine Command, Army Materiel Command, and Forces Command—that, respectively, recruit, equip, and train/sustain army units as part of the generating force. The nine Army Service Component Commands, such as U.S. Army Central, are responsible for oversight and control of all army operations in their assigned geographical or functional area. Direct Reporting Units consist of commands with very specialized functions such as the Installation Management Command, the Criminal Investigation Command, and the Test and Evaluation Command. As of 2011, there were 11 Direct Reporting Unit organizations.

To effect its “organize” mission, the army conducted a decade-long transformation to a modular force concept beginning in the mid-2000s. Prior to the attacks of September 11, 2001, the army’s combat organizations and support structure centered on 18 divisions. Conducting stability operations in the Iraq and Afghanistan Wars after the conventional defeat of large enemy formations required a mix of capabilities that division deployments could not meet. Coupled with the need for a more robust force rotation schedule, the army developed the modularity concept that focused on brigade-sized units as the primary warfighting formations instead of divisions. Under this concept, like units are scalable and can be broken down into smaller blocks with the same capabilities. Elements of varying sizes and capabilities are thus assembled under a headquarters element, correctly building the resulting unit for joint and expeditionary military operations.

From Fire Team to Army Group

Building, training, and equipping these army forces requires many processes that are managed through an eight-function organizational life cycle model

applying equally to personnel, units, equipment, or facilities. First, a *force management* decision is required to determine what the army will look like and what capabilities it must have. In this representative example, a single infantry soldier is needed. Through the function of *acquisition*, the soldier, a woman for this example, is recruited from the national populace. She must then receive *training* that provides the critical skills and competencies required by a soldier. Then, the soldier is *distributed* to a unit with an identified claim or personnel shortage. At this point in the cycle, resources are applied to both the individual soldier and the unit with the goal of increasing their readiness to carry out the function of *deployment*. In a deployment, the soldier and the soldier's unit are projected anywhere in the world to support national policies and objectives. Whether deployed or at a home station, the soldier must be *sustained*. This requires providing additional resources such as food, clothing, and shelter as well as equipment, training areas, and support facilities. The soldier may decide that she likes being part of a military organization and may decide to make it a career. To be of long-term beneficial use to the army, the soldier requires further *development* of skills and education. Finally, at some point and time, the soldier's career is over, and she must *separate* from the army, though the service and the soldier may retain some postseparation responsibilities to each other.

Though described sequentially in the previous example, the functions of the organizational life cycle model are actually interrelated in practice. One soldier is added with others to form the units that make up the forces of the army military organization. The smallest military unit is a fire team or a crew. The fire team consists of 4 or 5 soldiers organized for combat. A crew is similar but is based around a particular military vehicle such as a tank or artillery piece. A squad, or section, is composed of between 8 and 16 soldiers and is usually led by a noncommissioned officer (NCO) with the rank of sergeant or staff sergeant. The combination of two to four squads forms a 20- to 60-soldier organization known as a platoon. The platoon is the first level of military organization where an officer is designated as the primary leader. Either a first or second lieutenant serves as a platoon leader, assisted by a platoon sergeant at the rank of sergeant first class.

A company-level organization is formed from the addition of a headquarters section to the combined strength of three to five platoons with an end number of 70 to 250 soldiers. While a majority of organizations of these sizes are called companies, some are called batteries or troops corresponding to their special association with the branches of field artillery (fires) and cavalry (armor). This is the first organizational level where the army designates the leader of the unit as a commander. The commander of a company, battery, or troop holds the officer rank of captain and is assisted by a senior NCO known as a first sergeant.

Combining anywhere from four to seven companies along with a headquarters company and a staff forms the organization known as a battalion (or a squadron if a cavalry unit) consisting of between 500 and 1,200 soldiers. The companies within a battalion can be of a similar or separate nature. For example, an infantry battalion could consist of a headquarters company, a medical company, a sustainment company, and four infantry companies. Because of these robust tactical and support capabilities, a battalion is the lowest organizational unit capable of limited independent action. It is commanded by a lieutenant colonel with a senior NCO advisor known as a command sergeant major.

The next organizational level is known as a regiment or group. This terminology is largely from the army's past but is still used at some administrative and training levels like Special Forces groups. The more current term in use to represent the combination of several battalions is a brigade or, more commonly, a brigade combat team. Consisting of 3,200 to 4,200 soldiers, a brigade combat team is the main deployable combined arms organization of the U.S. Army. Commanded by a colonel with a command sergeant major as the senior NCO, a brigade combat team is capable of independent, sustained combat operations when organized as an Infantry (light), Stryker (motorized), or Heavy (armor) brigade. Other types of brigade provide support such as Sustainment Brigades (supplies, transportation, and maintenance), Maneuver Enhancement Brigades (engineers and military police), Fire Brigades (artillery), Combat Aviation Brigades (attack helicopters), and Battlefield Surveillance Brigades (military intelligence, signals, and unmanned aerial vehicles).

A division is commanded by a two-star major general and consists of a headquarters element of

300 to 500 soldiers. Depending on its mission and configuration, a division's strength is 12,000 to 24,000 soldiers when between two and seven brigades are assigned. Once the primary maneuver force at the tactical level, divisions serve as mission command headquarters to direct brigade-centric operations.

Two to five divisions are organized into a corps between 20,000 and 50,000+ soldiers and are commanded by a three-star lieutenant general. When augmented by additional personnel from other services, the 1,000-person corps staff can form the nucleus of a joint task force. A joint task force is composed of units from two or more services (*note*: the U.S. Marines and Navy working together are considered "sea" services and not joint). Some Joint Task Forces are standing headquarters for specific missions such as prisoner of war accountability, though most form just to solve a crisis in a geographical region and disband on mission completion. The joint task force structure is very flexible and is frequently the "face" to international governments and nongovernmental organizations.

An army, sometimes called a field army, consists of 2 to 4 corps and may number in excess of 100,000 soldiers. It is commanded by a four-star general officer who may also assume the role of the land component commander in a theater (in charge of all ground forces). The army currently has only three numbered armies that are primarily planning and administrative headquarters with no troop units assigned.

Out of all the aforementioned military organizations, it is the division that holds the most affinity for soldiers and is probably best recognized by the average civilian. The current transformation of the army from a division-centric force to a brigade-centric force is just one point on a long time line of historical developments concerning divisions. The modern division originated in the early 1900s after a poor performance by combat formations in the Spanish-American War of 1898. Planners designed a combined arms organization with no specific fixed strength, but with a movement factor of 14 miles per day as determined by the infantry marching speed of the day. Over the next 50 years and three wars, changes to the division structure were initiated because of the introduction of new technologies (e.g., the tank), new capabilities, and in reaction to new enemy weapons. Frequently,

these changes were categorized by modifications to the number of combat formations within the division. U.S. divisions deployed to France in World War I were known as square divisions due to their four infantry regiments. Interwar discussions concerning the structure of divisions resulted in a reduction of one combat regiment while adding other specialized units, and the triangular division was created. Though some structural adaptations were made during World War II, including the development of a new airborne division, the triangular division lasted through the end of the Korean War. During the late 1950s, the army reorganized its divisions with each containing five smaller battle groups to ensure dispersal on the atomic battlefield. This pentomic division proved both unwieldy and unsuitable for other operations and was abandoned in the early 1960s in favor of the ROAD structure—Reorganization Objective Army Divisions. ROAD returned to three combat formations, now labeled brigades. Additionally, many other combat battalions and support organizations were allocated into a division base from which support could be tailored into task forces. ROAD formations were first employed in Vietnam along with a new type of organization, the air assault division, where soldiers flew into battle aboard helicopters. Though renamed as the Army of Excellence, the flexibility of the ROAD enabled this design to endure through the remainder of the Cold War with only slight modifications. In 1994, the army began a project titled Force XXI and designed to create military organizations for the 21st century. It is from this project that transformation and modularity arose.

Though the military organization of the U.S. Army is hierarchical, it is not static. To remain relevant, the army must constantly change to reflect the strategic environment of today and tomorrow. Organizational change is rarely easy, especially so for a military organization like the army, but the structures, units, and processes described here have withstood the test of time and allowed the army to effectively carry out its mission of defending the nation.

MILITARY ORGANIZATION, MARINE CORPS

The U.S. Marine Corps is organized into four components: Headquarters Marine Corps, the Operating Force, the Supporting Establishment, and the Marine Corps Reserve. Headquarters Marine Corps entails the offices of the commandant, the assistant commandant, their staffs, and all personnel who are assigned to assist these senior officers in the formulation of Marine Corps doctrine, equipment, basing needs, relations with other U.S. military services and U.S. government agencies, liaison with the political leadership of the country, and contact with foreign military forces for activities such as joint training and maneuvers.

Even more important is the composition and organization of the Operating Force, especially the fact that in both peacetime and war, it is more clearly organized into what the Marine Corps calls the Marine Air-Ground Task Force. This is what is often called “combined arms” unit organization such that at any level—Marine Amphibious Unit, Marine Expeditionary Unit, Marine Amphibious Brigade, or Marine Expeditionary Force (MEF)—Marine Corps forces always have at the ready a mix of forces that include infantry, field and air defense artillery, armor and amphibious assault, combat engineer, intelligence, medical, administrative, and both fixed- and rotary-wing assets. This mix of combined arms forces has been the reality of Operating Force organization since the Second World War, though without all of the nomenclature. This entry

discusses the organizational structure of the U.S. Marine Corps.

Three divisions of Marine Corps ground forces and three air wings of Marine Corps aviation assets (both fixed and rotary winged) constitute the Operating Force. These units are organized into MEFs, each of which consists of a ground division grouped with an air wing, totaling approximately 46,000 marines and sailors. These MEFs are stationed on the east coast of the United States, the west coast of the United States, and in the Okinawa Prefecture of Japan. The Operating Force also consists of the 1st Marine Amphibious Brigade, which is stationed in Hawaii. The Operating Force in turn is very often organized and deployed in smaller combinations of units such as Marine Expeditionary Units or Marine Amphibious Units, which typically consist of a ground force battalion or regiment married to a squadron or air group of aviation assets. Typically, three battalions plus support forces constitute a regiment, and three regiments with support forces make up a division. Along the same lines, three squadrons of aircraft with support forces will constitute an air group, while three air groups and support forces will make up the air wing. Also, very typically, especially in peacetime, these smaller units such as the Marine Expeditionary Units will deploy aboard U.S. Navy amphibious assault ships as part of a carrier battle group or some other deployed U.S. Fleet organization. The logic here is that major groups of American naval vessels that are deployed to far reaches of the globe will have on hand Marine Corps forces that can be deployed at the discretion of the battle group or fleet commander for missions such as fast response power projection ashore, stabilization operations, or the evacuation of American or allied military or civilian personnel.

The Supporting Establishment ties in quite significantly with Headquarters Marine Corps, in that it is the part of the Marine Corps that ensures that the Operating Force has the logistical capability to perform its missions. This, in turn, translates into the offices and personnel who ensure that the marines have the uniforms, equipment, weapons, supplies, and support from Headquarters Marine Corps, other services, other U.S. government agencies, and even foreign governments when necessary.

The Marine Corps Reserve represents a fourth division of ground forces and a fourth air wing, all with similar if not identical equipment, numbers,

and training as the Operating Forces. In a full mobilization, this fourth MEF would take its place alongside the three active-duty MEFs for whatever duty it was assigned. Short of full mobilization, individual Marine Corps reservists or their units can be mobilized to reinforce active-duty units.

The Marine Corps has had a long relationship with the U.S. Navy, dating back to the late 1700s when the marines guarded naval bases, performed security and gunnery functions on naval vessels, provided small landing parties for operations ashore, and performed even more ceremonial duties such as orderlies for ship's captains and flag officers. As the Marine Corps grew into a larger force with a more specialized mission of amphibious assault against hostile-held shores in the 1900s, Marine Corps presence on U.S. Navy ships shrank, though Marine detachments were not entirely removed from American warships until the late 1990s, when the end of the Cold War and budget and personnel cuts demanded that shipboard marines be retained in the Marine Corps Operating Force. Moreover, during the 1990s and 2000s, marines have remained on some American warships, especially marine air wings assigned to the Fleet's aircraft carriers. The marines in this case have been employed to backfill shortages in naval aviation, and at times, the marines have provided a significant percentage of carrier air assets for the Fleet, sometimes approaching 20% to 30% of the air wings serving deployed with the U.S. Navy's carrier groups.

The Marine Corps' focus on amphibious operations has also entailed refinement in command relationships. During World War II, for instance, it was not always clear in the context of amphibious operations when the authority of the naval commander ceased and the authority of the Marine Corps commander became active. The same controversy plagued army-navy relations in these types of operations. Eventually, it was decided that the naval force commander was in charge of all forces until a majority of embarked ground troops were ashore, by which time, the amphibious force commander would take over ashore. This system has persisted through the Cold War and post-Cold War eras.

Finally, it needs to be emphasized that a key to Marine Corps organization is the infantry squad and that Marine Corps organization also entails a very strong emphasis on both small and large unit training, tactics, leadership, and cohesion. The marines

have prided themselves on the idea of the squad of rifle-wielding infantry as the basic building block of the corps, with noncommissioned and junior officers as the key personnel in these situations. In addition, the Marine Corps has focused on the building of *esprit* in larger units such as battalions and regiments. Present-day Marine Corps doctrinal publications, such as *Warfighting*, and publications from the past, such as the *Marine Corps Manual* and the *Small Wars Manual*, attest to this central role for both small and large cohesive units that continue as part of the Marine Corps ethos into the early 21st century.

MILITARY ORGANIZATION, NAVY

A navy is the branch of the armed forces designated for operations conducted at and from the sea. The nature of this military organization and the manner in which it operates is very different from either armies or air forces. This depends on the unique features of the maritime environment, which in turn affects the characteristics of naval platforms.

The sea is a vast, freely accessible and, for the majority of time, empty realm that covers more than 70% of the world's surface. It offers a single continuous global medium for mobility and access, with currently more than 90% of global trade (by volume and value) transported in large container ships. As an operating environment, the sea does not offer the conditions to host a permanent human population; ships sailing through it do not leave footprints in the ground and tend to cover large distances. Last but not least, the sea is a tridimensional realm that, throughout the 20th century, has become increasingly more accessible not merely on its surface but also below and above it.

This unique working environment has had an enduring impact on naval organizations in terms of attitude toward innovation, science and technology, platform design and functions, organizational culture, and structure. This entry examines these features of modern navies and provides an overview of naval organization, focusing on both sea- and shore-based institutions and the rationale for this organization.

Innovation, Science, and Technology

Seamanship—the art of sailing—is based on the practice of highly technical and science-based skills at sea. These are necessary to enable professional sailors to take advantage of hydrography, marine topography, and astronomy. Science and technology are equally crucial for the development of combat systems. Similarly, an in-depth technical knowledge is instrumental to possessing the means to limit the impact of weather conditions and navigation on ships and people. As such, throughout history, naval organizations paid particular attention to matters of innovation, science, and technological development. From the adoption of the first compass to the testing of the sonar system, to the development of well-balanced, vitamin-rich diets, and to the introduction of nuclear engines, navies firmly stood at the forefront of scientific and technical innovation. Today, navies remain as technology-intensive military organizations, and their officer corps and enlisted personnel continue to be preeminently trained in scientific matters.

Platform Design and Functions

Warships are the most defining feature of a naval organization, though today's navies have grown to include air, underwater, and amphibious assets. They are different from any other military platform used by armies or air forces, in that they are not merely designed for combat. To any sailor, a ship is home. In fact, unlike a tank or an aircraft, warships are designed to perform all routine functions of daily life and to sustain themselves at sea for lengthy periods of time. Indeed, there is a symbiotic relationship linking combat effectiveness, quality of living standards, and endurance. From the building of an oar-propelled ship to the blueprints of a nuclear-powered aircraft carrier, the design of a warship represented a crucial balancing between combat

performance and sustainability at sea. Galleys were limited in operational endurance by their food (and water) supplies as much as a submarine in World War II, and battleships could operate only as far as their coal and oil supplies allowed them in a fashion similar to a modern frigate or a destroyer.

Organizational Culture

As a result of the nature of the naval profession, navies developed a distinct organizational culture. This permeates aspects of life beyond the professional sphere, and it is often influenced by regional seafaring customs. At sea, a ship's company is therefore a reproduction in scale of a nation's social fabric, both in terms of its state institutions and of its people. It is no coincidence that major capital ships have often risen to be iconic symbols of national power and status, with warships like HMS *Victory* and USS *Constitution* representing enduring embodiments of national achievement. Concurrently, warships are places where accommodation, food, drink, and recreational activities follow preferences that are specific to national habits; and for this reason, they become a showcase of national culture in interaction with other navies and nations overseas. Ashore, naval personnel tend to live in relatively isolated communities usually close to bases and local seafaring areas. As such, naval communities are at times considered closed or even parochial. In this respect, during the interwar period, the U.S. secretary of state Henry Stimson is reported to have described the navy leadership to be responsible for

the peculiar psychology within the Navy Department, which frequently seemed to retire from the realm of logic into a dim religious world in which Neptune was God, Mahan [America's foremost naval strategist] his prophet, and the United States Navy the only true church. (Stimson & Bundy, 1948, p. 506)

Structure

In the age of sail, navies conducted operations at sea and were tasked to land forces ashore. They were structurally composed of two main branches: (1) the fleet, which included frontline combat forces; and (2) the shore establishments, which provided the technical, maintenance, education, and other administrative functions to support the fleet. The

introduction of new platforms and specializations, most notably the submarine and the aircraft, led to the expansion of the original fleet structure centered on the surface ship to accommodate the specificities of operations conducted above and below the surface of the oceans.

Modern navies are complex military organizations controlling a large variety of capabilities and conducting very different types of missions, from convoy escorts to power projection and from strategic deterrence to commando operations. Navies are the only military organizations to operate at sea, on land, and in the air. This complexity notwithstanding, their organizational structure is still preeminently based on the distinction between fleet and shore establishments.

The commander in chief of the fleet is responsible for all the fleet's components and responds to the navy's chief of staff—the head of the organization. Fleets are usually subdivided according to the branch of specialization. These can include surface, air, submarine, mine warfare, amphibious, special, and training forces and refer to a “type commander.” These commands are responsible for the readiness of the assets. In more recent times, the need to profit from the development of advanced communication systems to foster integration and effectiveness among different naval assets and capabilities, and among the different armed services, prompted naval organizations to venture into a “fourth dimension” of naval warfare. In the case of the U.S. Navy, a naval “network warfare” command was established to deliver “information dominance” in naval and joint operations.

Operationally, each fleet's assets are under the responsibility of specific groups that vary in size, ranging from a small division or a squadron of two units to a flotilla or a battle group—depending on the type of vessels assigned to them. In the case of the United States, the navy operates multiple fleets, some forward deployed or forward based. For this reason, it has an additional organizational layer over the fleet structure represented by two main theater-level fleet commands, Atlantic (recently renamed Fleet Forces Command) and Pacific.

In the U.S. Navy, air assets and platforms have a uniquely central role within the fleet structure. Since World War II, the ability of aircraft carriers to project striking power beyond the line of the horizon has transformed them into the centerpiece of American

naval power. Today, the U.S. Navy has a dedicated command. The Commander Naval Air Forces operates 11 nuclear-powered aircraft carriers (6 assigned to the Pacific fleet and 5 to the Atlantic fleet), each with a displacement of more than 100,000 tons and manned by approximately 3,200 crewmembers. Carriers have an additional 2,500 members of the air wing, essential to operate their air groups composed by 90 fixed-wing aircraft and helicopters. They are the single most complex naval platform ever to set sail, possessing the ability to perform all the functions of the modern navy, from power projection and forward presence to deterrence, sea control, and humanitarian assistance. Aircraft carriers are powerful enablers, and for this reason, they are at the center of modern fleet structures. They are, however, also vulnerable to enemy attack. As such, all other surface and submarine assets operating within the fleet contribute to their defense.

Shore establishments support the functioning of the fleet. They perform key functions such as the management of human resources and personnel, and they hold responsibility for all institutions and facilities concerned with repair and maintenance, such as dockyards, education, meteorology and oceanography, legal matters, intelligence, naval and air bases, communication systems, and supplies. Among the different offices ashore, the office of the chief of naval operations covers the vital plans and policy functions of the navy. The head of the navy, the chief of naval operation, is usually a four-star admiral and is responsible to civilian authorities for the conduct of the service.

Navies and the Marine Corps

Navies have been involved in amphibious warfare since the days of the Greek siege of Troy. The landing of forces ashore in support of land operations to establish an initial foothold on a territory, or to insert small groups of forces to gather information and intelligence, remained firmly in the repertoire of naval organizations from ancient to contemporary times. Marine Corps units undergo very intense training to operate from the sea or land, and for this reason, they tend to possess a strong subculture and consider themselves as different from the rest of the navy. In contemporary navies, marine corps are assigned a type command under the fleet structure in a fashion not dissimilar to other branches of

the navy. In the case of the United States, the Marine Corps is a particularly large organization—roughly the same size of the entire British military—and therefore has a military structure that is independent from the U.S. Navy; though in terms of civilian administration, it is a part of the Department of the Navy.

Navies and Coast Guards

Coast guards are paramilitary maritime forces with law enforcement powers concerning a country's territorial waters and Exclusive Economic Zone. They can be an integral part of the navy or, as in the case of the United States, they can be an independent branch of the armed forces. Coast guards operate to guarantee safety, security, and stewardship at sea, and to prevent illegal acts to be carried out within a country's territorial waters. In peacetime, as a result of their law enforcement powers, coast guards operate under the authority of civilian authorities responsible for internal affairs. In countries where the coast guard is part of the navy, the latter oversees the administration and structural organization of the former, while coast guard operations remain under civilian authority. Responsibility for their operational activity is usually transferred to the navy during time of war. In the United States, peacetime activities of the coast guard were under the responsibility of the Department of Transportation from 1967 to 2002, when the Coast Guard was transferred to the newly established Department of Homeland Security.

Navies and Joint Command Functions

During the 20th century, and increasingly more in the post-Cold War era, the complex nature of military operations prompted the creation of unified or joint commands. These served to foster effectiveness and system integration among the different armed services at the operational and command levels. In terms of operations, in many military organizations, joint commands are created ad hoc, based on specific operational needs. In the case of the United States, the existence of broad and continuous missions across the globe entailed the creation of permanent unified commands. Some are regionally based, such as the Africa, Southern, European, and Pacific commands. Others are thematic, like the Special Operations and Strategic

commands. Joint commands of this kind can be described as “force users” in that they have operational control over naval (and other military) forces, with the navy in a role of “force provider,” retaining responsibility over organization, training, and equipment.

MILITARY SCIENCE

Military science is the study of military processes (decision making, etc.), institutions (units, armies, training organizations, etc.), and behavior (by individuals and units in war and peace), along with the study of war and warfare, and the theory and application of organized coercive force. It is a field of study, rooted in the humanities, that focuses on the study of the use of organized coercive force in history and in the international community through the theoretical study of military processes (decision making, etc.), institutions (units, armies, training organizations, etc.), war and warfare (meaning

armed conflict and the application of organized coercive force within armed conflict), and behavior (by individuals and units in war and peace); how the military aspect of national power relates to the other instruments of national power (diplomatic, informational, economic, and cultural); the theory and application of organized coercive force as an instrument of national power; and other issues specific to national armed forces.

Military science is broadly concerned with the use of organized coercive force in history and the international community and the study of warfare. The study of warfare is the study of human interaction, since wars are fought by armies composed of and led by human beings. As such, an accurate characterization of it should place it among the other humanities, all of which are connected by the study of some aspect of the human condition. The humanities reveal how people, living collectively, have tried to make moral, spiritual, and intellectual sense of a world in which irrationality, despair, loneliness, and death are as conspicuous as birth, friendship, hope, and reason; and military science is related to the humanities in many of these areas and instances. As a science, however, military science (like political science) is able to offer clues about the human condition but never a complete answer.

Military science often addresses related issues including international relations, foreign policy, diplomacy, military history, military theory, psychology, leadership, management, cultural studies (including the study of languages), and ethical studies. Work in military science influences and is influenced by the related work in the fields of history, philosophy, literature, conflict and peace studies, anthropology, political science, geography, and law. Work in military science is often associated with work in military history, military leadership, cultural studies, and other theoretical aspects of martial studies. While scholarly activity in military science is principally found in humanities departments and publications (in areas such as history, military history, cultural studies, political science, and other conflict studies), it is also found in social-scientific areas such as anthropology, sociology, and psychology. This entry addresses the theory, definition, scope of the field of study, etymology, contemporary components, and recent developments in and of the field of military science.

Definition

Military science is defined as a systemized body of knowledge regarding and relating to the theory, application, and employment of military units and weapons in land warfare (i.e., the conduct of war on land) and armed conflict encompassing issues related to the following areas: military leadership, military organization; military training and education; military history; military ethics; military doctrine; military tactics, operations, and strategy; military geography; and military technology and equipment. Within the Dewey Decimal System, military science is classified within the social sciences class and the public administration division, and it is a recognized section identified by the number 355.

As a Field of Study

Military science has always had a narrow, limited, and technical connotation and is considered to be a subset of the larger body of knowledge known as the *military art* (defined as the judgmental application of military science to the conditions at hand). Military science, like many other fields of study, does not possess a unified theory and is rather a diverse field of study encompassing many different approaches, methods, and academic perspectives. As in any academic discipline, military science scholars and practitioners frequently debate the scope and parameters of the field among themselves. However, some scholars from other fields have criticized the discipline as a whole for lacking legitimacy as a true academic endeavor. It has been popular to treat military science as not being worthy of being called a legitimate academic field of study. Army Major General Edward B. Atkeson (Ret.) has been an outspoken supporter of the military studies model of academic inquiry. Critics, however, see military science as simply a vocational body of knowledge akin to plumbing, as opposed to promoting its utility to the public by studying conflict, war, and the organized application of coercive force in a world that has been characterized far more by conflict than by peace.

Etymology

The term *military science* entered the American lexicon via the French military theorist Baron Antoine-Henri Jomini in the late 1840s and through the

writings of Henry Wager Halleck and Dennis Hart Mahan. The first recorded use of the term appeared in an obscure French work by Francois Robichon in 1742 as *science militaire*, followed by its appearance in a 1773 work by Jacques Antoine Hippolyte, Comte de Guibert, and a 1775 work by Guillaume LeBlond. Jomini, however, popularized the term in the introduction to his extremely influential 1838 work *Précis de l'Art de la Guerre*. Although not translated into English until 1854, Jomini's work was undoubtedly read in French by his two most ardent American admirers, Henry Wager Halleck and Dennis Hart Mahan, both of whom were comfortable reading French and who were famous Francophiles. In their own publications, which were largely reworkings of Jomini and which appeared within the next decade, including Halleck's 1846 *Elements of Military Art and Science* and Mahan's 1847 *Elementary Treatise on Advanced Guard, Outposts, and Detachment Service of Troops*, they used the term *military science* extensively, indicating the high level of Jomini's influence. Given the influence of Jomini's work on Halleck and Mahan and that Halleck's and Mahan's works were the most influential 19th-century military texts available in America, it is reasonable to conclude that the term *military science* entered the American lexicon in this manner.

The first official use of the term occurs in conjunction with the 1866 Army Bill, directing the assignment of selected officers to teach military science at civilian colleges and universities. After considering the 1866 Army Bill, army leaders determined that students at civilian colleges and universities would have approximately 2 hours each week to devote to military subjects. Given this relatively small amount of time, especially when compared with the amount of time spent on such topics at military schools, leaders determined that students would be able to learn only aspects of small unit military drill and the rudiments of small unit tactical employment. University administrators also expressed their desire that the students' military training consist primarily of physical activity, thus allowing it to satisfy physical education requirements (which is still the case on many campuses). These two concerns combined to create the general program of instruction for military training on civilian campuses. Since this training did not encompass the entire scope of the military art, the

term military science was used to refer to military training on civilian colleges and universities devoted primarily to drill and tactics.

By the time the ROTC program was established under the National Defense Act of 1916, the convention of referring to military training on civilian colleges and universities as military science had been established for 50 years, making it the logical choice for adoption by ROTC. American ROTC was based largely on an analogous British program, and the most influential post-World War I British military thinker, J. F. C. Fuller, also championed a similar term, adding to the logic of its adoption. The appellation of "science" also fit nicely with the Progressive Era's focus on progress and technology, further enhancing its appeal. Military science retained its attractiveness during the interwar period and especially during the Cold War, when the American academy again turned its attention to technical subjects, and the term helped provide ROTC departments with legitimacy within academe.

The restricted nature of the topics addressed by military science also supported its retention, especially during periods when ROTC was required to produce large numbers of officers. These instances occurred during the pre- and post-Vietnam War periods of the Cold War, especially during the periods 1950–1965 and 1980–1992, which coincide with the peak strengths of America's Cold War army.

Despite its utility, there have been repeated calls to expand the scope of military science. The first occurred during the World War II period, when it became evident that the training associated with military science was too narrow. The next came as a challenge from academics during the Vietnam era as a result of their assessment that military science consisted largely of vocational training rather than academic education. In response, military and academic educators expanded the breadth of the military science curriculum taught on university campuses far beyond the traditional elements of drill and tactics. Most recently, members of the military and civilians have issued a call to establish an academic field of study related to the military to better prepare soldiers for the challenges of the post-Cold War period and to help them make more substantive contributions to the development, implementation, and execution of military policy in the tremendously complex environment of the 21st century.

Components of Contemporary Military Science

In contemporary times, military science addresses the following areas: military leadership, military organization; military training and education; military history; military ethics; military doctrine; military tactics, operations, and strategy; military geography; and military technology and equipment.

Military Leadership

Military leadership addresses the theory of leadership, the leader-follower relationship, and ethics. Military leadership also encompasses learning about the dynamics and behaviors of effective leaders and followers, including how to work as a team, how to think critically, and how to solve problems. Education for leadership mandates development of critical and analytical skills, along with the development of basic leadership skills to allow for participation in meaningful opportunities to lead and thereby learn by doing. Education for leadership requires the enhancement of interpersonal skills as well. This component of military science provides both training and education to give practitioners a deeper knowledge of leadership to use as a foundation on which they can build their professional identities and competencies.

Military Organization

Organizational structure, behavior, and effectiveness constitute the main aspects of this area. Practitioners work to understand how military units can and should be formed, how they react in peace and conflict, and how best to arrange personnel and forces to achieve maximum effectiveness when employed. Of particular importance in this area are the concepts of hierarchy, span of control, organizational behavior and effectiveness, and teamwork.

Military Training and Education

Military science includes aspects of both military training and military education. Military training may be defined as the instruction of personnel to increase their capacity to perform specific military skills and associated individual and collective tasks. Training involves a student learning how to “do” a concrete task, and the product of such an endeavor is the relatively rapid acquisition of a particular *skill*

or *set of skills*. Military education, in contrast, may be defined as instruction designed to impart and increase a learner’s knowledge. Education involves learning how to “know” an abstract concept, which may take substantially longer than acquiring a skill, and the product of education is *knowledge*.

The scholars Joseph D. Noval and D. Bob Gowin have determined that effective learning requires an active interplay between training and education. They contend that the processes of training and education begin with an event and/or an object. But training focuses on gathering data and transforming them into comprehensible information to produce knowledge that can be applied, whereas education takes the knowledge and comprehension, analyzes it to develop new concepts, synthesizes it to develop new principles and conceptual systems, and evaluates it to develop new theories and perhaps new philosophies.

The distinction between training and education and the necessity for active interplay between the two approaches for effective learning to occur are critical to the effectiveness of any such system. While it is generally true that all members of a military organization receive some sort of training to acquire a modicum of military skills, military education is largely reserved for officers and senior noncommissioned officers, who tend to be longer serving than the average soldier and are thus able to spend the time necessary to acquire advanced military knowledge.

Military History

The study of military history provides practitioners with a basis of knowledge in the conduct of military operations and military leadership as well as serving as a “laboratory” to examine the other components of the military science discipline, including leadership; military tactics, operations, and strategy; and the impact of culture on war and warfare. While the study of military history is losing relevance in traditional academe, it is nonetheless essential for soldiers to study; so it makes sense to include it in the field of military science to help it survive and to focus on the military-utilitarian aspects of it as an academic discipline. Serving as it does as a laboratory of experience for soldiers, it is a critical component of the military science field of

study because it allows one to experience the chaos of battle vicariously and also aids in developing one's decision-making abilities.

Military Ethics

Ethics is a branch of philosophy covering the analysis and employment of concepts such as right, wrong, good, evil, and responsibility, and it consists of three primary subfields: (1) metaethics, (2) normative ethics, and (3) applied ethics. Military ethics is mostly associated with applied ethics, helping soldiers make moral and ethical decisions for themselves and their units in the chaos of battle and the stress of war. The study of applied ethics—the use of ethical values in actual situations—is thus essential to the consideration and application of coercive force within society, as well as for the development of future practitioners and leaders.

Military Doctrine

Military doctrine encompasses the analysis, development, dissemination, and application of doctrine, which may be defined as the approved and sanctioned method for the application of military science in a general and generic sense. Stated more simply, military doctrine describes how a military organization fights. Doctrine is not dogma, meaning that it is not intended to be applied blindly, but it does represent the most scientific aspect of military science in that it is based on hypotheses, developed, tested, and codified in a standardized method. The application of doctrine, however, is more associated with the practice of military leadership and represents the creative aspect of the military art. The design and development of doctrine is, however, the most intellectual aspect of military science.

Military Tactics, Operations, and Strategy

This aspect of the discipline, grounded in a solid understanding of military history, addresses the military and the use of organized coercive force in the international community and encompasses learning about the role of armed force in society and the international community, the theories of application of force, the components of military force, and the methods and techniques for applying military force across the entire spectrum of conflict. This aspect of

the discipline also relates to international relations, foreign policy, diplomacy, conflict and peace studies, and ethics.

Military Geography

Linked closely with military tactics, operations, and strategy, and military doctrine, this aspect of military science involves the study of geography from a military perspective in terms of the deployment, employment, and sustainment of military forces, units, and equipment. It involves learning to analyze and assess areas and terrain from the physical, cultural, and political-military perspectives in order to understand specific time-space relationships and to determine the best method of application of military doctrine and the selection of military tactics, the design of military operations, and the determination of military strategy. A keen understanding of military geography is essential to maximize the three key elements of land warfare: (1) firepower, (2) maneuver, and (3) sustainment.

Military Technology and Equipment

This aspect involves the study and employment of available technology and equipment within the dictates of military organization, military doctrine, and military geography. Less concerned with the actual design of weapons and other implements, this area encompasses expertise in the employment capabilities and use of available technology and equipment as force multipliers and to maximize the application of coercive force in given situations. It also involves developing and sustaining partnerships with civilian and military contractors to ensure technology and equipment function as required and are acquired in the necessary quantities. Logistical and sustainment operations are also included in this aspect of the field of study.

Recent Developments

Two somewhat recent developments have or have the potential to have a substantial impact on military science as a field of study: the increased importance of cultural studies to the conduct of warfare and the development and adoption of the concept of officership by the U.S. military in general and especially the U.S. Army.

Cultural Studies

Cultural studies, which include the study of languages, is rapidly becoming another fundamental component of military science. When added, this aspect of the discipline, grounded in a solid understanding of history, geography, culture, and language of areas around the world, will address the impact and applicability of the military and the use of force in the international community. It will encompass learning about other cultures and regions in the international community to better prepare individuals for serving in and making decisions regarding the use of force in such areas. In particular, the impact of culture on war and the conduct of warfare has become especially relevant in the contemporary operating environment, and the discipline is making a deliberate attempt to embrace and incorporate this aspect into its field of study. With its addition, cultural studies will allow the field of study to better address elements of international relations, foreign policy, diplomacy, conflict and peace studies, regional and cultural studies, and the study of languages within its curricula and pedagogies.

Officership

The U.S. Army has recently developed and embraced the concept of officership to describe and distinguish the actions and activities of its officers. Defined as the practice of being a commissioned officer imbued with a unique professional identity, the concept addresses four distinct domains, including Military-Technical (which is largely military science); Human Development (which includes leadership, human motivation, and physical training, all of which, except physical training, are addressed primarily in the humanities and/or social sciences); Moral-Ethical (which includes ethics, values, officership, just war, and law of war/armed conflict, all of which are addressed primarily in the humanities and/or social sciences); and Political-Cultural (which includes military history and civil-military relations, both of which are addressed primarily in the humanities and/or social sciences). Officer responsibilities include the ability to function effectively in all of these domains in the four accompanying roles of Warrior (Military-Technical), Member of the Military Profession (Human Development), Leader of Character (Moral-Ethical), and Servant of the Nation (Political-Cultural).

These new concepts suggest the need for an expanded conception of the military science field of study, based solidly in the humanities and social sciences and perhaps dubbed *military studies*, which would be more in line with current academic practice and which would be a much more accurate characterization of this immensely interesting and far-ranging field of inquiry.

MINES, LAND

A land mine is broadly defined as any explosive device or munition that is placed under, on, or near the ground or other surface area and that is designed to be detonated or exploded by the presence, proximity, or contact of a person, vehicle, or animal. This entry traces the development of land mines and discusses types of land mines and their uses during the two World Wars and up to the present, including “terror mining.”

The Origins of Land Mines

The linear ancestor of land mines is regarded as the caltrops—a metal device with four sharp pronged points intended to pierce a horse’s hoof or a soldier’s foot, first employed during the time of Alexander the Great. Early gunpowder mines were used by the Chinese against the Mongols in the 1200s. By the 1600s, European military engineers had invented the fougasse—a gunpowder-filled buried device that, when ignited, blasted scrap into oncoming enemy sappers (combat engineers)—for defensive use in siege warfare. Flame fougasses occasionally are still used as field-expedient defensive weapons in modern warfare and can be devised out of 55-gallon steel drums filled with napalm or similar flammable substances.

Although the Russians used a few extemporaneous land mines and fougasses in the Crimean War of 1853–1855, the modern land mine’s first historically significant use is usually dated to the American Civil War. Confederate forces experimented with land mines during the 1862 Peninsula Campaign, in the 1863 defense of Fort Wagner, and at Forts McAllister and Fisher near the war’s end. Several of these types were purpose-made, but most were converted artillery shells. The psychological power of this weapon was immediately apparent. One soldier

who fought at Fort Wagner wrote that land mines “attack both matter and mind.” Major General George McClellan, commanding the Union’s Army of the Potomac, asserted that the Confederates’ use of land mines was “the most murderous and barbarous thing I ever heard of” (Perry, 1965, p. 22).

The Rise of Antipersonnel and Antitank Mines

While some purpose-made land mines were used in the First World War, most were improvised from artillery shells. More advanced land mine technology flourished in the 1930s in two overall types: (1) antipersonnel (AP) and (2) antitank (AT).

Generally pressure-activated, AT mines are intended to cripple a vehicle’s mobility (an “M-kill”) by blowing off a track or wheels or, for smaller vehicles, to cause catastrophic damage (a “K-kill”) by the blast effect. A representative precursor of modern AT mines is the German *Teller* mine. This 13-pound cylindrical mine was activated by the pressure of a 125-kilogram weight and had fittings for antihandling igniters that were used to detonate the mine if someone attempted to remove or disarm it. Later types of AT mines, known as full-width-attack mines, are detonated by a tilt rod that, when bent down by movement of a vehicle passing overhead from any direction, triggers the fuse.

AP mines were originally used largely for defense of AT minefields but found wider application. Types ranged from grenade-like, fragmenting models like the Soviet POMZ-2, still found in many arsenals, to the German S-mine. Activated by pressure on prongs emanating from its fuse or via tripwire, a small primary explosion launched the S-mine to chest height; then, a larger explosion detonated the mine, which was filled with ball bearings.

As electromagnetic mine detectors became prevalent, the world’s combatants invented nonmetallic AT and AP mines. The German *Schu* mine was a wooden-boxed mine, the only metal components of which were in its fuse assembly. It was nevertheless powerful enough to destroy a soldier’s foot or leg.

During World War II, both Axis and Allied forces frequently sowed mines as a routine, integral part of defensive operations. To prepare for the Germans’ Kursk offensive of mid-1943, the Soviets planted an average of 2,400 AT and 2,700 AP mines per mile to channelize German movements into well-prepared defensive zones. To strengthen the Atlantic

Wall's fortifications, German troops had emplaced 4,193,167 mines by May 1944. Germany's usage of AP mines to thwart the Americans' assault crossing of the Rapido River in January 1944 is considered a classic example of the defensive use of land mines.

Several nations have devised poison gas-filled mines, including the United Kingdom, the United States, and the Soviet Union, but none has been used in combat. The United States and the Soviet Union also developed nuclear "backpack" mines called atomic demolition munitions, or ADMs, during the Cold War period.

Modern Land Mines, the Cold War, and Arms Proliferation

Following the advent of land mines, armies quickly learned to prepare and maintain accurate minefield markers and maps. This became regarded as an established legal norm and practice under the laws of land warfare and was reflected in U.S. military doctrine and field manuals.

The United States produced its own versions of the *Teller* mine and the S-mine, the M14 and M16; a small AP mine, the M14 "toe-popper"; and the M18 Claymore directional mine, which can either be command detonated by a user for an ambush effect by pressing a hand-operated detonator ("clacker") or by tripwire. When detonated, the Claymore spews hundreds of small steel pellets forward like a giant shotgun blast.

To help neutralize any Warsaw Pact invasion of Western Europe during the Cold War, U.S. forces pioneered the development of scatterable mines and area denial artillery munitions. Air-delivered versions of these weapons were first used extensively in the Vietnam War. To provide field commanders with greater tactical advantages—and partly to counteract increasing legal concerns, discussed in more detail below—the United States and other nations have developed various models of self-destructing mines. These include the U.S. Air Force's GATOR air-scatterable system, which dispenses a mix of BLU-91/B AT and BLU-92/B AP mines. Each BLU-91/B has a microelectronic fuse that can detect and differentiate between different types of vehicular targets and then explodes the mine when the vehicle is most vulnerable. Both the BLU-91/B and the BLU-92/B have programmable self-destruct switches that are activated before the dispensing aircraft takes off.

The U.S. Army's M139 VOLCANO dispenses 960 self-destructing mines in a pattern 1,100 meters long by 120 meters wide. Many self-destructing mines' self-destruct systems, however, are not foolproof and do not always work properly.

During the 1970s, arms manufacturers marketed inexpensive, plastic AP mines with very low metal content, such as the mass-produced Valmara VS-69 and VS-50 and Soviet-designed PMN "Black Widow." By the 1990s, 5 to 10 million mines were produced annually. As these weapons were increasingly acquired by military and guerrilla forces with little training in their traditional usage, Western norms of mapping and marking minefields were ignored in many cases. What had hitherto been a largely defensive weapon of battlefield denial now became an offensive weapon that could be used to terrorize civilian populations. Even traditional armies expanded their use of land mines outside traditional battlefields during this period. The Soviets dispersed at least 10 million mines—including the air-dropped PFM-1 "butterfly" or "green parrot," which resembled a child's plastic toy—across Afghanistan. Soviet mines victimized perhaps as many as 1 million Afghans during the 1979–1989 war.

"Terror Mining" and the Laws of Land Warfare

In the late Cold War era, land mines' usage spread beyond traditional military forces to guerrilla and insurgency forces. Land mines were sown by both sides during the Angolan Civil War to sever farmers' access to arable land and strangle transportation links. Saddam Hussein's Iraqi troops extensively and randomly mined Kurdish territories without mapping the minefields. More than 4 million mines were planted across Cambodia—approximately one mine for every two Cambodians. The traumatic wounds inflicted by "terror mining" against civilian populations has left many survivors destitute and exceeds the capabilities of many developing nations' health care and social welfare systems to care adequately for victims and their families.

At least 56 nations have now been heavily mined, including Colombia, El Salvador, Nicaragua, Libya, Egypt, Chechnya, the Falkland Islands, Kuwait, Somalia, Serbia, Croatia, Bosnia and Herzegovina, Georgia, Iraq, Iran, Pakistan, India, Sri Lanka, Laos, and Vietnam. The demilitarized zone between North

and South Korea remains extensively mined since the 1953 cease-fire; U.S. forces continue to stockpile approximately 1.1 million M14 and M16 AP mines for potential use on that peninsula.

Land mine warfare has never been wholly banned under international law, but its legality has been circumscribed by several treaties. Protocol II to the Conventional Weapons Convention (1980s) made illegal the indiscriminate use of any weapon, the use of weapons that cause “unnecessary suffering,” or intentionally using any weapon against civilians. Due to increasingly indiscriminate use of AP mines against civilians and the long-term consequences for many nations, international efforts were pursued to tighten the Conventional Weapons Convention’s restrictions on AP land mine usage. These resulted in amendments in 1996 to Protocol II, and in 1997s Ottawa Treaty to prohibit the usage, sale, and stockpiling of AP mines. Based on concerns that adherence to such a treaty would weaken its defense of South Korea, the U.S. government has refused to ratify the Ottawa Treaty, although it adheres to the 1996 Protocol II amendments.

Improvised Explosive Devices and the Future of Land Mine Warfare

The high civilian casualties caused by land mines since the 1980s and the large number of American victims of improvised explosive device (IED) attacks in Iraq and Afghanistan seem at odds with the numbers of casualties inflicted by these weapons on more traditional battlefields. Two Canadian researchers have concluded that the number of casualties actually produced by mines typically averaged only between 2% and 6% of all battlefield casualties, but this study recognized that casualties alone were not always crucial in determining the impact of AP mines in combat environments. Their psychological potency in sowing fear and in slowing the tempo of offensive operations remains difficult to challenge. The costs of removing land mines are also substantial: One UN report estimates the cost of training for only one worker skilled in mine removal as between \$300 and \$1,000 per mine. Other estimates of worldwide costs of land mine clearance range from \$200 billion to \$300 billion over 25 years.

Although not strictly land mines, IEDs have been identified by U.S. Army leaders as the single greatest source of U.S. casualties in Iraq and Afghanistan.

IEDs reportedly caused 60% of all U.S. combat casualties in Iraq and 25% of the combat deaths there and 50% of U.S. casualties in Afghanistan.

While mine location and disposal technology has advanced beyond probing with rods and bayonets and sweeping with electronic mine detectors, land mines and their ilk still have enormous capacity to impede operations and inflict casualties. Active countermeasures like armored combat earthmovers and mine plows, mine flail-equipped vehicles, and explosive-filled “snakes” work better for large minefields but less well for randomly sowed mines and

A group of U.S. Air Force Explosive Ordnance Disposal personnel from the 506th Expeditionary Civil Engineer Squadron unload a truck of live munitions, including SB-81 land mines, as they prepare to destroy them at Kirkuk Air Base, Iraq, on October 28, 2004.

carefully emplaced IEDs. Passive defensive measures, like “up-armored” HMMWVs (High Mobility Multipurpose Wheeled Vehicles) and mine-resistant, ambush-protected vehicles, have limitations as well. Continued usage of land mines and IEDs in conflicts like Iraq and Afghanistan ensures that such weapons still have a significant role to play in 21st-century combat and peacekeeping operations.

MINES, NAVAL

The United States and other nations have used naval mines offensively since the invention of the “Bushnell Keg” during the American Revolution, but their largest impact has been as the weapon of choice for many smaller nations and forces, even those without an established navy. The world’s premier naval forces have therefore been forced to focus on mine countermeasures (MCM) as a basic tenet of sea control and power projection. This entry provides a brief history of the use of naval mines and provides a basic primer on general types and classifications of mines as well as specific definitions associated with mine warfare.

History and Background

The Bushnell Keg was invented by David Bushnell during the American Revolution. It was a watertight

keg packed with gunpowder, with a floating flint detonator designed to drift down the Delaware River and explode against the hull of a British ship. What we now would term *drifting contact mines* were taken as more of a nuisance than threat by the British navy. That perception would last for over a half century.

By 1810, Robert Fulton had built a bottom-moored contact mine from a design that survived with surprisingly few significant changes through World War II, but the sea powers of the day showed little interest in his research. Early in the American Civil War, however, the Confederates formalized the mine warfare paradigm that garnered attention worldwide and survives today. They invested heavily in mine research like Fulton's to develop and deploy a cheap, effective alternative to building and maintaining a large navy and utilized several different types of mines very successfully throughout the war.

On the Union side, Admiral David Farragut's famous "damn the torpedoes [mines] Captain Drayton go ahead" clearly echoed the disdain most naval officers held for mine warfare. But even Farragut had to admit that it was an advantage one could not concede exclusively to the enemy. During the era of the two World Wars, the United States established itself as the dominant naval power in the world but continued to demonstrate Farragut's disdain for mine warfare. Other, smaller nations would pay closer attention to the mine warfare lessons of the American Civil War.

During the Korean War, just 1 month after the stunningly successful amphibious landing at Inchon in September 1950, the U.S. Navy prepared to conduct another amphibious landing at Wonsan near the southern tip of the peninsula to relieve and reinforce Allied forces. In a somewhat embarrassing turn of events, the South Korean army captured the city before the amphibious force, delayed by mine-removal operations, could make it ashore. To paraphrase the commander, Amphibious Task Force Rear Admiral Allan E. Smith, control of the sea had been lost to a nation without a navy, using antiquated weapons and Christ-era vessels.

Forty years later, during the Persian Gulf War, the mine threat again prevented a planned U.S. amphibious landing in Kuwait. In March 2003, the opening of the port of Umm Qasr was delayed for more than 36 hours for the same reason during Operation

Iraqi Freedom. In both cases, just as at Wonsan, the world's premier naval forces were denied command of the sea by a nation without a significant navy, utilizing relatively cheap naval mines. Modern research has produced continually more sophisticated sea mines, but the plentiful supply of simple, cheap World War II-era mines remains the major concern of any nation wishing to preserve freedom of, or control of, the sea.

Naval Mines: Terms, Types, and Classification

Naval mines are classified by their position in the water, method of delivery, and method of actuation. These classifications are used in combination to provide a more specific description of the mine itself, the threat, and the countermeasures required to neutralize it.

Position in the Water

Bottom mines are used in waters less than 200 feet deep. Beyond that depth, they pose little threat to shock-hardened vessels. As the name implies, they lay on the bottom of the ocean (lake, river, etc.) and are normally influence activated. (See "Method of Actuation" below.)

Moored mines are designed to be effective against submarines and surface ships in deeper water but may be used in shallow water also. The explosive charge and firing mechanism are housed in a positive-buoyancy case attached to a cable anchored to the sea bottom. Moored mines may be influence, contact, or control activated.

Drifting mines float freely on or near the surface due to positive or nearly neutral buoyancy. Although their use was severely limited by the Hague Convention of 1907, large stockpiles are suspected to still exist either for sale by illicit weapons dealers or in the possession of rogue or Third World nations such as North Korea or Libya. Simple, cheap, and easily deployed, these mines remain a formidable deterrent against even the most capable naval forces of the modern world.

Method of Delivery

Aircraft-delivered mines are dropped from the aircraft in the manner of bombs and may require some aerodynamic modification to standard casings. This

method of delivery offers the advantage of speed. Many mines can be planted in a short period of time, which may be particularly desirable during offensive mining operations.

Submarine-delivered mines are specially configured to be launched from torpedo tubes and offer the best method for laying minefields covertly.

Surface-delivered mines may be delivered by any ship or boat.

Method of Actuation

Influence mines are actuated by the magnetic, acoustic, seismic, or pressure signatures of ships or countermeasure devices. The detector may have one or a combination of magnetic search coils, magnetometers, hydrophones, or pressure devices.

Contact mines are the oldest, least expensive, and most common type of naval mine. Physical contact between the mine and the target is required to detonate the mine, which in turn requires very little sophistication or expense.

Controlled mines receive firing signals from external control centers. They require monitoring to be effective and are traditionally associated with defensive minefields. Controlled mines have no destructive capability until affirmatively activated.

Armed mines either are emplaced with all safety devices withdrawn or are armed following emplacement so as to detonate when preset parameters (if any) are satisfied. This is a specific distinction made under international law to group all noncontrolled mines into one definitive category.

Mine Warfare

Mine warfare is the strategic, operational, and tactical use of sea mines and their countermeasures encompassing the total capability of laying, employing, locating, and neutralizing mines. As with most other warfare specialties, mine warfare includes both the protection and use of one's own assets and capabilities and the destruction or defeat of the enemy's.

Mining is the emplacement of mines and can be offensive or defensive in nature.

Offensive mining is typically associated with attacking enemy ships, supplies, and assets or planting mines in enemy waters to prevent the free movement of enemy vessels.

Defensive mining is used to guard selected waters from enemy intrusion and is historically the most prevalent use of mines (e.g., Umm Qasr, Kuwait, Wonsan, Mobile Bay). Mines used for defensive purposes can be of any type, classification, or vintage, and inexpensive simple contact mines are often as effective as more complicated expensive ones because it is often the threat of a minefield that stops the attacking force rather than actual damage inflicted. Defensive minefields can be specifically designed to cover vast sea areas, selected approach lanes, or choke points or employed to protect viable enemy beach landing sites. They can be placed in deep or shallow water and can be designed to harass, inflict maximum damage, restrict maneuverability, or channel enemy ships into a range of friendly shore batteries.

Mine countermeasures may be either offensive or defensive in nature and include all methods, procedures, and practices to prevent or reduce friendly force damage or danger caused by naval mines.

Offensive MCM, sometimes referred to as antimining operations, includes those actions taken by friendly forces to destroy enemy mines and/or mining capability before the mines are deployed. Offensive MCM is the most proven and effective method of defeating enemy naval mines simply because they are much more easily detected and destroyed before they get in the water.

Passive MCM includes those actions, operations, and practices taken after enemy mine deployment to protect friendly assets and personnel, and it may be further divided into active and passive measures. Passive defensive MCM measures include surveillance, avoidance, deperming (demagnetizing a ship's hull using electrical current), degaussing (reducing a ship's magnetic signature), noise reduction, and other forms of ship protection such as installing special mechanical devices. Active defensive MCM involves tactical-level actions designed to locate, neutralize, and/or deceive mines into detonating on false targets to include mine hunting, mechanical or influence minesweeping, mine disposal, and countermining.

Conclusion

Although mine research has continued to produce more sophisticated, high-tech weapons, the use of mines either offensively or defensively by modern naval powers is rare. The United Nations, international law, and various multinational treaties have set severe limits on the use of both land and sea mines, and rightfully so. Unfortunately, those organizations are usually ill equipped to ensure compliance from even the member nations, let alone the rogue and Third World countries that view mines as their best, most cost-effective deterrent against sea attack.

Modern naval powers such as the United States, France, and England therefore tend to focus on the MCM aspect of mine warfare, particularly mine-sweeping capability. But as always, limited budgets often require prioritization, and MCM is seldom at the top of the list. As a result, U.S. Navy minesweeping operations—after the war—in conjunction with other nations' military and civilian assets, are fairly good. Given enough time and a benign operating environment, most sea mines can be policed up. In a hostile environment, however, "in-stream" during an amphibious assault, minesweeping capability remains severely limited.

MISSILES, AIR-TO-AIR

An air-to-air missile (AAM) is a guided missile powered by one or more rocket motors and with some type of guidance system to detect and/or direct it to an opponent's aircraft. This entry examines the development of AAMs and describes their features.

General Description

AAMs usually have long, thin cylinders that contain the radar system, radar homer, or infrared (IR) detector at the front, followed by the avionics that control the missile. Typically, the center of the missile contains the warhead, usually several kilograms of high explosive surrounded by metal that fragments on detonation. The missile's fuel tanks and rocket motor are in the missile's rear. Most AAMs use solid-fuel rockets, but some longer range missiles are liquid fueled. The AAM usually has dorsal and/or tailfins to provide flight stability. Most aircraft carry their AAMs externally on wing contact points, launch rails, and/or pylons.

After a pilot detects an enemy aircraft, the pilot launches the AAM, which uses radar or IR, sometimes laser, guidance, or optical tracking, to guide it to the target. If the AAM is radar or laser guided, the launch aircraft "paints" the enemy aircraft with a radar or laser beam, and the missile's seeker detects the reflected beam and then homes in on the enemy aircraft. If the missile is IR guided, its IR seeker detects the enemy aircraft by its heat "signature," usually the heat emitted from the aircraft's jet engine(s), and homes in on the heat source. The missile destroys or damages the target aircraft with fragments of the warhead detonated by a proximity fuze or by a direct hit from an impact fuze.

A missile's effective range, the "no-escape zone" in which the target cannot evade the missile once launched, depends on a variety of factors, such as altitude, speed, position, and direction of the target aircraft. Often, the stated range of an AAM is only accurate for a head-on, nonevading target at high altitude.

Origins

Today's AAMs developed from World War I unguided air-to-air rockets. The French air service lieutenant Yves Le Prieur invented an incendiary air-to-air rocket, essentially a cardboard tube filled with 200 grams of black powder with a wooden conical head, for use against observation balloons and airships. The rockets had an effective range of about 115 meters (383 feet). The pilot fired the rockets, attached to the struts supporting the biplane's wings, simultaneously with an electric cockpit switch. However, the pilot had to continuously keep the target in his

gun-sight and dive at his target until the last rocket discharged since the ignition and discharge of each rocket did not occur immediately and the delay varied slightly from one rocket to another. The rockets were first used in the 1916 Battle of Verdun.

During World War II, Germany, faced with growing Allied air superiority, put considerable effort into missile development. The Luftwaffe developed the R4M rocket, a simple steel tube with flip-out fins on the tail for flight stability. Luftwaffe pilots usually fired the R4Ms in four salvos of six missiles from a range of 600 meters (1,995 feet). The Germans had two warheads for the R4M, one for use against aircraft and a larger shaped charge for use against tanks. Generally, only the Messerschmitt Me 262 and the ground attack version of the Focke Wulf Fw 190 utilized the R4M.

The Luftwaffe also developed the Ruhrstahl X-4, a wire-guided AAM. The pilot corrected the missile's direction of flight and maintained its stability by operating control surfaces on the tail through two wires attached to the missile body. Developmental work on the X-4 began in June 1943. Because of the problems in simultaneously guiding both the missile and the launch aircraft, only multiseat aircraft would have used the X-4. It did not become operational before the war ended, but it did become the basis for the postwar development of experimental, ground-launched antitank missiles.

After the war, several air forces began developing AAMs. In 1955, the Royal Air Force introduced the radar-guided Fairey Fireflash. This missile had a pair of solid rocket boosters on the forward fuselage that provided initial forward motion and then were jettisoned 1.5 seconds after launch, leaving the missile to coast into its target. However, because of poor operational performance, the Royal Air Force replaced the Fireflash with the de Havilland Firestreak IR missile in August 1958.

Current Air-to-Air Missiles

In 1956, the U.S. Air Force introduced the radar-guided (later IR) AIM-4 Falcon, and the U.S. Navy deployed the medium-range semiactive radar-guided AIM-7 Sparrow. The air force later adopted the navy's Sparrow AAM. In 1991, the U.S. Air Force deployed the AIM-120 advanced medium-range air-to-air missile to succeed the Sparrow, and it entered service with the U.S. Navy 2 years later. This is a

beyond-visual-range, all-weather, day-and-night, fire-and-forget missile with active radar guidance. This feature allows the missile, once it "locks" on to an enemy aircraft, to follow its evasive movements without additional inputs by the launching aircraft.

The U.S. Air Force also deployed the short-range IR AIM-9 Sidewinder in 1956. Since then, the AIM-9 in its several variants has become the most widely used missile in the West with more than 110,000 missiles produced for the United States and 27 other nations. The latest IR AAMs can lock on to a target from various angles, not just from behind, where the heat signature from the engines is strongest.

Because of advances in AAM technology, air-to-air combat today consists almost entirely of AAM firing. By the early 1960s, machine guns had disappeared from American fighters. During the Vietnam War, the United States reintroduced cannons and traditional dogfighting tactics. However, AAMs remain the primary weapon for air-to-air combat.

Presently, the air forces of 15 countries utilize domestically developed AAMs, most of which utilize active radar or IR guidance and export most of these designs to other countries. Over time, some countries have modified and/or improved on the original imported design.

MISSILES, CONVENTIONAL

While expensive and technical in nature, the missile is an essential part of today's combat and superiority in air, ground, and sea. The concept of the missile alone has spurred advances in aviation, avionics,

and communications while forcing militaries to consider the possibility (and strategic value) of lightning fast attacks from airborne opponents or long-range devastation from far away enemies. This entry discusses the history, guidance systems, and types of missiles and examines their role in recent conflicts.

What Is a Missile?

Missiles can only be classified as such if they meet two criteria: First, they must have some kind of a propulsion system, whether it be a rocket motor, a jet engine, a ram jet, or some other source of thrust besides gravity; and second, they must have a guidance system, which could include the combination of fins, flaps, ailerons, laser guidance systems, infrared sensor guidance, optical lens guidance, or Global Positioning System (GPS) signal guidance. The nature of missiles also considers the launch platform and payloads, also known as warheads. Launch platform refers to either a mobile (e.g., an aircraft or ship) or fixed (e.g., a surface-to-air missile, or SAM, site or silo) platform from which the missile successfully launches against a target. Payloads could include conventional explosives, nuclear materials, biological agents, or chemical agents. The target of a missile could be any threat that must be eliminated, including enemy aircraft, enemy tanks, or other armored vehicles; command centers; communication towers; or, in the case of very large missiles, even entire military bases or cities. Thus, the capability and destructive power of missiles has redefined warfare, especially in the modern age. This redefinition has included the fear of missile attacks and spurred on developments into countermissile technology, which consists of missiles to target other missiles in their path to their target (e.g., the Patriot missile system) to experimental, high-powered microwave emitters such as the CHAMP project currently under way by the U.S. Air Force.

The History of Missiles

The desire of striking an opponent from a safe distance while producing the force to eliminate the threat has been around since the dawn of man. The bow and arrow could arguably be the first kind of “missile” as it has propulsion from a bow string, a payload in the form of an arrowhead, and the guidance system of the skilled archer. The ancient Chinese originated the precursor to modern missiles

following their discovery of gunpowder. Using nothing more than overpowered fireworks, Chinese guardsmen implemented a rocket filled with powder against Mongol invaders. Nearly 1,000 years later, modern missile technology would truly come into existence with World War II. Adolf Hitler and his Nazi party had the ambition of conquering the British Isles in an attempt to guarantee a hold over Europe. To aid in his attack, Hitler commissioned the creation of the devastating V-2 rocket: the world’s first guided missile system. While Nazi Germany did not win the war, the V-2 left an enormous impression on the world that would never be forgotten. From that time on, missile technology became a major arms race. The United States and the USSR most notably began ambitious projects to create a stronger and faster missile system that would eventually lead to the nuclear missile system that highlighted the Cold War. In the post-Cold War era that we live in now, missile technology has fused with computer and space technologies to create fascinating new methods of striking opponents from a distance (or continent) away.

The Mind of a Weapon: Guidance Systems

Simply put, a guidance system is any device—often a combination of devices—that aids the missile in reaching the target. With the advent of computers, satellites, and radio communication, guidance has become more than just fins and special shapes: It has become a controlling device to ensure near-exact precision for hitting targets. Several techniques of modern missile guidance exist, such as command and homing guidance. Command guidance uses a fiber optic wire that connects a missile to its launcher; a computer then operates the missile and guides it toward its target. Homing guidance breaks down into three types: (1) active, (2) semiactive, and (3) passive. All three function by using radar to “paint” a target and lead the missile toward the target. Active homing missiles have a radar within their cone that paints the target, while semiactive homing missiles rely on a ground radar to paint the target for them; with regard to passive homing missiles, the missile does not use a radar beam but rather tracks the electromagnetic emissions put out by the target (e.g., an aircraft’s engines or radio communications). While command and homing guidance are intended for air-to-ground or ground-to-ground

missiles, there are navigational guidance systems that rely on GPS satellites and terrain matching intended for powerful ground-to-ground missiles. GPS navigation requires at least three to four GPS satellites to send positions to a missile's guidance computer; the missile then knows, based on this triangulation, where it is located and where the target can be found. Terrain matching involves the computer scanning and analyzing the terrain around it until it finds a match on the terrain it is looking for. Guidance is an essential part of a missile's design and has enabled almost true accuracy in today's missile systems.

Types of Missiles

Considering the wide uses of missiles in a combat situation, many different forms of missiles have come into existence. The many forms of conventional missiles that exist can be broken down into two families: (1) ground-to-ground missiles and (2) air-to-ground missiles. Ground-to-ground missiles include everything from hand-fired antitank missiles to the infamous nuclear intercontinental ballistic missile. Air-to-ground missiles consist of powerful cruise missiles launched from an aircraft to antiradiation missiles such as those used by the notorious Wild Weasel squadron of the U.S. Air Force against SAM sites during the Vietnam War.

The Ground-to-Ground Missile

Ground-to-ground missiles (GTGM; also known as surface-to-surface or SSM) are simply missiles that are launched from a platform on the ground and hit a target on the ground. They become airborne right after launch and remain propelled for a set amount of time depending on the type of missile. To reach the target successfully, several factors have to be considered. First, how much fuel is needed to propel the missile without making it too heavy to fly correctly? Second, how powerful a payload (the size of the explosive on board) will be needed to destroy the target without hurting innocent civilians or civilian structures like homes or schools? And third, what kind of angle should the missile be launched at so the trajectory (or the path that the missile takes from its liftoff to its impact—it appears as an arch or parabola) puts it on course? Once these questions are answered (and often thoroughly tested in the development phase of a missile), the missile can

make its way successfully to a target with the right explosive capability.

There are four basic types of SSMs: (1) ballistic missiles, (2) cruise missiles, (3) antitank guided missiles, and (4) antiship missiles. Ballistic missiles have a high trajectory and their motor burns out throughout the flight. Types of ballistic missiles include tactical (150–300 kilometers range), battlefield range (less than 100 kilometers), theater (300–3,500 kilometers), short-range (1,000 kilometers or less, often with the capability of carrying nuclear munitions), medium-range (1,000–3,500 kilometers), intermediate-range or long-range (3,500–5,500 kilometers), and intercontinental (5,500 kilometers or more; called a submarine-launched ballistic missile if launched from a submarine). Ballistic missiles are often launched from fixed installations (e.g., silos) on the ground or a mobile vehicle launcher; however, some can be launched from ships or submarines (like the U.S. Navy's Trident I C-4 or Trident II D-5).

Cruise missiles have a low trajectory, their motor burns throughout the flight, and their range greatly varies. Three speeds of cruise missiles exist that effect their abilities: (1) subsonic (below the speed of sound, which is under Mach 1), (2) supersonic (above the speed of sound, Mach 1.2–5.0), and (3) hypersonic (far above the speed of sound, Mach 5.0–10.0). For subsonic cruise missiles, short-range varieties can reach targets up to 300 kilometers away, medium-range can travel less than 1,000 kilometers, and long-range can hit targets between 1,000 and 2,500 kilometers. This does not include the ultra long-range Russian Kh-55 with a range of 3,000 kilometers while still being subsonic. Supersonic cruise missiles usually travel at ranges between 100 and 500 kilometers but make up for a lack of range with their incredible speed. Hypersonic missiles are still in the developmental stages but are certainly the way of the future. The joint Indian-Russian built missile called the BrahMos-2 is a precursor of this type, with a 290-kilometer range. While the missile is still currently in development, it has achieved hypersonic flight successfully by reaching Mach 7. No matter what speed or range, cruise missiles can be launched from fixed ground installations, vehicles, aircraft, or ships. Also, cruise missiles can be launched from submarines instead, providing enormous tactical capability.

Antitank missiles have a low trajectory, their motor may or may not burn throughout the flight, and they only have a range of 5 kilometers. As the name implies, these short-range missiles are intended for destroying armor units such as tanks and mechanized infantry. Antitank missiles include launchers mounted on armored vehicles, tanks, or from defensive fighting positions to handheld tube launch systems that require no setup prior to use.

Finally, antiship missiles have a low trajectory, their motor burns throughout their cruise, and they have a wide range from as low as 25 kilometers to as high as 3,000 kilometers. Depending on the type of missile, some missiles pop up to hit their target, others either skim just over the water or form a trajectory through the sky to reach their target. Also, many antiship missiles are not just intended to attack ships but can also be used to attack land targets as well, such as the U.S. BGM-109 Tomahawk cruise missile or the Turkish SOM (Stand-off Mühimmat Seyir Füzes) cruise missile. Launch platforms for these missiles could be aircraft or vehicle mounted, trailer mounted, based out of a fixed ground installation, or ship/submarine based.

The Air-to-Ground Missile

Air-to-ground missiles (AGM or ATGM; also known as air-to-surface or ASM) encompass missiles launched from an aircraft to hit a target on the ground. Since the aircraft is already airborne, missiles launch either from under aircraft wings, from missile launch devices affixed to the side of aircraft, or from under the aircraft body itself and take flight toward the target. Aircraft could include any military aircraft such as jets, propeller-driven aircraft, or helicopters.

AGMs include antitank guided missiles, cruise missiles, antiship missiles, and antiradiation missiles. Antitank guided missiles are intended to strike tank units and are usually launched by attack helicopters within 5 kilometers of their target. Cruise missiles and antiship missiles, no different from their SSM counterparts, use an aircraft as a launch platform. Finally, the antiradiation missile is specially designed to destroy energy radiation signatures from radar towers or SAM sites.

While not an air-to-ground missile, but rather a ground-to-air missile type, the SAM is worth understanding as it functions much like an air-to-ground

missile. The SAM site is a fixed or mobile ground turret with missile chambers that point up toward the sky. A radar device sends out beams across the sky that search for potential enemy aircraft, and once one is found, it locks onto the target. The missile fires once the aircraft is confirmed to be an enemy and tracks the aircraft using its guidance system (usually based on homing guidance). Take, for example, the RIM-174 Extended Range Active Missile, a SAM operated by U.S. Navy ships. The RIM-174 relies on active homing guidance technology once it has launched against a confirmed enemy aircraft.

Missiles in Recent Conflicts

The Persian Gulf War: 1990–1991

Apart from powerful intercontinental ballistic missiles with nuclear capability, many other missile types have held enormous value in recent conflicts. In Operation Desert Storm, the cruiser USS *San Jacinto* fired the first two combat-tested BGM-109 Tomahawk cruise missiles against key Iraqi targets. Soon after, the battleships USS *Missouri* and USS *Wisconsin* fired Tomahawk missiles as well. The Tomahawk system proved a success as the strikes destroyed important Iraqi command and control units, as well as communication centers. The submarines USS *Louisiana* and USS *Pittsburgh* also fired Tomahawk cruise missiles (called submarine-launched cruise missiles, or SLCMs) in support of Operation Desert Storm. In total, 288 Tomahawk missiles would be fired from U.S. ships against Iraqi targets by the end of the Gulf War.

Starting in January 1991, the United States began an extensive bombing campaign on Iraqi soil. Before the war began, Iraq had stated that should it be directly attacked, missiles would be fired against Israel. The Iraqi leadership under Saddam Hussein held to their promise—mere hours after the first bombings, Iraq launched Al Hussein missiles (upgraded Soviet-made Scud missiles). During the remainder of the war, Iraq would launch 88 Al Hussein missiles against both Israel and Saudi Arabia. To intercept and prevent the Al Hussein missiles, the United States launched its Patriot missiles—a missile interception system. While the system was not wildly effective, it did manage to provide defensive value as it prevented some missiles from reaching their intended targets.

During the Persian Gulf War, the U.S. Air Force and the U.S. Navy deployed F-4 Phantoms and F-18 Hornets, respectively, each equipped with AGM-88 HARM missiles, an antiradiation missile that can reach speeds up to Mach 2, against Iraqi SAM sites. This tactic greatly limited Iraq's air defense, drastically weakening its military defensive posture. With air superiority in the U.S. Air Force's and U.S. Navy's hands, the U.S. Army employed AGM-114 Hellfire missiles fired from AH-1 SuperCobras and AH-64 Apaches against Iraqi Republican Guard tanks. The Iraqi armor divisions had little ability to resist the aerial attacks and as such faced heavy losses. This total force effect—with American-operated missiles giving a clear tactical advantage—defeated the Iraqi forces and sent them into retreat.

Operation Enduring Freedom: 2001 to the Present

Within Afghanistan, the United States used a combination of old and new missile technology to accomplish its intended mission. Aircraft launched missiles, including the AGM-114 Hellfire, AGM-88 HARM, and the AGM-158 joint air-to-surface standoff missile. The AGM-158 is a cruise missile with standoff capability—this means the missile can be fired from a far distance, ensuring that the launch platform and operator are not within an opponent's reach. The missile can be carried by the F-15, the F-16, the F-18, the F-35, the B-1, the B-2, and the B-52, making it a highly versatile missile system. AGM-114 Hellfire missiles were increasingly deployed on unmanned aerial systems (UAS for short; includes aircraft such as the MQ-1 Predator and the MQ-9 Reaper), a development that has increasingly shaped missile use in the continuing war against al Qaeda.

On the ground, the U.S. Marine Corps employed the FGM-172 Short-Range Assault Weapon. The FGM-172 can be hand carried and requires little to no assembly as it is a shoulder-mounted tube containing a single missile that altogether weighs only 21 pounds. The effectiveness of the short-range assault weapon has been proven time and again against insurgent forces in Afghanistan, especially since it has been widely upgraded to the FGM-172B, which specializes in urban combat. As the conflict in Afghanistan and other regions continues, the types and upgrades to missile designs will follow for both the U.S.-led coalition and the terrorist threat standing against them.

Operation Iraqi Freedom: 2003–2011

During the war in Iraq, a variety of missile weapon systems proved their effectiveness against the Iraqi military and the insurgency that followed. The AGM-65 Maverick is one such AGM. The AGM-65 is used primarily to eliminate armored ground targets and is operated by a combination of assault helicopters, such as the AH-1 or the AH-64, as well as fighter-bomber type aircraft, including the F-15, the F-16, the F-18, and the A-10.

When the U.S. Army had to handle Iraqi ground forces during the initial invasion of Iraq in 2003, they employed the FGM-148 Javelin antitank missile. The missile was quite effective against Iraqi Type 69 and Lion of Babylon tanks. Once Baghdad was secured, the Javelin missile system further aided U.S. Army troops with holding the key city.

The missile technology used by air- and land-based forces has been quite effective in recent conflicts. The greatest development in conventional missile technology during recent conflicts, however, has been the rise of the UAS. The UAS allows for conventional missile systems to be launched from an unmanned aerial position, affording the United States and its allies the ability to keep airmen out of harm's way and maintaining stealth while still posing a tremendous threat to the opponent. UASs including the MQ-1 Predator, the MQ-9 Reaper, and the MQ-1C Warrior have been utilized to attack ground targets in Afghanistan, Pakistan, and Yemen in recent years and appear destined to play an increasing role in continued U.S. operations. Many missile systems used on manned aircraft can also be deployed on UASs, including the AGM-114 Hellfire and the AGM-88 HARM missiles, both of which aid ground forces in attacking targets and can take out key structures to ensure air superiority.

MISSILES, CRUISE

A cruise missile is a guided missile, usually propelled by a jet engine, armed with a conventional or nuclear warhead, that attack targets over long distances with high accuracy. This entry describes the development and features of cruise missiles worldwide.

General Description

Cruise missiles generally have a guidance system, warhead, and propulsion system inside of an airframe that has small wings and a tail assembly for lift and stability. The propulsion system is usually a turbofan jet engine. Cruise missiles can carry a conventional, nuclear, chemical, or biological warhead or submunitions, weighing about 1,000 pounds, at supersonic or high subsonic speeds on a nonballistic, extremely low-altitude trajectory. Cruise missiles have a range of less than 105 kilometers (65 miles) up to 3,000 kilometers (1,864 miles).

Cruise missiles utilize a variety of navigation systems to guide them to their target. The “low in” systems consist of a radar altimeter, barometric altimeter, and clock to navigate a digital strip map. More advanced systems use inertial guidance, NAVSTAR Global Positioning System satellite signals, or terrain contour matching guidance. These highly accurate guidance systems enable the cruise missile to conduct highly precise strikes.

Origins and Development

The cruise missile originated with the “aerial torpedo,” developed by Lawrence Sperry in 1916. He placed an explosive charge, an autopilot, and a barometric altitude control in a small biplane. The next year, Charles Kettering developed the Kettering Bug, similar to Sperry’s device, for the U.S. Army Signal Corps. The war ended before the “Bug” could enter combat. Kettering continued development until 1920 when the Army Air Corps terminated funding.

Between 1927 and 1929, Britain tested the Larynx (Long Range Gun with Lynx Engine) as a guided antiship weapon. The Soviet Union experimented with the GIRD-06 cruise missile from 1932 to 1939. Both the U.S. Army and Navy conducted limited testing of radio-controlled aircraft in the interwar years.

During World War II, Germany developed the *Veltungswaffe* (Vengeance Weapon 1 or V-1), the immediate ancestor of today’s cruise missile. The V-1 used a gyroscopic guidance system. The buzz-like sound of its pulse-jet engine earned the weapon the nickname of “buzz bomb.” Between June 1944 and March 1945, the Germans launched 9,521 of the highly inaccurate V-1s at southeast England and western Belgium, causing nearly 23,000 casualties. In 1943, a German submarine delivered a pulse-jet engine to Japan, which developed a design for a piloted V-1, called the *Biaka* (“Blossom”). However, it never left the design phase.

Between 1944 and 1949, the U.S. Army Air Forces worked on 21 different guided missile projects, including the Jet Bomb 2, nicknamed “Loon,” an American version of the V-1. By 1948, the newly created U.S. Air Force had cancelled all of these projects except for the BANSHEE, the SM-62 Snark, the SM-64 Navaho, and the MGM-1 Matador. Over the next decades, advances in transistor and computer technology produced self-correcting avionics and aeronautical designs that allowed ground stations to guide missiles in flight and, eventually, the modern cruise missile.

During the Cold War, both the United States and the Soviet Union continued to develop increasingly more advanced cruise missiles. The U.S. Air Force operated its first operational surface-to-surface missile—the winged, mobile, and nuclear-capable MGM-1 Matador—between 1953 and 1962. The U.S. Navy

deployed the submarine-launched SSM-N-8 Regulus missile from 1955 to 1964.

The Soviet Union preferred ballistic missiles to strike land targets, but it developed heavy nuclear- and conventional-tipped cruise missiles to attack U.S. carrier battle groups. It developed large submarines to carry these weapons and shadow U.S. battle groups at sea, and large bombers, such as the Backfire, Bear, and Blackjack, to carry the air-launched cruise missile variant.

Current Cruise Missiles

Today, the United States possesses several types of cruise missiles. The navy's BGM-109 Tomahawk, costing about \$600,000 each and launched from ships and submarines, is an extremely accurate, long-range, conventional land attack weapon. U.S. Air Force bombers carry the conventional- and nuclear-tipped air launched AGM-86 version. U.S. military forces used both the BGM-109 and AGM-86 extensively during Operation Desert Storm in February 1991.

The AGM-84 Harpoon cruise missile comes in air-, ship-, and submarine-launched variants for use against ships and land targets. The Harpoon has a low-level cruise trajectory with an over-the-horizon range that makes it less susceptible to radar detection.

In the late 1970s, the U.S. Air Force developed the AGM-109 ground-launched cruise missile for launch from trucks and deployed them to Europe to offset the Warsaw Pact's numerical superiority. In 1987, the U.S. president Ronald Reagan and the Soviet premier Mikhail Gorbachev signed the Intermediate-Range Nuclear Forces Treaty, which resulted in the removal from Europe and destruction of the ground-launched cruise missiles (as well as the U.S. Army's Pershing II missiles and the Soviets' SS-20 intermediate-range ballistic missiles).

The United States also developed the AGM-129 advanced cruise missile with a small nuclear warhead for external carry by the B-52 Stratofortress. The navy acquired a sea-launched version. The United States has since placed these missiles in storage.

The nuclear submarines of the Royal Navy carry the U.S.-made Tomahawk. Several fired conventional versions during the 1999 Kosovo War. The Royal Air Force uses the Storm Shadow cruise missile on

its Tornado GR4 aircraft. The Mirage 2000 and Rafale aircraft of the French air force also carry the Tomahawk, known in France as SCALP EG.

India and Russia jointly developed the BrahMos ship-, land-, air-, and submarine-launched supersonic cruise missile. Russia also operates the SS-N-12 Sandbox, SS-N-19 Shipwreck, SS-N-22 Sunburn, and SS-N-25 Switchblade cruise missiles. Germany and Spain use the Taurus missile, and Pakistan developed its own cruise missile, the Babur, which is somewhat similar to the Tomahawk. The People's Republic of China, the Republic of China (Taiwan), France, Israel, Italy, Japan, Norway, and Sweden have also developed their own cruise missiles. Most of the countries that have produced their own cruise missiles have exported their versions to numerous other countries.

Because cruise missiles are among the most expensive single-use weapons today, military planners usually use them to attack high-value or heavily defended targets. As a result, commanders normally avoid using them on low-value targets, such as certain targets during Operation Enduring Freedom. When such instances did occur, critics have questioned the weapon's efficiency versus cost. Cruise missile proponents use a similar argument about unmanned aerial vehicles in comparison to manned aircraft. Additionally, with their small radar cross section, cruise missiles are much more difficult to detect and intercept than manned aircraft, making them particularly suited for attacks against static air defense systems or heavily defended targets.

MISSILES, NUCLEAR

Nuclear missiles are self-propelled rockets used to deliver nuclear warheads. Although the term can be applied to any missile equipped to carry nuclear warheads, *nuclear missiles* are most commonly associated with ballistic missiles. Ballistic missiles are missiles that are launched into suborbital space and then free fall on their preprogrammed targets with inertial or stellar guidance systems. The most common nuclear missiles are (a) intercontinental ballistic missiles (ICBMs), (b) intermediate-range ballistic missiles (IRBMs), (c) medium-range ballistic missiles (MRBMs), and (d) submarine-launched ballistic missiles (SLBMs). ICBMs and SLBMs make up two thirds of the nuclear triad—the collection of land-, ground-, and sea-based nuclear weapons used to conduct nuclear war. This entry examines the design and delivery systems of U.S. and Soviet Cold War-era nuclear missiles and discusses present-day concerns regarding nuclear missile security.

Nuclear missile development originated from German rocket technology advances made throughout World War II. Bolstered by the capture of German missile facilities and engineers, both Americans and Soviets began their foray into ballistic missile development. It was believed that merging the power of atomic bombs with the benefits of a long-range missile could create a highly destructive weapon. Unfortunately, size and weight limitations posed by early atomic weapons made such missile delivery impossible. In addition to engineering limitations, a preference for manned bombers persisted within the U.S. military culture and created further bureaucratic delays in funding and development. Despite these obstacles, by the early 1950s for the United States and the late 1950s for the Soviets, technological developments in thermonuclear warhead design achieved lighter and more accurate warheads.

U.S. Nuclear Missiles

Early U.S. development of nuclear missiles focused on all manner of sizes, delivery systems, and warhead designs. However, most of these development efforts gave way to the ICBM. The ICBM had the advantage of striking long distances in a short amount of time (15–30 minutes) and traveled at upward of 15,000 miles per hour, making it nearly

impossible to defend against. Also, ICBMs had the advantage of being based domestically and required fewer personnel to operate, resulting in cost savings and increased security. The first U.S. ICBM was the Atlas (D, E, F) 1½ stage liquid-fueled missile with a single warhead. The next ICBM development was the Titan (I and II) missile, which was liquid fueled and carried warheads up to 10 megatons. The next and most enduring ICBM was the Minuteman (I, II, III). The Minuteman missile provided two significant technological advances over previous designs. First, it operated on a solid fuel propellant, which allowed the missile to remain fully fueled at all times. Due to the instability of liquid fuel, Atlas and Titan missiles had to be fueled once the launch order was given causing additional delay in launching and making them vulnerable to first-strike attack. The Minuteman also made use of the newly developed multiple individually targeted reentry vehicle (MIRV) technology. The MIRV allowed a single missile to carry multiple warheads, each programmed to hit a different target. The final ICBM development was the Peacekeeper (or MX). The Peacekeeper had many advances, most notably its ability to deliver 10 warheads. However, due to policy implementation, the Peacekeeper never made it into the operational force. The Strategic Arms Limitations Talks and Strategic Arms Reduction Treaty nuclear reduction treaties eliminated all but 500 Minuteman III missiles from the U.S. arsenal.

Advances in warhead design, fuel options, and a desire to remain competitive within the evolving nuclear strategy doctrine brought the U.S. Navy to develop sea-based nuclear missile capabilities in the latter half of the 1950s. This led to the development of SLBMs. The stealth nature and mobility of submarines gave SLBMs an advantage over land-based missiles in that they were not susceptible to a first-strike attack by an enemy. The drawbacks to SLBMs were that they were costly to maintain and had smaller and less accurate warheads than ICBMs.

Early U.S. attempts at SLBMs, based on liquid-fueled missiles, did not fare well. Dealing with highly unstable liquid fuel aboard a submarine proved to be difficult. However, the advent of solid-fuel propellants made SLBMs more practical. The navy developed several iterations of SLBMs. The first incarnation, the Polaris missile, which had a limited range and a small warhead, was completed in 1959. The second SLBM, the Poseidon, which
